In the same magazine Sir Claude Phillips makes out a strong case for the attribution of the "Temperance," of the Diploma gallery at the Royal Academy, to Palma. The picture is labelled "Gorgione," but critics fathered it here and there, as happens so often nowadays. Whether this attribution is final remains to be seen. The picture is a fine one, simple in composition, with all the characteristics of the Venetians and particularly those of Palma, as Sir Claude Phillips points out.

Articles on the Italian Sculpture at the Burlington Fine Arts Club by Mr. A. M. Daniel, and in continuation of the series on Early Furniture, by Mr. Aymer Vallance, F.S.A., are also contributed.

A reproduction of a fine painting by Jan Vermeer, of Delft, showing a view of that city

forms the frontispiece to the *Connoisseur*. Mr. M. H. Spielmann contributes an article on "Pictures of Picture Galleries," one of the illustrations of which shows the interior of the British Institution, Pall Mall, by J. Scarlett Davis, a painter who lived in the first half of the XIXth century. The other illustrations are the pictures which can be seen in little in the view.

"Liverpool Potteries and Their Productions," by Mr. H. G. C. Day, and the third article on the London Museum, by Miss Ethel M. M. McKenna, also in the *Connoisseur*, are well worth perusal. Dr. G. C. Williamson's note on Jean and Pierre Condé points out that the engravers were brothers, not father and son, as is commonly supposed. These articles are all well illustrated. There is also a good colour reproduction of a picture by the Rev. M. W. Peters of "Mrs. Page and Mrs. Ford Reading Falstaff's Love Letters."

The *Antiquary* notes several exhibitions of Egyptian antiquities. Among the finds is mentioned a monolith alabaster sphinx, 27 ft. long and 14 ft. high, which was excavated at Memphis. It weighs about 80 tons, and was by its very size precluded from being removed from Egypt.

Moral sensibilities do not seem to have troubled the archaeologist who found it. However, it is to remain in Egypt and will be placed in its true position, where it will become one of the sights of the country, being second in size to the great Sphinx itself. The same magazine contains the beginning of an article on the ornament called "Honey-suckle," the beauty and value of which can scarcely be over-estimated. The writer at the outset quotes from Fergusson, who says:—"It is perhaps the most beautiful and perfect of ornaments derived from vegetable forms, which the Greeks borrowed from the Assyrians, but made so peculiarly their own." We remember ourselves the surprise caused by the first look at this ornament, an example from the Erechtheum, with a mind biased by a long study of Gothic ornament. Its delicacy of design, its freshness, the wonderful cutting, the beauty of the material itself combined to open up a new vista in art. The writer shows how the Greeks used this ornament, as Stela, as Antefix, or as Frieze. The concluding part will trace its early history before it was introduced into Greece.

An article by Mr. Arthur E. P. B. Weigall in the *Nineteenth Century* may be noticed familiarly in these pages. It is called "The Morality of Excavation," and is an answer to the often-repeated question, "Why is it that the excavation of ancient tombs is permitted?" So there are people to whom it is an offence that Egyptian tombs should be excavated just as there are those to whom vivisection appears a crime. Yet to defend either practice on moral grounds is difficult, for the first, after all amounts to desecration, and the second seems to inflict pain, which in itself cannot be defended, on dumb animals. Is it right to do evil that good may come of it? Mr. Weigall himself admits that his arguments may be considered "to be those of a casuist, as no doubt they will be by a certain class of readers." But to produce his arguments:—"The careful opening of an ancient Egyptian sepulchre saves for science information and antiquities which otherwise would inevitably be scattered to the four winds of heaven by native plunderers. In spite of the strenuous efforts of the Department of Antiquities, a considerable amount of robbery takes place. . . . Tombs are rifled, coffins are broken open, mummies torn to pieces in the search for gold. . . . It will be easy for the reader to picture in his mind the disorder of a plundered tomb. There lies the overturned sarcophagus, there sprawls the dead body with the head rent from the shoulders, there are the shattered remains of priceless vases. . . . It is as though the place had been visited as full moon by demented monkeys." He compares this procedure with that of the trained Egyptologist who records in every dimension, with notes, photographs, and drawings, every tomb he opens, who handles everything he touches with knowledge, and who in his dealings with the dead observes "a rough decency."

"Which, then, is the better course: to leave the tombs to be rifled by ignorant thieves, or to clear them of their contents in an orderly manner?" Whether we should like to add, would one have one's house burgled by some scientific "Raffles" or by a mere tramp? We should have thought it infinitely less expensive to guard the tombs adequately than to excavate them, had it been thought advisable to do so. That is the first argument. The second

proceeds that if no illegal robbery was feared, can it be justified—thus to the oblivion? The writer shows how precious great part of our knowledge of the ancient Egypt has been gained from which are gathered together, but a few from the living, in cities given over to the dead—cities whose austere state such woeful contrast to the fertility of Valley. For no blade of grass or breaks the aridity of the limestone of Egypt, where the dead of countless. From the sepulchres all articles of economy have been taken, "bed tables, boxes, chests, vases, utensils, clothing, jewellery, and so forth." Such objects that we see in museums, which I had to deal during my tenure of office. So that without excavation we are so much poorer in our knowledge of antique race. So much for argument not seem to bear very close inspection, however, gives the real gist of it when he says:—"The study of Egyptian political necessity, and for this reason tombs must be opened and their contents recorded." He quotes from a letter Cromer:—"Incidents in ancient history frequently brought to my mind the which I had to deal during my tenure of office in Egypt." That is perhaps sufficient, the rest the article gives an extremely account of the procedure of the archaeologist.

THE CATHEDRALS AND CHURCHES OF ENGLAND AND SOUTHERN ITALY. By T. Francis Fry. London: T. Werner Laurie. 16s.

FIFTY YEARS AGO.

From the *Builder* of August 23rd 1850.

An Underground Railway for London.

WHEN the Prince Napoleon was lately he went over the underground, and on his return to Paris he returned strongly in favour of it that there has already, it is said, ordered a suburban line from Montmartre to the Louvre commenced forthwith, and has been Mr. Fowler consulting engineer in the undertaking.

** When the above was written the Metropolitan Railway was not quite open to public traffic; only a section (from Bishop's-road to Long-street) existed, and it was popularly known as a somewhat sensational "Montmartre-Louvre Line" was not yet taken up with some enthusiasm. Now the French engineers have far; the Paris Metropolitan alone, inaugurated in 1900, has in thirty years or so that have elapsed since they were begun, dealt with the construction of about 90 miles of line, in the which many and varied difficulties have been overcome. As instances we may mention that, in the branch under the Railway, the tunnel works were from the inflow of water from the freezing the ground so as to form ice some 70 yds. long, and that the tunnels across the Seine, a somewhat method of construction was used, iron segments of the lining being laid on the river bed and there jointed by external concrete patches, the water then pumped out and the permanent connexions made. This method of the risks of working with "shallow" allows the tunnel to be much nearer the than would otherwise be possible.

A NEW MODELLING STUDIO.

The advantages of the architect in representing a proposed new addition to an existing structure, and we may call attention to some at the Gray's Inn Modelling Studio, Gray's Inn-road, Mr. S. Lloyd Jones, the principal. The firm have a Shortlands, Kent.

MONTHLY REVIEW · of · ENGINEERING.

The London and South-Western Bank, Gracechurch-street and Fenchurch-street, E.C.

Mr. Edward Gabriel, A.R.I.B.A., of Messrs. Edmeston & Gabriel, Architect.

HEAD OFFICE OF THE LONDON AND SOUTH-WESTERN BANK.

On the issue of August 9 illustrations and description appeared of the new building on Lombard-street for the Royal Insurance Company. A short distance away another building has been completed recently, and will be seen by the accompanying illustrations from photographs, the Head Office of the London and South-Western Bank of its purpose. Mr. Edward Gabriel, architect, and the bank was opened by the Lord Mayor in May. Unfortunately the building is not available; but the illustrations with the subjoined particulars, will give an idea of the building.

The portion of the bank, consisting of Nos. 169, and 170, Fenchurch-street, Nos. 70, Gracechurch-street, and Ingram-street built in 1886.

Nos. 171, 172, and 173, Fenchurch-street, were added to the bank property and in 1909, the directors, having Nos. 66, 67, and 71, Gracechurch-street, the whole of the important site at the corner of Lombard-street, comprising an area of 1,000 ft. super, with a total frontage of 100 ft. towards Fenchurch-street, and 100 ft. towards Ingram-street, have now been remodelled and

rebuilt on this extensive site. The work has been carried out in sections under considerable difficulties, as the business of the bank has had to be carried on without interruption, and a large number of tenants occupying the upper parts of the buildings have remained in occupation during the progress of the works.

The front elevation is in Portland stone, with a polished granite base to the height of the ground-floor window-sills.

The whole of the ground floor is occupied by the banking hall. The main entrance is at the corner opposite Lombard-street, with a subsidiary entrance in Gracechurch-street, which also forms the entrance to the upper floors of the building. There is a separate entrance to the foreign branch in Ingram-courtyard.

The basement and sub-basement contain strong-rooms, store-rooms, cloak-rooms, and lavatories, heating apparatus, and also a pump-room in connexion with the artesian well which has been sunk on the site.

The first floor contains the general manager's rooms, conference-rooms, waiting-rooms, accountants' branch loans and inspection, board-room and ante-room, secretary's department, and a large number of private offices.

The second floor contains solicitors', trustees', and inspectors' departments, and this floor together with the third floor contains a large

number of tenants' offices with ample lavatory accommodation.

The fourth floor contains a large dining-room, smoking-room, kitchen, scullery, and offices, housekeeper's apartments, and tenants' offices.

The whole of the banking-hall fittings and screens have been specially designed by the architect, and have been carried out by Messrs. Hibberd Bros.

The marble lining to the walls of the banking hall and the Scagliola columns were carried out by Messrs. Bellman, Ivey, & Carter, Ltd. The walls above dado height are covered with carefully-selected "Arni Alto." The Scagliola columns (of which there are over thirty) have the shafts divided by bronze annulets. The enriched Ionic capitals were also modelled and cast by Messrs. Bellman, Ivey, & Carter, Ltd., and are bronzed with pure copper by their special process. The whole of these columns were cut and fixed round steel stanchions without showing joints.

The Acme Flooring and Paving Company laid the banking hall, dining-rooms, and offices with Duffy's patent "Immovable-Acme" wood-block flooring in 1½-in. oak, D quality. This flooring has been supplied and laid by the company in nearly fifty branches of the London and South-Western Bank.

The main staircase is of marble, carried out by the Art Pavements and Decorations, Ltd.

The London and South-Western Bank, E.C.: The Banking Hall.

Mr. Edward Gabriel, A.R.I.B.A., Architect.

The treads and risers are of Sicilian marble, the handrail and plinth of Grand Antique, and the balusters of Pavonazzo. The dado is a Tinos green, with moulded capping and skirting in Grand Antique, with overwall in Arni Alto fixed ashlar. The columns and pilasters are in Greek Cippolina.

Two of Messrs. Waygood's lifts are installed in the building, one an electric passenger lift to take 15 cwt. or ten persons at 300 ft. a minute through a travel of 65 ft. 6 in. The control of the lift is by a car switch and self-centring detachable handle in the cage, as on the tube. The lift is also fitted with a special slowing-down device and patent automatic cut-off current in the event of the lift exceeding the travel at top or bottom. There is also one hydraulic book lift, travel from basement to ground floor, and constructed for a load of 10 cwt. This lift is worked by hydraulic power from the mains of the Hydraulic Power Company.

Heating is obtained by means of low-pressure hot water with accelerated circulation. The apparatus has been supplied by Messrs. J. Jeffreys & Co., Ltd. The mechanical circulation is effected by means of a motor-driven centrifugal pump.

The work of the British Luxfer Prism Syndicate, Ltd., included patent roof glazing to the covered way, gunmetal frames in doors, and fire-resisting glazing in doors and screens.

Messrs. Ewart & Son, Ltd., executed the copperwork on the dome, the roof, the flats, and elsewhere through the building.

The sanitary fittings were supplied by Messrs. J. Tylor & Sons, Ltd.

Among the other sub-contractors were the following:—Messrs. Richard Moreland & Sons (constructional steelwork and floors); Messrs. Spital & Clark (counter grilles and cashiers' desks); Messrs. G. & A. Brown (ornamental plasterwork); Messrs. Milner & Co. and Messrs. Chubb & Sons (strong-room doors, safes, and strong-room fittings); Messrs. Fenning & Co.

(granitework); Messrs. Mossop & Co. (electric light and bells); Messrs. Chas. Smith, Sons, & Co. and Messrs. A. Jones & Co. (ironmongery); Messrs. Crittall & Co. (metal casements and steel cupboards); Messrs. Richardson & Co. (metal shelving); Messrs. John Hall & Sons (glazing); Messrs. Alfred Williams & Co. (artesian well and pump); Messrs. Merryweather & Sons (hydrants and fire appliances); Messrs. Brawn & Co. (bronze name-plates); Messrs. Pridmore & Co. (ornamental balustrading); Messrs. Stodge & Co. (lift enclosure); the Albion Iron Company and Messrs. Thos. Elsley & Co. (stoves and mantels); Messrs. Benham & Sons (cooking plant); Messrs. H. W. Cashmore & Co. (ceremonial key).

The whole of the rebuilding has been carried out by Messrs. Howell J. Williams & Co. Mr. Peacock has acted as clerk of works.

DANGERS ATTENDING DEEP EXCAVATION.

In our "Notes" of March 13 and July 10, 1909, we commented upon the disastrous failures connected with excavation works at Birkenhead and Newport docks, and on the latter date suggested the desirability of official inquiry into the question generally.

The Report has just been issued of the Home Office Departmental Committee appointed in 1909 to "inquire into the dangers attending deep excavation in connexion with the construction of docks and similar works." This Committee included Mr. H. J. Wilson, one of H.M. Inspectors of Factories, Mr. C. A. Harrison, D.Sc., of the North-Eastern Railway, and Mr. W. W. Squire, M.Inst.C.E., of the Bristol Docks Committee.

Fortunately, there have not been many serious collapses of timber-work structures in excavations such as those made at Birkenhead and Newport. This fact in itself had the effect of handicapping the Home Office Committee in their inquiry. The only statistics available

relative to fatal accidents are those furnished to the Committee by various corporations and dock authorities. The figures for a period of about twenty years, after analysis, show that the deaths due to trenching or dams represent about 10 per cent. of the total number of fatalities in or about the class in question.

After due consideration the Committee have not found it practicable to make special recommendations for the prevention of timbering in deep trenches. They are of opinion, however, that it is natural, for the forces to be resisted in such cases, and in consequence it is not possible to formulate any standard series of rules.

Moreover, as the work of excavation is constantly changing and developing, the conditions may change and demand modifications in the original recommendations. It may be that the entire scheme of excavation works will have to be considered. Therefore, so far as general desiderata are concerned the engineering contractor must remain responsible.

The definite recommendations proposed in the report are of minor character, and in our opinion the official statistics and regulations based on the proper consideration would have a distinct effect.

As a matter of convenience we have set out the recommendations briefly as follows.

Wherever practicable, the edges of excavations and gangways shall be guarded by rails or fences, and skirting boards shall be provided to prevent material from falling to the bottom and causing injury to the men.

A sufficient number of ladders shall be provided to enable the men to escape in an emergency.

Ladders shall be arranged with their top ends at least 3 ft. 6 in. above the level of the ground, and shall be lashed rather than with ropes.

to artificial lighting shall be used in cases of darkness.

regulations under the Factory and Workshop Act dealing with the use of electricity, the use of chains, and the examination of boilers shall apply to deep excavations. The ambulance appliances shall be

shall be inspected in detail by a person once a day, and a register of inspection shall be kept which shall be the inspection of H.M. Inspector of

of explosives shall be controlled by the rules given in the Report, and which are the rules already applying to quarries. blasting in timbered excavations, all material deposited on struts and horizontal shall be swept down and the timber examined.

the point in connexion with engineering the character dealt with in the report they are not governed in any way by the Acts relating to accidents and

Factory and Workshops Act of 1901 appear to apply to machinery outside erected for the purposes of dock work, and the Notices of Accidents Act has been modified so that accidents in the construction of a harbour, dock, or quay need not be reported to the Trade as originally enacted.

NEW YORK SEWAGE DISPOSAL.

Third Report of the Metropolitan Commission of New York relates to the disposal of sewage of the New York Bay district.

the two preceding Reports, the Commission recommended the subdivision of New

York into sewage districts in order to facilitate the design for an efficient system of main drainage.

The proposal is that the sewage of each district shall be dealt with separately, with provision for combining the systems in case this should appear to be desirable at any future time.

In the Report now issued the scheme for the Jamaica Bay section is described and illustrated by plans.

Jamaica Bay, as our readers may be aware, is a land-locked arm of the sea on the south of Long Island, and its shores are occupied by holiday resorts such as Rockaway Beach and Coney Island. Its waters are devoted mainly to bathing, boating, and the cultivation of shellfish.

It is highly probable that the character of Jamaica Bay will be radically altered not only by the system of sewage disposal proposed by the Commission, but also by the contemplated use of the bay as an additional ocean harbour for New York.

So far as drainage is concerned, it is proposed to collect sewage by the separate system as far as possible, with allowance for the inflow of ground water. In places where the sewers are designed on the combined system the dry-weather flow only will be intercepted, with storm-water overflows above the points of interception.

Thus, for a considerable proportion of every year vast quantities of crude sewage will be discharged into the bay, and even the sewage intercepted in dry weather will not be treated so as to insure thorough purification.

The sewage disposal works foreshadowed in the Report merely include sedimentation tanks, sprinkler filters, and settling basins, and the sludge will either be used to fill in marshland, or "dumped at sea," the latter alternative being obviously the only one that ought to be seriously considered.

The proposals relate to the development of the bay as a second harbour for New York

emanate from the Jamaica Bay Improvement Commission appointed by the United States Government and the Municipal Council of New York.

Plans have been officially adopted, and money appropriated for the formation of a substantial and regular water front, deep-water channels for ocean steamers, harbour approaches at Jamaica inlet, and canals, each from 300 ft. to 400 ft. wide and from 4,500 ft. to 12,000 ft. long, for development of the water front. The object of these works is to provide for the establishment of what will virtually constitute a large new seaport.

The development of the bay in this manner must ultimately cause pleasure seekers to find some more secluded resort, and the shellfish industry will also have to go, especially in view of the crude arrangements at present contemplated for the treatment and disposal of sewage.

INTERLOCKING REINFORCED SLABS.

An invention relating to the application of reinforced concrete in maritime engineering, irrigation works, and for other purposes, has recently been introduced by the Patent Interlocking Slab Company, of Oakley House, Bloomsbury-street, W.C.

The slabs are of reinforced concrete with overlapping or interlocking lips, forming tongued and grooved connexions between adjoining slabs. All the interlocking projections are perforated vertically so that when several slabs have been assembled they can be locked together by means of a cylindrical pile or column.

Fig. 1. Interlocking Slabs.

Fig. 1 shows in perspective the adjacent interlocking ends of two slabs—*a* is the body of the slab; *b* and *b'* are the interlocking projections, each with a tongue *c* locking into the groove *d*; and *e* is the vertical perforation in the projecting part of the slab.

The slabs can be reinforced in any suitable manner to suit requirements, and the projections perforated for piles or columns of any required cross-section.

If desired, the upper and lower faces of the slabs can be ribbed, grooved, or recessed to make sound horizontal points, and the slabs can be moulded of any length, height, or shape.

It will be seen, therefore, that the invention provides for all reasonable variations of construction, and, as no restriction is made by the patentees as to the system of reinforcement to be adopted, the slabs can be designed by any reinforced concrete specialist or independent engineer.

Fig. 2. Elevation of Typical Groyne.

Fig. 2 illustrates part of a groyne constructed with interlocking slabs, some keyed together by means of piles, and others by columns with ordinary footings.

Fig. 3 shows three methods of applying the slabs in the construction of sea-walls. If the soil is firm, the wall can be carried by a footing of plain concrete, as shown in the first section. If the soil is of unstable character, the employment of piles is recommended in accordance with the second and third sections. It will be noted that the slabs form a watertight lining behind the masonry of the wall.

The London and South-Western Bank, E.C.: Main Staircase. First Floor.

Mr. Edward Gabriel, A.R.I.B.A., Architect.

Fig. 3. Typical Sections as applied to Seawall Slabs supported by Reinforced Concrete Piles.

The slabs can be similarly used in the construction of river training walls, canal banks, dams, and kindred structures.

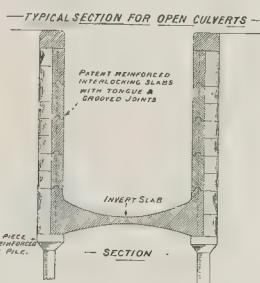

Fig. 4.

Fig. 4 is a typical section of an open culvert carried upon reinforced concrete piles, the culvert walls being formed of interlocking slabs, and the invert moulded in one piece. If desired, the culvert can be built upon columns above ground level so as to form an aqueduct.

Fig. 5.

Fig. 5 represents interlocking slabs of curved shape for chimney-shafts or for shafts of any kind below the surface of the ground.

The foregoing illustrations will serve the purpose of indicating some of the many uses to which this ingenious invention can be applied in constructive work.

ENGINEERING NOTES.

Reinforced Concrete Floor Test.
The British Fire Prevention Committee undertook some supplementary loading tests with a reinforced concrete floor (submitted by the United States Steel Products Company) which had been under fire and water test on July 24th last, the fire and water test having been a four-hour one, and the standard of "Full Protection" Class B having been obtained. "Triangle mesh" was used as reinforcing material. The centre bay of the floor, measuring about 15 ft. by 7 ft. and being 5 in. thick, was to be loaded to 5 cwt. per foot super., and records were to be taken of the deflection at certain intervals, the object of the test being to show that a floor of this type is still serviceable after a severe fire. The tests were conducted by a sub-committee under the direction of Mr. Max Clarke, F.R.I.B.A. During the afternoon various other materials which had been under fire test during July were also exhibited.

Results of Tests.—The British Fire Prevention Committee announce that a series of fire tests with the flame-proofing of textiles treated by the Snowdon process have resulted in the process being classified as making the materials under review "non-flaming," which means that less than 5 per cent. of a square yard of treated material burns in sixty seconds on the application of flame. The materials under review treated by the Snowdon process were scenic canvas (for theatres), curtain net and art muslin (as used in bazaars), and flannelette. Wadding and thin paper (as used by drapers for Christmas decorations), treated by the same process, likewise obtained this classification in some supplementary tests.

Impending Tests.—The Committee's official fire-tests with "Cellit," a non-inflammable celluloid, will take place at the end of September, and the tests with asbestos cement roofing materials early in October, when there will also be further fire tests with glazing.

No Matter how carefully a fire resistance building may be subdivided by walls or partitions for the purpose of checking the spread of fire, such precautions are of little avail unless openings are closed by efficient doors or shutters, the importance of which in other situations is equally evident.

For some ten years past the British Fire Prevention Committee have been investigating the fire resistance of doors and shutters, both those in ordinary use and those covered by patent rights.

A publication issued as No. VII. of the *Journal* of the Committee summarises the results of fifty-eight tests in the form of four tables, in two categories relating to full and temporary protection respectively.

It should be understood that the tables in question are merely intended as summaries, and that reference to the original reports is advisable wherever detailed information is desired.

Nevertheless, the tables should be found useful as a guide both to architects and to others controlling building operations. The tables are very conveniently arranged and are illustrated by diagrams, with figured dimensions, showing the main features of each construction tested.

Irrigation in Madras.

SO MUCH has been written on the Nile dams and allied works for irrigation purposes that the equally important undertakings of the same nature in other, but less advertised, countries scarcely receive the attention that is their due.

As one instance we may cite the irrigation system of the Madras Presidency, where the areas supplied with water by the major productive works aggregate 3,042,189 acres for first crop and 384,684 acres for second crop, or more than half the cultivable area of land in the whole of Egypt proper.

Two of the most important undertakings in Madras are the Kistna delta system supplying some 712,500 acres for first crop and the Divi Island system providing for the ultimate irrigation, by pumping, of 80,000 acres.

According to the report for the year ended December 31 last, the major productive works of Madras Presidency show a return of 9.07 per cent. on the total capital outlay, and a net profit of 5.91 per cent. after deducting interest.

Reinforced Concrete Water Tower, Chicago.

FOR comparison with British practice we give the following particulars of a water-tower constructed in reinforced concrete for the supply of water at 50 lb. per square inch pressure in the sprinkler system of the Chicago City Railroad Company. The elevated tank has a capacity of 100,000 gallons, and is of cylindrical form with the side wall 8 in. thick. It is 30 ft. in diameter, by 20 ft. deep from the springing of the arched roof to the level where the curved bottom slopes away.

The bottom, which is 8 in. thick, consists of two domes curved in opposite directions, the central part, 19 ft. in diameter, being curved upwards towards the middle, and the outer ring being cone-shaped, with sides at an angle of 45 deg. The outer ring and centre part of the bottom are carried at their junction by a reinforced concrete ring beam, 24 in. wide by 30 in. deep, supported on four reinforced concrete columns, 30 in. square in cross-section,

with extended footings. The total height of the structure from ground level to the top of the tank is 95 ft.

In designing the tower the maximum pressure was taken at 50 lb. per sq. in., causing an estimated pressure of 2 lb. to the base of each column; the gross load being 409,000 lb. The tower is braced by horizontal struts, no diagonal bracing having been adopted.

After the tank was filled with water, perceptible settlement took place. This was for all parts of the work except the aggregate consisting of washed gravel to pass through a 1-in. diameter ring.

Artesian Well is now becoming popular among the proprietors of buildings in the Institution of Civil Engineers' New Institution of Premises.

The well for the supply of water to their new home in Great O. The well has been bored to a depth of 174 ft. commencing at basement floor level below normal ground surface.

After passing through 17 ft. 6 in. of gravel, 118 ft. 6 in. of London clay, and 27 ft. 10 in. of Thanet sand, chalk was met at the depth of 221 ft. 10 in., and the well was sunk for the distance of 174 ft. of the basement floor level below Ordnance level. The well has a capacity of supplying about 2,000 gallons per hour, or more than double the required for the purposes of the well.

The well was sunk by Messrs. J. Sutcliffe, of Bunhill-row, City, E.C.

Reinforced Concrete Reservoirs at East Cotes.

TWO COVERED reservoirs in the East Cotes district Council are approaching completion, designed by Mr. A. Kahn, the Engineer to whom the Kahn system of reservoirs was adopted after careful consideration by contractors being Messrs. W. H. Son.

The reservoirs measure 100 ft. square and clear height of 17 ft. between the floor and roof. The storage capacity of the two is 1,000,000 gallons.

The flooring consists of a 6-in. slab with 3-in. rib bars spaced in two directions at intervals of 14 in. apart. The division between the vertical counterforts is 4 in. to 5 in. thick, reinforced by horizontal vertical bars, and the division wall is thickness and similarly reinforced. The roof is 3 in. thick with 3-in. cup bars in two directions at intervals of 10 in. The roofing includes main and secondary counterforts of the division wall of interior columns.

Colombe Harbour.

THE recently finished breakwater at Colombe Harbour completes the construction of the largest artificial harbours in the world with an area of about 1 square mile and a safe anchorage for from forty to more than 12,000 tons burthen. The stone of the breakwater was laid by the late King Edward VII., when he visited Wales, the harbour at that date being better than an open roadstead, and the full violence of the monsoons. The cost of the works is stated at 3,000,000.

The Woolwich Tunnel.

IN 1907 the London County Council obtained authority to construct a tunnel for the purpose of providing direct vehicular communication between Woolwich and North Woolwich. Those afforded by the existing roads. The new tunnel will be about 1.5 miles long and the estimated cost is 90,000. The design of the tunnel is similar to the tunnel, and it will include stairs to the roadway. It is anticipated that the tunnel will be opened to traffic before the present year.

THE BUILDING TRADE.

THE INSURANCE ACT.

report of the proceedings at the meeting of the National Federation of Building Trades Employers of Great Britain in our issue for last week, raising questions under the Insurance Act answered by Mr. Irons of the Board

arrangements made under sect. 99 with the Board of Trade in respect of workmen engaged through a Labour Exchange or in the employer's time the arrangement is made, workmen engaged independently of the arrangement subsequently to the arrangement in accordance with the explanation which we gave in these pages last. In the same article we also set out the advantages to be derived by adopting the arrangement, and it will be remembered pointed out that greater advantages are available to the workman than to the employer. It is clear that as far as the employer is concerned the adoption of such an arrangement is a gain to the employer except in the case of some trouble, unless during a succession of different workmen was

made to this question because at the point was made as to the danger of Labour Exchanges as the side channels in which labour is engaged during a period in case of trade disputes. Under the workman who has lost employment by a stoppage of work due to a trade dispute the premises at which he is engaged is relieved from receiving unemployed workmen under sect. 87, subsect. 1, but by sect. 86 he is not disentitled to unemployed benefit because he has declined an offer of employment in a situation vacant in consequence of work due to a trade dispute. It is stated that all applicants for work at Labour Exchanges would be informed of the

of a labour dispute. It is clear that if a man is in receipt of benefit he will not risk going to where a dispute is in existence, as he then loses that employment he will forfeit his unemployed benefit under

seems one of the ill-conceived points in the Act as it furnishes men with an incentive to work from as long as their unemployed benefit. The only man who can safely work on premises where a dispute is in existence is the man already employed by a dispute at the premises at which he was last engaged. The above sections apply to men engaged through a Labour Exchange or in other ways, but if the Labour Exchange becomes the sole channel through which labour can be engaged, there does seem to be a combination of being formed, and questions may arise as to the existence of a dispute, especially as the definition of trade disputes is connected with the consent of workmen, "whether in the consent of the employer with whom the dispute arises or not" (see the *Builder*, June 28

legislature in the Insurance Act evidently failed to do something to foster the Labour Exchange, and the workmen engaged through exchanges have considerable advantages to them, whereas the position of employers is somewhat problematic. In our issue of June 14, we said: "It is somewhat surprising that an arrangement which seems to be to the employer alone should be made advantageous to the workman who can on no option, an arrangement which may be disconcerted and even strikes, and the same is introduced in the interest of Labour Exchanges."

that can be said at present is that before employers avail themselves of the section they will carefully weigh the advantages to them and to consider the advantages they accrue from an adoption of the arrangement with Labour Exchanges. It is a pity that the granting of "unem-

ployment insurance" involved a consideration for labour disputes, and that the two questions should be connected one with the other. Under the existing conditions of labour unrest this alone would have seemed a sufficient reason for bringing in unemployment insurance as a separate measure after more mature deliberation.

GOVERNMENT CONTRACTS.

The following tenders have been accepted during the past month by the Government Departments named:—*Admiralty, Works Department*: Quarters for officers and men at Aviation School, Eastchurch—Messrs. F. & H. E. Higgs, Station Works, Hinton-road, Herne-hill, S.E.; removal of roof over No. 2 Dock, H.M. Dockyard, Sheerness—Messrs. M. Lynch & Son, High-street, Rochester. *War Office*: Sanitary appliances (running contract)—Messrs. G. Howson & Sons, Ltd., "East Wood," Hainley, and "Northwood," Berryhill, Stoke-on-Trent; structural steel and iron work for gantry, etc.—Messrs. Whessoe Foundry Company, Darlington. *Works services*: Addition of a roof story and sanitary annexes, and remodelling part of Staff College, Camberley—Mr. J. Crockerell, Stanhope Lines, Aldershot; alterations to Block C, Royal Military College, Sandhurst—Messrs. Turner & Kersley, Blackwater, Hants; artificers' work at Brighton—Messrs. Bostel Brothers, 18, Duke-street, Brighton; artificers' work at Dover—Messrs. G. Lewis & Sons, 14, Wildred-road, Dover; artificers' work at Omagh—Mr. James McGrath, Dublin-road, Omagh; artificers' work at Paul-o-Humber—Mr. E. Weatherley, Villa-place, Newcastle-on-Tyne; artificers' work at Tralee, etc.—Mr. Patrick Murphy, Greenview-terrace, Tralee; asphalt work at Redford Cavalry Barracks, Edinburgh—Messrs. Bradshaw's Asphalt Company, Ltd., 52, Queen Victoria-street, E.C.; brick chimneys, Bordon—Messrs. Martin, Wells, & Co., Ltd., Victoria-road, Aldershot; feltwork at Royal Arsenal and Dockyard, Woolwich—Messrs. Engert & Rolfe, Ltd., Borchester-street, Poplar, E.; new offices, army ordnance department, Fortside, Stirling—Messrs. Watson & Sons, 53, Caledonian-road, Perth; periodical services at: Arbour-hill and Montpellier-hill, Dublin—Messrs. G. Morrow & Sons, Ltd., Clifton-street, Belfast; Bordon, Canterbury, Dover, North Aldershot, Sandhurst, Deepcut, Blackdown, Woking, and Pirbright—Messrs. A. Bagnall & Sons, Ltd., Shipley, Yorks; Colchester—Messrs. E. Fearnley & Sons, St. Jude's-place, Bradford; Tidworth—Mr. D. E. Hudson, Shipley, Yorks; quarters for resident engineer, Curragh—Mr. T. O'Mahony, Sun Mount, Fermoy; remount stables, additions to officers' quarters, and mess block, Alwal Barracks, Tidworth—Messrs. Wakeham Brothers, Friary-yard, Plymouth; remount stables, additions to officers' quarters, alterations to drill shed, band block, etc., additions to mess block, Assaye Barracks, Tidworth—Messrs. G. Grace & Sons, Clatford, Andover; removal of camp buildings, Salisbury Plain—Messrs. W. E. Chivers & Son, Devizes; stables, stores, offices, etc., and additions to officers' quarters and mess block, Mooltan Barracks, Tidworth—Messrs. Wakeham Brothers, Friary-yard, Plymouth; stores, workshops, marker's galleries, firing platforms, etc., Rainham Rifle Range—Messrs. Kirk & Randell, Warren-lane Works, Woolwich; temporary camp buildings, etc., Hereford—Messrs. J. C. Vaughan & Son, 27, Commercial-street, Hereford. *India Office, Store Department*: Concrete mixers—Messrs. Ransome, Ver Mahr Machine Company, Caxton House, Westminster, S.W. *Colonial Agents for the Colonies*: Bridge-work—Messrs. Head, Wrighton & Co., Ltd., 5, Victoria-street, S.W.; The Horseley Company, Ltd., Tipton, Staffs; workshop building—Messrs. Dorman, Long & Co., Ltd., Middlesbrough; cement—the Associated Portland Cement Manufacturers, Ltd., 8, Lloyd's-avenue, E.C.; Clydesdale, roofing—Messrs. McKerron & Co., Ltd., 38, Victoria-street, S.W.; roofwork—Messrs. Braithwaite & Kirk, Crown Bridge Works, West Bromwich; goods sheds—Messrs. J. Lysaght, Ltd., St. Vincent, Ironworks, Bristol. *Office of Works*: Builders' work: Erection of new telephone exchange, Acoorring—Messrs. W. H. Bury & Son, Pleasant-view, Stanhill, Oswaldtwistle; erection of new parcel office, Birmingham (third contract)—Mr. E. Crowder, Farm-street, Birmingham; completion of new post-office, Blyth—Mr. G. Park, Tynemouth road, North Shields; erection of new sorting office, Bow—Mr. H. Hann,

High-street, Collier's Wood, S.W.; extension to sorting office, Brixton—Messrs. Pasterfield & English, 27, High-street, Collier's Wood, S.W.; adaptation of Labour Exchange, Cardiff—Mr. W. A. Linton, Chepstow-road, Newport, Mon; alterations and additions to Chesham Post-office—Mr. J. Mead, 176, Berkhamsted-road, Chesham; Birkenhead and South South End and North South End clearing-houses, at Liverpool Docks—Mr. J. Williams, 70, Collingswood-street, Liverpool; Alexandra and Canada docks and coastwise clearing-house at Liverpool Docks—Mr. G. L. Desoer, Everton-road, Liverpool; erection of post-office, Newcastle-under-Lyne—Messrs. J. Meiklejohn & Son, Edward-street, Stoke-on-Trent; Portsmouth ordinary works—The Portsmouth Water Fittings Company, Ltd., Hyde Park-road, Southsea; enlargement of Stockport Post-office—Messrs. W. Bowers & Co., Bath-street, Hereford; engineering labour in day-work at: Birmingham—Messrs. Walker Brothers, Upper Priory, Birmingham; Liverpool—Messrs. Pulford Brothers, Ltd., 108-110, Whitechapel, Liverpool; Manchester—Messrs. Saunders & Taylor, Ltd., 43, Lower Mosley-street, Manchester; tarp-paving at Liverpool Docks Clearing Houses—Messrs. Constable, Hart, & Co., Ltd., Clarence House, Albert-street West, E.C.; temporary building of Goole Labour Exchange—Mr. W. Harbrow, Iron Building Works, South Bermondsey, S.E.; pay and voucher boxes, Birkenhead clearing-house, North South End clearing-house (staircases, etc.), at Liverpool Docks—Mr. G. P. Banbury, East Surrey Ironworks, Croydon. *General Post Office*: Buildings, etc.—Messrs. Caldwell & Perkins, Penzance; laying lines of pipes along Lambeth-road, Wandsworth-road, and St. John's-hill—Messrs. Grounds & Newton, Faze-green, South Tottenham, N.; laying lines of pipes in Portsmouth—Messrs. Greig & Mathews, 35, Queen Victoria-street, E.C. *Metropolitan Police*: Carrying out alterations at Chiswick Police Station—Messrs. Messom & Sons, Grosvenor-road Works, Twickenham; carrying out alterations at Enfield Town Police Station—Mr. A. Monk, Lower Edmonton; carrying out alterations at Kennington-lane Police Station—Messrs. Prestige & Co., Cambridge Wharf, Grosvenor-road, S.W.; erection of new police station and court-house, at Hampstead—Messrs. Moss & Sons, The Meadoway, Hendon, N.W. *Commissioners of Public Works, Ireland*: Building works: Erecting and furnishing Ballymichael National School, Co. Donegal—Messrs. McMullan Brothers, Kilaroe, Co. Donegal; alterations to Royal Hibernian Military School, Phoenix Park, Dublin—Messrs. Colten Brothers, Ltd., East Wall, Dublin.

A TRADE CONVENTION.

MESSRS. ROBT. INGHAM CLARK & Co., LTD., varnish and enamel manufacturers, held their annual Convention of Representatives on July 30 and 31 and August 1, there being present the principals and delegates from the firm's allied houses and branches in America, Canada, Australia, India, France, Germany, Belgium, Holland, Italy, Spain, and Portugal.

In opening the Convention at the offices of the company in Caxton House, Westminster, the Chairman, Mr. F. W. Clark, extended a welcome to all present, and Mr. W. H. Andrews, President of Messrs. Pratt & Lambert (Incorporated), of America, delivered an address, in which he referred to the development of the business in that country in recent years. The Chairman then declared the Convention formally opened, and the rest of the day was devoted to a general discussion.—On the following day the Convention reassembled at West Ham Abbey, where the works of the company were inspected, as well as the different processes of manufacture of the "Britannia" brand of varnishes. Practical demonstrations were given by the works manager and his assistants of the uses, methods of application, and results obtained with certain specialities and products of the firm. An interesting item in the visit was the inspection of the new exhibition hall recently completed, to serve as a permanent exhibition of coach and decorative work on which the manufacturers of the company are employed from start to finish. Leaving the works about 5 p.m., the members of the Convention returned to the Westminster Palace Hotel, where they were entertained to dinner.

On August 1 the Convention assembled at Caxton House, when a final discussion took

place upon the work done during the two previous days. The proceedings terminated at midday, when the party left by train for Richmond and went on board the steam launch *The King*, in which a trip was made up the river, luncheon and tea being served on board. Returning in the evening to Hampton Court, a short time was spent in visiting the gardens of the Palace, and the party then proceeded to Tagg's Thames Hotel, where a banquet, presided over by the Chairman, brought the Convention to a close.

GENERAL BUILDING NEWS.

TOWER, LEEING CHURCH, NEAR BEDALE.

On the 26th ult. the Bishop of Ripon dedicated a new tower to Leeming Church, near Bedale, Yorks. The tower is built of local bricks with traceried windows of stone and with stone pinnacles and battlements. It is 12 ft. square, and about 48 ft. high, and has a peal of eight tubular bells by Messrs. Harrington & Latham, of Coventry. The carving was executed by Messrs. Martyn, of Cheltenham. The sole contractors were Messrs. T. & J. Willoughby, of Northallerton. The architect was Mr. H. D. Fritchett, Lic.R.I.B.A., of Darlington, the total cost, without bells, being about 505*l*.

SCHOOL EXTENSION, BOLTON.

A new primary department in connexion with the Primitive Methodist Church, Higher Bridge-street, has just been opened. Messrs. Stead & Morris, of Bolton, were the architects. The plans included the erection of a new two-story building at the rear of the present school, and the provision for a new primary school on the ground floor, new vestry above, new kitchen, cloakroom, and ladies' and gentlemen's conveniences. The contract work was let to Messrs. Page & Sons, builders and contractors, who, together with the sub-contractors, Messrs. Moore Brothers, bricklayers, Tongue Moor, with Mr. S. Clarke as clerk of the works, have carried out the work.

CHURCH HALL, BRIMINGTON.

Mr. W. M. Ashmore, of Chesterfield, is the architect for this new building, which is being erected at a cost of about 1,300*l*. The hall is 85 ft. in length and will seat 350 people. The builder is Mr. W. H. Margeson.

NEW PAVILION AT TORQUAY.

The new pavilion was opened on Saturday last week by the Mayor. The building has been erected at the eastern end of Princess-gardens, which were laid out on land reclaimed from the sea nearly twenty years ago. As the site is mainly of sand special provision had to be made for the foundations of the building, and the scheme of a reinforced concrete raft was adopted. Upon this a steel framework was erected, the spaces between the stanchions being filled with brickwork faced with imitation marble. The roof of steel lattice-work is covered with felt and copper. That portion of it which faces Princess-gardens and the harbour is flat, with an external covering of asphalt, and will be used as an open-air promenade and tea-garden. The total cost of the building was 17,000*l*. Mr. Henry R. Garrett, the Borough Engineer, was the architect.

TELEPHONE EXCHANGE, DARLINGTON.

A new telephone extension is being made to the existing Post Office buildings. On the lower ground-floor level, or the Crown-street entrance, there will be a test-room 42 ft. by 29 ft., heating chamber, basket store, lift, motor-room, and engineers' stores, etc. On the principal floor the existing sorting office will be extended to a length of about 85 ft., with postal stores, and women's retiring-room, lavatories, and cloak-room adjoining. On the upper floor there will be a telephone switch-room, 36 ft. by 30 ft., and spare rooms. The contractor is Mr. W. B. Cooper, of Darlington. The work will be carried out under the general supervision of Sir Henry Tanner, I.S.O., F.R.I.B.A.

RENOVATION OF THE SHIRE HALL, CHELMSFORD.

The renovation of the front of the Shire Hall, Chelmsford, is now practically complete. Messrs. Henry Potter & Sons, of Chelmsford, erected the scaffold; and Messrs. Cubitt & Co., of Gray's Inn-road, carried out the renovation work. The entire renovation has been accomplished under the direction of the County Architect, Mr. Frank Whitmore, while Mr. F. A. Browne, of the County Architect's office, has supervised the work on the building.

BOARD-ROOM, TOXTETH.

A new Board-room has been erected for the Toxteth Guardians from plans prepared by Mr. W. W. Thomas, architect. This Board-room is the last of many improvements which have been made to the public offices, which were erected in 1865.

THE CITY HALL, GLASGOW.

This hall has now been redecorated under the supervision of Mr. John Ednie, Art Superintendent at the Royal Technical College, and the general scheme of decoration is cream, gold, and blue, all the woodwork being painted mahogany. The work was executed by Messrs. J. B. Bennett & Sons, Ltd., of Glasgow.

THE NEW LAW COURTS.

The structure that has slowly arisen on the "Strand Park"—as the strip of garden land alongside the old Law Courts has been called—is now practically complete, after over three years' work. There are four additional courts—two Divorce Courts, the Court of Criminal Appeal, and the Court of the Railway and Canal Commission. It may be mentioned, says the *Morning Post*, that the late George Edmund Street, the architect of the parent buildings, intended to cover this ground with the great Record Tower, surrounded by subsidiary offices, but was hampered by the conflicting interests of the Law Officers and the then Minister of Works. Had Mr. Street had his way, a more adequate provision for expanding accommodation would have been made, and his original scheme of placing the courts around the great hall was, unfortunately, never realised. The new buildings, which have cost approximately 100,000*l*, to complete, were designed by Sir Henry Tanner, Architect to the Office of Works, and the spirit of Street's work has been carefully and sympathetically followed. To the Strand the frontage presents a gable, crocketed and surmounted by a statue of Justice, the work of Mr. Stevenson, of Chelsea. At each end of this elevation there is a turret, to match the original building. A bridge, consisting of three arches, connects the four new courts with the court level of the old building, and spans the old steps that form an approach to Carey-street. Entering from the Strand, the Divorce Court Judges have an electric lift to their rooms. In the old court about 500 persons in all could crowd in to the hearing of the case; now nearly 600 will be accommodated in the new court. Under the Court of Criminal Appeal there are nineteen cells, about 4 ft. square, and from an adjoining corridor there is a staircase direct to the dock. An illustration of the additions appeared in our issue for July 11, 1903.

HOSPITAL, POWEY.

The foundation-stone has just been laid of a new hospital at Powey, on the Place estate. The building will be roofed with Delabole slate. There are to be three wards—a four-bed male ward, a two-bed female ward, and a private ward—a committee-room, sitting-room, and an operating theatre. A verandah is to run the whole length of the south front, and corridors will traverse the building in direct line right through. The building is estimated to cost 2,000*l*. The architect is Mr. Parkes Lees, of Lanteglos-by-Powey.

TRADE NEWS.

Messrs. W. H. Willcox & Co., Ltd., Government contractors, oil refiners, leather belting manufacturers, etc., have, through expansion of business, found it necessary to acquire increased accommodation, and have taken a building adjoining their main warehouses, Nos. 32, 34, and 36, Southwark-street, viz., No. 38, and are removing there on August 27. The registered offices will in future be at No. 38.

Alterations are being carried out at No. 89, Commercial-street, E., by Messrs. E. A. Rooome & Co., 36, Baringhall-street, under the superintendence of Messrs. Still, Wheat, & Luker.

CASTLE CARROCK SEWERAGE.

The Brampton Rural District Council have instructed Messrs. Taylor & Wallin (Mr. Harry W. Taylor, A.M.Inst.C.E.), of New-castle-on-Tyne and Birmingham, to prepare a scheme of sewerage and sewage disposal for the village of Castle Carrock.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

The following applications have been dealt with during the recess of the London County Council:

Lines of Frontage and Projections.

Camberwell, North.—Projecting sign at the Grand Hall, Camberwell New-road. Camberwell (Messrs. F. Matcham & Co. for Mr. F. W. Purcell).—Consent.

Camberwell, North.—Projecting illuminated sign in front of No. 13, Church-street, Camberwell (Mr. C. G. Macdowell for the Prosser Roberts Company).—Refused.

Chelsea.—Projecting sign at the garage of Messrs. Harrods, Ltd., on the eastern side of Sloane-avenue, Ch. C. W. Stephens for Messrs. Harrods. Refused.

City of London.—Balcony in front of Fleet-street, City (Messrs. Murray Murray for Messrs. Sweetings, Ltd.).—Refused.

Dulwich.—Retention of a greenhouse, erection of a greenhouse at No. 267, road, Dulwich, next to Upland W. M. Epps for Miss Emily Rue).—

Fulham.—Bay-window at No. 120, ham-road, Fulham, as a shop front for Mrs. Trood).—Refused.

Holborn.—Erection of an illuminated British Museum tube railway station. Holborn (Mr. E. P. Grove for the London Railway Company).—Consent.

Holborn.—Erection of Nos. 24, 26, Great Queen-street, Kingsway (Messrs. Walters for Messrs. Johnson, Dymott).—Consent.

Kensington, North.—Erection of a teak staircase at No. 1, Royal-crescent, Notting Hill (Mr. W. W. Willett for Mr. E. W. W.).—Consent.

Kensington, North.—Erection of windows, at No. 14, Ladbrooke-road, ton (Mr. W. Willett for Mr. E. W. W.).—Consent.

Kensington, South.—Iron and glass No. 1, First-crescent, Kensington).—Consent.

Kensington, South.—Erection of Oxford-gardens (Mr. A. Ramsden).—Consent.

Kensington, South.—Erection of a High-street, Kensington (Mr. W. L. Messrs. W. H. Hunt & Co., Lewis & J. Burt & Son, Lilley & Skinner).—Consent.

Kensington, South.—Projecting sign "Friend at Hand" public-house of Kensington (Messrs. F. Sage & Co., Messrs. Harrods, Ltd.).—Consent.

Lewisham.—Erection of five houses, windows projecting houses on the side of Brookley-grove, Lewisham (J. W. Heath & Sons).—Consent.

Lewisham.—Erection of buildings, windows on the western side of Brookley-grove, Lewisham (J. W. Heath & Sons).—Consent.

St. Pancras.—Erection of a closet and staircase in the front of 24, Guilford-street, Russell-square (Mr. Yeo).—Consent.

Strand.—Two showcases at No. 27, bury-avenue (Messrs. E. Pollard & Mr. H. Goodman).—Consent.

Strand.—Two showcases at No. 1, bourne-street, Piccadilly (Mr. W. W. for Mrs. H. Levey).—Refused.

Wandsworth.—Porches, bay-windows, and balconies to fourteen houses on the side of Kirtall-road, Streatham (A. G. Hashtlow for Mr. F. E. Cain).—Consent.

Wandsworth.—Bay-windows, porches, oriel windows to four houses on the western side of Tooting Bec-road, Wandsworth of Montana-road (Messrs. Selby).—Consent.

Wandsworth.—Addition to a one-story at No. 99, Streatham High-road, Shrubby-road (Boat's Pure Drug Co. Ltd.).—Consent.

Width of Way.

Kensington, South.—Addition at the "Macaulay Arms," Church-street hill, abutting upon Peel-street (Mr. Messrs. Whitbread & Co., Ltd.).—Consent.

Width of Way and Space at R Poplar.—Erection of four cottages southern side of Morant-street, Poplar (T. J. Bee for Mr. W. J. Kemp).—Consent.

Width of Way, Line of Frontage, and Space at R.—Erection of a one-story at the rear of a house, site abutting upon Oxford-street, street, Castle-street East, Adam and Wells-street, St. Marylebone (Boehmer & Gibbs for Mrs. M. Clark).—Consent.

Lines of Frontage and Construction.—Erection of a showcase at Half Moon-lane, Dulwich, next to road (Mr. T. Baughan).—Refused.

Islington, East.—Temporary show front of No. 51, Mildmay-park (Messrs. Lovegrove & Papworth).—Consent.

Space at Rear and Projection.—Building upon the site on 42, Bedford-street and No. 25, line, Strand, with an irregular opening the rear and with a three-story oriel next to Bedford-street (Messrs. C. Sons for the Corps of Commissaries).—Consent.

Alteration of Building.
 Additional story to an existing at the rear of No. 106, Goldhurst-
 street (Mr. A. S. R. Ley for
 Burnham Hamman).—Consent.

Space at Rear.
 Erection of a headmistress's
 school at St. Paul's School for
 Green and Rowan-road, Hammer-
 (Dandy Watney).—Consent.

Erection of a building upon the
 57 and 59, Clifton-street, Hoxton,
 regular open space at the rear (Mr.
 for Messrs. J. Willmott & Sons).—

South.—Erection of an addi-
 at No. 1, Astwood-mews, South
 (Mr. A. W. Rose).—Consent.

East.—Erection of a building
 of Nos. 107 and 108, High-street,
 (Mr. J. R. Vining).—Consent.

Hanover-square.—Alterations to
 building attached to No. 38, Hill-
 (Mr. W. Flockhart for Mr.
 (Mr. J. R. Vining).—Consent.

Hanover-square.—Erection of two
 on the site of Nos. 8, 9, and 10,
 St. George, Hanover-square
 (Foster).—Refused.

Hanover-square.—Alterations and
 the premises of Krieger Electric
 Ltd., No. 48, Gillingham-
 street-square (Mr. G. S. F. Ratty
 for Krieger Electric Carriage Syndicate,
 Ltd.).—Consent.

North.—Erection of buildings on the
 site of Streatham High-road, Wand-
 sworth, Herne-hill-bridge (Messrs.
 Sheffield).—Consent.

North.—Erection of two buildings at
 the corner of Salterford-road and Welham-
 street, with irregular open spaces
 (Messrs. Swain & Selley).—Consent.

Formation of Street.
 Formation or laying-out of a
 carriage traffic to lead from Taylor's
 Salterford-road, Lewisham (Mr. E. B.
 (Mr. E. B. Selley).—Refused.

for the Supply of Electricity.
 Construction of additions to
 electricity generating-station, Yeovil
 (Mr. H. Heckford for the Poplar
 Borough Council).—Consent.

West.—Coal-conveyor staging at
 generating-station, Southwark (Mr.
 for the City of London Electric
 Supply Company, Ltd.).—Consent.

Alteration of Building.
 Additional story upon part
 of House, Old Broad-street, City
 of London (Messrs. H. G. & Son for the
 City Offices Company, Ltd.).—

Cubical Extent.
 Erection of a building and silos
 for the storage of the Morgan Crucible
 Company, Battersea (Morgan Crucible
 Co., Ltd.).—Consent.

Erection of two additions at the
 rear of the General Motor Cab Company,
 10, Cranmer-road, Kennington (the
 General Motor Cab Company, Ltd.).—Consent.

London.—Retention of an iron build-
 ing at the rear of the premises, Salisbury
 street, Lion court, Crown-court, and
 Fleet-street, City
 of London (Lloyd, Ltd.).—Consent.

Uniting of Buildings.
 Use of rolling steel shutters to
 form a division wall at the premises of
 a Tyre Company, Ltd., Fulham,
 between the main building and the ex-
 tension to openings between the new floors
 and the extension next to the
 (Milner Safe Company, Ltd., for
 a Tyre Company, Ltd.).—Consent.

London.—Uniting of No. 20, White-
 City, with a building at the rear,
 and an opening at the second-floor
 level (Walter Hall & Sons).—Conse-

Central.—Opening between Nos. 8
 and 10, Green and No. 56, St.
 E. Finsbury, and to the use of
 the space (Mr. J. B. Gridley for
 Pollard & Co.).—Consent.

Uniting of Nos. 17 and 18 and 19
 ulam-street, Holborn, by means of
 at the third-floor level (Mr. M. W.
 Messrs. J. Willmott & Sons).—

Uniting of Nos. 37 and 38, Be-
 olborn (Messrs. Robinson & Roods
 Torr & Co.).—Consent.

South.—Iron and glass roof over
 the passageway, at present un-
 der the Kenington High-
 road, between the Metropolitan District
 and the premises of Messrs.

Pontings, Ltd. (Messrs. Pontings, Ltd.).—

Refused.
 Linthouse.—Uniting of the Phoenix Biscuit
 Works, Medland-street, Lighthouse, with No.
 18, Narrow-street (Mr. E. A. E. Woodrow).—

Consent.
 Rotherhithe.—Formation of two openings in
 the party-wall between Nos. 106 and 108,
 Jamaica-road, Rotherhithe (Mr. A. W.).—

Consent.
 St. Pancras, East.—Use of double rolling
 shutters in lieu of double iron doors to an
 opening in a division wall at a motor garage,
 Rochester-mews, Camden Town (Milner's Safe
 Company, Ltd.).—Consent.

Strand.—Formation of openings at the base-
 ment and ground floor level, between No. 32
 and Nos. 33 and 34, Warwick-street, Regent-
 street (Mr. J. R. Vining for Messrs. Liberty &
 Co.).—Consent.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ASHFORD.—Council buildings; Mr. W. T.
 Woodbridge, Surveyor, Rural District Council
 Offices, Epsom.

Aspull (Lancs).—Convenience at the Finger
 Post and near St. Elizabeth's Church; Mr.
 L. Athron, Surveyor, Urban District Council
 Offices, Aspull.

Barrow-in-Furness.—Extensions at Electricity
 Works (1913); Messrs. W. Gradwell & Co.,
 Ltd., builders, Hindwood-road, Barrow.
Birkenhead.—School near Birkenhead; Mr.
 W. D. Wiles, County Architect, 42A, High-
 street, Wrexham.

Birmingham.—Additions to women's hospital
 (4,500); Mr. F. W. Martin, architect,
 Colmore-row, Birmingham.
Bognor.—Thirteen houses, Sheepwash-lane
 (2,660); Messrs. H. W. Newell & Son,
 London-road, Bognor.

Bournemouth.—Additions to school; Mr. T.
 Stevens, architect, Richmond-chambers.
Bournemouth.—Messrs. McWilliam & Son,
 builders, Wharf-road, Bournemouth. Addi-
 tions to Meyrick Park Hotel; Mr. A. G.
 Ware, architect, Observer-buildings, Albert-
 road, Bournemouth.

Carlisle.—Store at harbour; Mr. W.
 Hardy, Engineer, Carlisle Lough Commis-
 sion.

Chard.—Additions, Municipal buildings
 (2,000); Mr. S. G. Rogers, Surveyor, Town
 Hall, Chard.

Chesham.—Swimming-bath (465); Messrs.
 Rust & Ratcliffe, builders, 1, Higham-road,
 Cork.—Residence for Medical Superintendent
 (1,355); Mr. J. Buckley, builder, Cork.
Crook (Co. Durham).—School; Mr. John G.
 Burrell, architect, Market-place-chambers,
 Durham; Messrs. Morton Brothers, builders,
 Crook.

Dartford.—Public hall (3,000), and library
 (5,000); Mr. W. Kay, Clerk, Urban District
 Council Offices, Dartford; Architect to be
 appointed by competition.

 street; Mr. T. H. Johnson, architect, Priory-
 place, Doncaster; Messrs. B. Wortley & Son,
 builders, 18, Nether Hall-road, Doncaster.

Durham.—Workmen's dwellings (1,025).
 Messrs. Beevers & Clark, builders, Church-
 street, Durham.

Eastry.—Four houses (800); Mr. D. E.
 Foster, Surveyor, Rural District Council
 Offices, Eastry.

Eccleston.—Extensions to mill for the Eccles-
 ton New Mill Company, Ltd., cotton goods
 manufacturers.

Edinburgh.—Extensions to Ladies' College
 (20,000); Mr. J. Hippolyte Blanc, 20, Rut-
 land-square, Edinburgh.

Elland.—Proposed workmen's dwellings;
 Mr. P. H. Whitlam, Surveyor, Urban District
 Council Offices, Elland.

Exeter.—Lloyd's Bank; Mr. J. A. Lucas,
 architect, High-street, Exeter; Messrs. West-
 cott, Austin, & White, builders, Summerland-
 crescent, Exeter.

Eve (Oxon).—School (2,300); Mr. S.
 Stedall, architect, 8, New-road, Oxford.

Flushing.—Proposed twelve houses;
 Mr. J. H. Chubb, Surveyor, Rural District Council
 Offices, East Kerrier.

Foleshill (Coventry).—Additions to Windmill
 Land School; Mr. J. Willmott, architect, 6,
 Waterloo-street, Birmingham.

Glasgow.—Electric theatre, Paisley-road,
 Toll (2,000); Mr. A. V. Gardner, architect,
 104, Bath-street, Glasgow. Additions to Peter-
 hill School (4,000), also to Eastpark School;
 Mr. J. Maben, architect, 129, Bath-street,
 Glasgow. Warehouse and offices, Mitchell-
 street (10,000); Messrs. Frank Barnett &
 Boston, architects, 180, Hone-street, Glasgow.
Hospital for consumptives (60,000); Mr. A. B.
 McDonald, Surveyor, Burgh Hall, Glasgow.

* See also our list of Competitions, Contracts,
 etc., on another page.

Great Yarmouth.—Additions to infirmary
 (5,000); Mr. A. S. Hewitt, architect, Regent-
 street, Great Yarmouth.

Gullane.—House (1,340); Mr. W. Cuth-
 bert, builder, Aberlady.

High Dalmaur.—Sixty houses; Mr. Leslie
 Kirk, builder, Clydebank.

Hingham (Attleborough).—Six houses
 (1,054); Mr. H. G. Tofts, builder, Hingham.

LONDON COUNCILS.

Barnes.—Application is to be made to the
 London and South-Western Railway Company
 to ascertain whether they would consent to a
 scheme prepared by the Borough Surveyor for
 carrying out the widening of Barnes Railway
 Bridge. This scheme provides for the widen-
 ing of the approaches of the bridge out to
 45 ft., so as to give two 7-ft. 6-in. footways
 and a 30-ft. carriageway on the approaches,
 and a 26-ft. carriageway and a 6-ft. footway on
 the bridge itself; also for carrying the foot-
 path on the west side of the line so as to
 meet the company's footbridge. The estimate
 cost of the work is put at 2,100. In order that
 Barnes High-street may be widened
 application is to be made to the Local Govern-
 ment Board for a Provisional Order to enable
 the Council to put into force the compulsory
 powers of the Surveyor have been approved
 for making up St. Leonard's-road. Subject to
 a contract, the Roadmaking Company, Ltd., are
 to be asked to provide and lay on the road-
 way in a portion of the Rock's-lane, "Road-
 mare" at least 1 in. thick, upon a prepared
 macadam foundation, at 5s. 8d. per yard
 super, and maintain same for a period of five
 years. Plans have been passed for Messrs.
 Adamson & Sons for carrying out additions to
 Hinxton House, Stonehill-road.

Hemel Hempstead.—The Surveyor has been
 instructed to prepare an estimate for carrying
 out an improvement scheme on the west side
 of High-street. Plans have been passed for
 Mr. S. C. Smith for five pairs of houses in
 Chapel-street; also for Mr. I. Lea for exten-
 sions to the Electric Theatre, Albion-hill.

Paddington.—Dr. Reginald Duffield, Medi-
 cal Officer of Health for the Borough, in his
 annual Report which has just been issued,
 states, with regard to drainage work, that the
 drainage system of 227 houses were wholly or
 partially reconstructed during the year, as
 compared with 257 in 1910, 554 in 1909, and
 605 in 1908. In addition, the drains of fifty
 houses were made water-tight by means of the
 patent process. The drains of sixty-four other
 houses were tested for various reasons, and
 found to be sound. In 1909 ninety-seven
 drains were found on first test to be water-
 tight. The reconstruction of the combined
 drainage systems on the Queen's Park Estate
 commenced in 1900, has now been completed.
 In the course of the work certain short lengths
 of combined drains (main drains close to the
 sewer connections) were found to be under
 large masses of concrete. Such short lengths
 were not disturbed, but the right to require
 their reconstruction, if found later to be
 necessary, was insisted on. During the past
 year rats were found to have made their way
 from certain of these old drains, which were
 then reconstructed. Unused house connexions
 were found on the main drains. At eight
 houses settlements in the back additions made
 underpinning necessary, such work involving
 disturbances and partial reconstruction of the
 drains. At fourteen houses damp-proof courses
 were put in the main walls to remedy damp-
 ness. Thirty-three houses were inspected after
 the occurrence of infectious disease, and the
 drains chemically tested after cases of
 diphtheria and enteric fever. All drains so
 tested were found to be sound. With regard
 to deposit of drainage plans, the Medical
 Officer states that last year 348 sets of plans
 and notices were received, as compared with
 303 in the previous year. With regard to
 combined drainage, four systems examined last
 year were found to be defective and were
 reconstructed by the Council. The total
 number of premises inspected for the purpose
 of the Housing, Town Planning, etc., Act, 1909,
 was 154, and in the majority of instances the
 conditions found were remediable under the
 Public Health (London), Act, 1891. The
 necessary notices were served, and the required
 works carried out. Ten years have elapsed
 since the presentation of the Special Report
 (August, 1901) on the housing conditions, etc.,
 in the Clarendon-street area. It is proposed to
 submit in the early autumn a further Report
 contrasting the conditions found at the
 enumeration of 1911 with those noted in 1901.
 The proposed Report will also give compara-
 tive vital statistics for the periods 1896-1901
 and 1905-11.

THE ROYAL SANITARY INSTITUTE: CONGRESS AT YORK.

(Concluded from last week, page 199.)

Delhi.

Mr. T. SALKFIELD (Engineer to the Delhi Municipality) contributed a paper on "Delhi," which in his absence was taken as read. He traced the past history of the city, which goes back as far as the XVth century B.C., and described the present sanitary system and waterworks and other branches of municipal enterprise. In conclusion he said:—"Delhi is again to take her stand as an Imperial city, and Phoenix-like from the ashes and ruins of past cities the piles are to rise which are to hold the Viceroy of our Sovereign, and the councillors and machinery by which the great continent of India, with its millions of inhabitants, is governed. The task of the town-planners of the Imperial capital would appear to be to these not only a city which will set the high-water mark for India for the tide of municipal perfection and sanitation, but one which in stately beauty will also outlive both the massive magnificence of the Moghul palaces in the Fort."

The Chairman, in proposing a vote of thanks to the authors of papers read, said that the subjects discussed had been interesting to architects, civil engineers, and sanitary engineers. The suggestions of Mr. Ricardo so far as the by-laws of the Local Government Board were concerned might give offence to some, but if they looked through some of the by-laws in the rural districts they would find that architects were tied down in the building of cottage property in such a way that it made it almost impossible for them to build cheap houses. It was, in his opinion, necessary to give at least a tenth of an acre of garden to a cottage, but when they were laying out an estate they had to make roads 36 ft. wide, and that was wrong. The city of Newcastle-on-Tyne had some of the most stringent by-laws he knew of, and would not allow a party wall to be less than 14 in. or a drain less than 9 ft. deep to be started. Representations, however, had been made by the architects to the authorities, and they now allowed the drains to start at 4 ft. 6 in. instead of 9 ft. With regard to the means of escape in case of fire, the iron staircases were generally placed outside the windows, with the result that if a fire occurred on one of the lower floors the flames got through the window, and the people above were cut off from the staircase.

Mr. G. Benson, A.R.I.B.A., seconded the motion, and it was carried.

At the second sitting of the Conference Mr. W. H. Humphreys took the chair.

York Fifty Years Hence.

Dr. Tempest Anderson, in an address on this subject, illustrated by lantern slides, suggested a scheme of a circular road at the outskirts of the area of the city at present built upon, and the keeping in view of probabilities of another farther out for future developments. He showed his suggestion on the screen, but confessed that he was not an architect or a surveyor, and recognised that the details required working in by a master hand.

Mr. Spurr (City Engineer, York) said that some progress had been made in town planning in York, and a serious attempt was being made to develop the outskirts on town-planning lines. The first area was almost completed, and the meeting of owners and occupiers would be held early next month.

Miss E. A. Lowe (Warrington), referring to the complaint of Dr. Anderson that certain districts which should have been acquired years ago for new routes had been built over by working-class dwellings, asked where they were to live. She suggested that they should be housed in model villages.

Dr. Anderson said he was connected with a land company formed to provide small, commodious houses for the working classes, and the first difficulty they met with was that of sewage, which absorbed a good deal of their capital. They were going to form wide streets with grass verges, and the local authority asked who was going to keep them in order. In the end they had to borrow money from an insurance company. Owing

to a number of the railway workmen being removed to Darlington, the houses did not go off as was expected, and the result was that the mortgagees foreclosed and the shareholders lost every penny they had put into the company. He had a few plots left on his hands, and he had now got a notice from Mr. Lloyd George for extra tax for undeveloped land. If the Corporation of York would offer a prize or a series of prizes for the best plan which would include the ring road and all the other amenities they had been talking of, he would be pleased to contribute 100l. towards such a desirable end.

Dr. Armstrong considered that the duty of the local authorities was to provide for the very worst of the slum dwellings.

Mr. Brodie (Blackpool) observed that they had in one scheme for road widening bought more land than they wanted, and, having made the necessary improvements, they had sold the surplus land at a price which recouped them for the expenditure.

Purification of Water.

Dr. Myer Coplans (Leeds), in the course of a paper on "Some Points in the Purification of Water," suggested that means for the detection of the presence of sewage in water must become rather more dependable and serviceable than has been the case hitherto, and it was possible that a wider use of the salinometer, or some such similar apparatus, for the detection and elimination of electrolytes in solution might be the means of the speedy recognition and the still more speedy localisation of faults occurring in the course of our water supplies.

Sewage Works for Institutions, etc.

Dr. H. Maclean Wilson (West Riding Rivers Board) discussed the question of sewage works for institutions, country houses, and small hamlets. The author admitted that there was nothing new in the methods adopted, and were those of Professor Dunbar, Director of the Hamburg Hygienic Institute. He described what works would be required for the domestic sewage of a small hamlet containing 100 persons.

Mr. J. E. Tulse also contributed a paper on "Country House Sewage Purification." He said that the first decade of the XXth century probably witnessed the greatest realisation of the need for dealing with the question of sewage treatment for the larger towns and cities, and for carrying out works to meet satisfactorily, as far as available knowledge permitted, these requirements. During this period the necessary purification of the sewage from the large towns had been fairly adequately completed. The sewage problem of the second and third decades of this century would probably be, first, the bringing into line of the towns and villages, and second, the realisation of the necessity for extending the work to the smaller hamlets and groups of houses and isolated buildings. In many parts of the country these were still in a lamentable condition as regards both water supply and drainage. The absence of regular attendants and the impracticability of installing sludge lifting and pressing plant for a small installation rendered it necessary to try to devise some alternative method. He believed that the hydrolytic tank of Dr. Travis in England, the Enscher or Dortmund tanks in Germany, and the modification of these as designed by Mr. Aird Murray in Canada at the Lethbridge works point the way in which this modification should be sought, for in such a tank the liquid sewage, which constituted, he supposed, roughly 95 per cent. of the total volume, could be treated in an aseptic condition, while septic action may be utilised for its sole useful function of breaking down and digesting the solid portions, so as to render them more capable of being attacked in the filter bed or removed from the tank.

Mr. Kaye Parry said he had been associated with the question of sewage purification for a great many years, and he thought the younger men there would perhaps learn something by looking back and seeing how the question was handled by the early reformers. They believed that sewage purification could be accomplished in a country house without putrefaction, because the sewage came down within three or four minutes from the time it got into the drains. Mr. Rogers Field used simply to screen out the solid matter, and allowed the liquor to

flow over the land where it was used. Mr. Bailey Denton put it through of intermittent filtration, which, bacteriological process, although he knew it at the time. He was the solution of the problem, so the houses and isolated institutions concerned, was to deal with the liquid as fresh.

Dr. Temple Anderson supported the last speaker.

Mr. Costain (Great Crosby) said large country house, or even a smaller house, he considered as of the septic tank principle superior to the system described by Parry.

Mr. Burleigh said that as an architect he felt the local Councils were making mistakes in insisting on water country districts and having works which cost a great deal of money. He said that in Holland the water-closets, and the Dutch weakly class of people. On the other hand, they were an energetic class of people who grew more than they required a septic tank. They did this because they were of natural conditions, and sewage as manure on the land, and the country threw it into the sea. Mr. Fairbank said that with a designed sedimentation tank of large size, and with even and distribution, there should be no need for small installations.

Sanitary Fittings.

Mr. Saxon Snell, F.R.I.B.A., in a paper read by the General Council for the Registration of Plumbers on "Sanitary Fittings, Arrangement, and Fixing," which stated that it was the duty of the principles and construction of sanitary fittings should be under the control of the authorities, and they could be satisfactorily arranged for the positions for which they were intended. If all sanitary fittings were so constructed that any part likely to act foul or become a nuisance was easily accessible for cleansing and that objectionable features would be avoided. As water-closets were by far the most important class of sanitary fittings, they should be taken to select from the available those most suitable for the positions in which they were required. There could be no doubt that for the chamber floors those apparatuses which were as nearly noiseless as possible and which required a large amount of water in the bowl, the improved valve water-closet, the working siphonic, were the most suitable. When enclosures to the water-closet were desired or found most convenient, improvements should be adopted which would avoid the objections justly raised against the old style of enclosed seat. Enclosed seats in connexion with a water-closet should be non-absorbent as practicable. All sanitary fittings were often used against the wall, and the second siphonic water-closet and the third valve-closet were wise precautions to prevent the passage of drain air into the room when these traps were self-clearing. A little, if any, disadvantage could be overcome by their use. The single-seal water-closet, as the wash-down pedestal and the very suitable for water-closets in small positions, but many pedestal water-closets, owing to their simplicity, were often used to lose the water seal of the trap of the valve and siphonic type. It was important, therefore, to guard against the effect of momentum, siphonage, and evaporation. No ordinary trap could be relied upon against the effect of siphonage, and such action was likely to occur when the water flush was most essential. The supply of water-closets, and while the supply was most satisfactory, it was necessarily wasteful; indeed, the absence of a waste-preventer induced less waste of water. The connection between earthenware water-closets and soil-pipes should be made by means of metal ferrule or socket soldered on the pipe, and the joint made with some equally reliable cement. It was a duty to cleanliness the corbel

PATENTS—continued on page 244.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk advertised in this number:** Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xv.; Auctions, xv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertiser binds themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those who submit tenders, may be sent in.

* * It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

AUGUST 30. — SAXON SNELL PRIZE.—Fifty guineas, with medal, is offered for essay on "The Lighting, Heating, etc., of an Operating-Room for a General Hospital." Particulars from the Sanitary Institute, 90, Buckingham Palace-road, S.W.

SEPTEMBER 1. — GOOLE. — MUNICIPAL OFFICES.—Premiums 30l. and 15l. Particulars from Mr. R. Tyson, Council Offices, Goole.

SEPTEMBER 9. — CHORLEY. — SCHOOL.—The Chorley Education Committee invite designs for Council school for about 600 children. See advertisement in issue of July 12. Premiums 30l., 20l., and 10l. Deposit, 2l. 2s.

SEPTEMBER 30. — DUBLIN. — UNIVERSITY COLLEGE: NEW BUILDINGS.—Limited to architects in Ireland. Assessor, Mr. H. T. Hare, F.R.I.B.A.

SEPTEMBER 30. — LILANLEY. — SCHOOL, ETC.—The Lilanley Education Committee invite competitive designs and estimates for school buildings and domestic subjects centre at Stebonheath-terrace. Assessor, Mr. G. E. Halliday, F.R.I.B.A. See advertisement in issue of August 2 for further particulars.

OCTOBER 14. — BALHAM. — SWIMMING BATH.—The Wandsworth B.C. invite designs for a Public Swimming Bath. See advertisement in issue of August 16 for further particulars.

OCTOBER 29. — GLASGOW. — DESIGNS FOR EXTENSION OF MUNICIPAL BUILDINGS.—The Glasgow Corporation invite architects to submit preliminary sketch designs in competition for the extension of the Municipal buildings. Five will be selected to submit complete drawings in final competition. See advertisement in issue of July 12. Dr. Burnett, assessor. Deposit, 1l. 1s.

OCTOBER 31. — HUNDSFIELD. — TOWN PLANNING.—The Housing and Town Planning Committee of the Huddersfield Corporation invite designs for the laying-out of certain areas within the county borough and part of an adjacent suburb. Premiums 100gs., 50gs., and 25gs. Deposit of 2l. 2s. See advertisement in issue of August 2 for further particulars.

NOVEMBER 1. — OTTAWA. — MONUMENT TO KING EDWARD VII.—Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa. Particulars from the Public Works Department, Ottawa (see p. 174, August 9).

DECEMBER 1. — BULGARIA. — DESIGNS FOR A ROYAL PALACE AND LAW COURTS.—Particulars from the Commercial Intelligence Branch of the Board of Trade, Basinghall-street, E.C. (see p. 173, August 9).

DECEMBER 2. — CARLISLE. — SCHOOL BUILDINGS, ETC.—Particulars from the City Surveyor, 36, Fisher-street, Carlisle.

*** FEBRUARY 1, 1913. — RANSOM. — MUNICIPAL BUILDINGS.**—The Committee of the Municipality of Ranscombe invite designs for the new Municipal Buildings. Honoraria of 300l., 200l., and 100l. respectively for first, second, and third. See advertisement in August 2 and present issue for further particulars.

NO DATE. — DONCASTER. — SWIMMING BATH, ETC., FOR YORKSHIRE INSTITUTION FOR THE DEAF.—Premiums, 50l. Information from Mr. B. D. Crouch, 6, Hall-gate, Doncaster.

NO DATE. — JORDANHILL, GLASGOW. — PROPOSED TRAINING COLLEGE.—Limited to six firms, named in "Competition News," December 1, page 635.

NO DATE. — MOTHERWELL. — HIGH SCHOOL.—Dr. Burnett, assessor. Premiums 50l., 30l., and 20l.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

AUGUST 24. — BANWEN. — CHAPEL.—Erection of small C.M. Chapel at Banwen, near Orlwyn, Neath. Plans and specification with Mr. J. S. Griffiths, architect and surveyor, Seven Sisters, Neath.

AUGUST 26. — PORTSMOUTH. — STORE.—For erection of a store for school supplies in the infants' playground of the Arundel-street Council School. Plans and specifications by the Surveyor, Mr. A. H. Bone, Cambridge Junction, Portsmouth.

AUGUST 26. — STOCKPORT. — WALL.—Erection of a boundary wall adjoining the Stepping Hill Hospital, Hazel-grove. Specifications seen, and particulars and forms of tender from Messrs. Peirce & Son, architects, St. Petersburg, Stockport.

AUGUST 27. — CONSETT. — ALTERATIONS.—For the proposed alterations, refitting, etc., at new Town Hall. Plans, specification, and conditions with Mr. J. J. Blithingham, Lic.R.I.B.A., architect and surveyor, Derwent-street, Blackhill.

AUGUST 27. — KEIGHLEY. — PAVILION.—Erection of a cubicle isolation pavilion for twelve beds at the Infectious Diseases Hospital, Morton Banks, Keighley. Drawings seen, and quantities from Messrs. Moore & Crabtree, architects, York-chambers, Keighley.

AUGUST 27. — NEWPORT. — MON. — SHOP.—For erection of electric car paint shop on site at Corporation-road. Plans and quantities, with forms of tender, from the Borough architect, Mr. C. F. Ward, A.R.I.B.A., Town Hall. Deposit of 1l. 1s.

AUGUST 28. — ALFORD. — ADDITIONS.—For additions to the Alford village public school. Plans and specifications with Mr. J. Reid, Brainley, Alford, and with Messrs. D. & J. R. McMillan, architects, 105, Crown-street, Aberdeen. Quantities from the architect.

AUGUST 28. — BOTSHELMING. — REPAIRS.—For roofing and general repairs to Hatt House, Botsheleming. Plans and specifications with Mr. Harold A. Hosking, architect, Landrake, St. Germans. Deposit of 2l. 2s.

AUGUST 28. — GLAMORGAN. — SCHOOLS, ETC.—The Glamorgan County Council invite tenders for the following works: New school at Bettws, near Bridgend; new school at Blaengwrach, near Neath; new school at Pontlllyf, near Pontardulais (removal of temporary building from Gorseion and foundation for same); new mixed school at Trebanos, near Pontardawe; Pontardulais Infant School, new heating chamber; Gowerston Girls' and Infants' school, alterations to offices. Plans and specification seen, and quantities at the Bridgend Police-station, Neath Police-station; Gowerston Police-station, Pontardulais Police-station, and Pontardulais Police-station. Mr. T. Mansel Franken, Clerk of the County Council, Glamorgan County Council Offices, Westgate-street, Cardiff.

AUGUST 29. — DRIFIELD. — ALTERATIONS.—For alterations to doors and other works at the engine house, York-road. Specification and plan from Mr. J. A. Brown, Clerk, 39, Exchange-street, Driffield.

AUGUST 29. — MANCHESTER. — HOME, ETC.—The Guardians of the Poor of the Township of South Manchester invite tenders for the erection of a nurses' home and additions to the hospital matron's office, sisters' dining-room, and maids' sitting-room at the Willington Workhouse. Quantities from Mr. J. A. Brown, Clerk, 39, Exchange-street, Driffield. Deposit of 1l. 1s.

AUGUST 29. — TRURO. — RESIDENCES.—For the erection of four residences at The Avenue, Truro. Plans and specifications with Mr. Leonard Winn, architect and surveyor, 37, Boscastle-street, Truro.

*** AUGUST 30. — SUTTON COLDFIELD. — SCHOOL.**—The Staffordshire Education Committee invite tenders for new Council school at Streely, near Sutton Coldfield. See advertisement in this issue for further particulars.

AUGUST 31. — ABERCORNAL. — HOUSES.—For the erection of a pair of semi-detached houses at Abercornal, for Messrs. T. & J. Williams. Plans and specification with Mr. R. Edmund Rees, architect, Bank-chambers, Merthyr Tydfil.

AUGUST 31. — BLANDFORD. — COTTAGE.—For erection of a new cottage on holding No. 12, Winterborne Winton, near Blandford. Plans and specifications at the office of the County Land Agent, County Offices, Dorchester.

AUGUST 31. — CHERTON. — COTTAGE.—Erection of a cottage at Landimore Farm, Cherton, Glos. Plan seen, and specification from Messrs. Harland, Isaac, Watkins, & Lewis, 7, Rutland-street, Swansea.

AUGUST 31. — DYSETH. — ADDITIONS.—For additions and alterations to Holly Cottage, Ochry-Pool, Dyserth. Plans and specifications from Mr. Williams, Cwyd Villa, Dyserth.

AUGUST 31. — GRAVESEND. — ROOMS.—For the erection of a sterilising room, store-rooms, etc., at the hospital. Specification obtained, and plans with the architect, Mr. Wm. M. Dean, A.R.I.B.A., 21, Park place, Gravesend.

AUGUST 31. — HYDE. — HALL, ETC.—A public hall, police courts, offices, and a public hall, Corporation-street, Water-street, field-street, Hyde. Plans and specifications and quantities and particulars from the Surveyor, Mr. James Diggle, Assoc. Town Hall, Hyde, on deposit of 3l.

AUGUST 31. — LEICESTER. — EXTENSION.—Extension of school roof, trusses, lattice columns required for an extension of car depot, Abbey Park-road. Plans and specifications, specification, and quantities from Mr. E. G. C. on deposit of 1l. from Mr. E. G. C. M.Inst.C.E., Borough Engineer, Leicester.

AUGUST 31. — RUTHIN. — REPAIRS.—Trustees of Bethania C.M. Chapel for repairs and alterations to the vestry. Plan and specification with the architect, Mr. F. A. R. Earl-chambers, Mold.

*** AUGUST 31. — SWANSEA. — NEW.**—The Swansea Exchange Building, tenders for new Exchange building of Adelaide-street and Cambrian advertisement in this issue for further particulars.

AUGUST 31. — SWINTON. — WALL.—Erection of a wall across a road 43 yds. long, in reinforced concrete from Mr. Henry Entwistle, C.M. Swinton, Manchester.

SEPTEMBER 1. — MINEHEAD. — COX.—Erection of convenience and lavatories on the sea front, Minehead. Specifications obtained, and drawings on 2l. 2s. to Mr. L. C. Webber, 10, 3, Bancks-street, Minehead, Somerset.

SEPTEMBER 2. — ABERDEEN. — EXTENSION.—Extension of fish market, adding Plans and details soon, and specifications, and form of tender from Mr. M. Inst.C.E., Burgh Surveyor, Burgh Office, Town House, Aberdeen.

SEPTEMBER 2. — COTTINGHAM. — HALL.—Erection of a parish hall. Drawings and specifications from the architect, Mr. A. C. 3, Alfred Gelder-street, Hull.

SEPTEMBER 2. — DARTFORD. — WORK.—Erection of certain works at the West-hill, Dartford. Plan and specifications from Mr. A. C. 3, Alfred Gelder-street, Hull.

SEPTEMBER 2. — NEW MALDEN. — EXTENSION.—Extension of the proposed extension to the rear of the municipal buildings. Plans and specifications, and quantities from the Engineer and R. H. Jeffes, A.M.Inst.C.E., at the Office, New Malden. Deposit of 2l.

*** SEPTEMBER 3. — BARNET. — HOUSES.**—Barnet U.D.C. invite tenders for dwellings in Tottenham-lane. See in this issue for further particulars.

SEPTEMBER 3. — MERTHYR TYDFIL.—The erection of girls' school and rect block at Troedyrhiw. Particulars from Borough Architect, Town Hall, Merthyr.

SEPTEMBER 3. — SOUTHAMPTON. — WORK.—For the rebuilding of 7, 8, and 9, statement of 11, Bridge-street, Hill, architect and surveyor, 9, Southampt. Quantities on paper.

SEPTEMBER 3. — SOUTHAMPTON. — WORK.—Carrying out alterations at R. Stroud. Plans and specifications with Mr. G. P. Milnes, 7, Rowcroft, St. Paul's, Southampton.

SEPTEMBER 3. — TRURO. — HOUSES.—Erection of ten houses in blocks I, J, and K, houses in blocks O, P, and Q, from the architect, Mr. R. Edmund Rees, architect and surveyors, 37, Boscastle-street, Truro.

SEPTEMBER 4. — BEDWAS. — HOUSES.—Twenty-six or more houses on the site of Joseph Davies, deceased, Bedwas. Plans and specifications from Mr. G. P. Milnes, 7, Rowcroft, St. Paul's, Southampton.

SEPTEMBER 6. — GOLCAR. — SCHOOLS.—The West Riding Education Committee, whole or separate tenders for works: Golcar: Crowlane C.O. additions (builders, carpenters, plumber, plasterer, and painter), and specifications with quantities on application to the Education Committee, County Hall, Wakefield, sent by separate letter to the Treasurer, County Hall, Wakefield.

ROADS, SANITARY AND WATER WORKS.

AUGUST 24. -**Prestwich. ROAD.**-For private street improvement in Highfield road, Back Bailey-street, Back Bury New-road, Mather-avenue, Mildred-avenue, and Mowbray-avenue. Plan, specification, and quantities at the office of the Surveyor, Council Offices, Prestwich. Quantities on deposit of 21. 2s.

AUGUST 26.—**Stone.** SEWAGE.—For the laying of sewers, construction of manholes, etc., at Lightwood. Particulars with the Engineer, Mr. John Twist Snape, 5, Lad-lane, Newcastle-under-Lyme on deposit of 5/-

AUGUST 27.—**Bolton**.—ROAD.—Formation of a new road from Plodder-lane to the Cottage Homes in Farnworth. Plans inspected, and quantities from Mr. John Ward, architect, 24, Mawdesley-street, Bolton.

AUGUST 28 **Chelmsford**.--WATER MAINS.--For the laying of water mains in Bishop's-road, Marconi-road, Swiss-avenue, and new road off Rainsford-lane. Forms of tender obtained, and the plans and specification at the office of the Borough Engineer, 16, London-road.

AUGUST 31.—**Clayton-le-Moors.**—PAVING.—For the taking-up and relaying of about 400 lin. yds. of kerbs, and paving, with granite on a concrete foundation, about 2,000 super. yds. in Barnes-street. Also repairing about 800 super. yds. in Whalley-road. Specifications seen, and forms of tender from Mr. A. Dodgeon, Assoc. M. Inst. C.E., Surveyor to the Council.

AUGUST 31. — **Dorking.** — **TAR MACADAM.** — The U.D.C. invite tenders for slag tar macadam for surfacing 4,043 sq yds. of road. Specification, etc., may be obtained on application to the Town Surveyor, Mr. William A. Clegg, M.Inst.M. and Civ.E.

AUGUST 31.—**Littlehampton**.—**GRANITE**.—For the supply of 300 to 400 tons of Guernsey or other approved granite, also for granite chips. Forms of tender from the Council's Surveyor, Mr. H. Howard, F.S.I. Town Offices, Littlehampton.

AUGUST 31.—St. Columb.—SEWAGE.—For constructing sewers and underdrains, and laying out irrigation ground and other work in connexion with the sewerage of St. Columb Major. Plans and specifications by Mr. R. Hansforth Worth, M Inst.C.E. Plymouth.

SEPTEMBER 2.—**ASPATRIA. SEWAGE.**—For the construction of sewage-disposal works, consisting of detritus tanks, open septic tanks, storm-water tanks, and percolating filters, with all contingent work. Plans, sections and specification of the Council Office, Aspatria, and at the office

at the Council Office, 25, Park-row, Leeds. Quantities on deposit of 20. 2s.

SEPTEMBER 3. **Middleton.**—**STREET.**—For the making-up of Hanson-street. Plans seen, specifications made and quantities from

Mr. W. Welburn, Borough Surveyor, Town Hall, Middleton. Deposit of 10s. 6d.

SEPTEMBER 3. — Southampton. — ROADS.—For executing private street works in the following roads, viz., Shaftesbury-avenue, Leighton-road, St. John's Down-road, and Morris-road.

Plans, specifications, and conditions inspected.
and quantities and forms of tender from the
Borough Engineer, Municipal Offices, South-
ampton. Deposit of 11. 1s.

SEPTEMBER 4.—**Skipton.—ROADWAY.**—For the
6-in. ~~roadway~~ 15 ft. in width and

construction of a roadway, is 10 in. width and about 250 yds. in length, at the Recreation Ground. Plans and specification seen, and form of tender from Mr Aldridge, Town Hall, Skipton.

SEPTEMBER 6. **Southend.**—ROAD.—For road and formation works in connexion with the construction of a 12 miles in length and

struction of boulevard 1½ miles in length and 100 ft. in width. Plans inspected, form of tender, quantities, and specification for the Borough Engineer. Mr. Ernest J. Elford, M.Inst.C.E., Municipal-buildings, Clarence-road, Southend-on-Sea, on deposit of £1. 5s.

street works in ten roads. Plans, specification, and conditions with Mr. T. A. Collingwood, Surveyor, Council Offices, Portsmouth-road, Wols-ton. Quantities and form of tender on deposit of £. 2s.

SEPTEMBER 9.—**Newington.**—SEWAGE.—For the construction of sewers at Newington. Plans and specifications with the Engineer, Mr. Leonard B. Grant, High-street, Sittingbourne.

SEPTEMBER 12.—Fishguard.—ROAD.—For the construction of 833 lns. yds. of roadway, together with concrete walls, wire fences,

with retaining and parapet walls, wire fences, surface-water drains, etc., at Dinas-hill, Fishguard. Plans and specification, conditions of contract, and form of contract seen, and quantities, with form of tender, at the Shire Hall, Aberfordwest, on deposit of 3*l.* 3*s.*

SEPTEMBER 2. —**Lewes.** **SEWAGE.**—For the construction of main intercepting sewers, and for the construction of sewage-disposal works, comprising screen chambers, buildings, settlement and storm tanks, tidal storage tanks, sludge-drying beds, low-level pumping station, and contingent works. General conditions, specification.

quantities, and form of tender obtained, and drawings inspected, at the office of the engineers, Messrs. Brierley Holt & Co. (Arthur Lindle, M Inst.C.E., and P. Holt Whitaker, A.M.Inst.C.E.), 46, Abingdon-street, Blackpool. Deposit of 5l. 5s.

L.M.Inst.C E.J. 46, Abingdon-street, Blackpool.
Deposit of 5L 5s.

OPTIMISM AND ARCHITECTURE.

HE optimist is seldom taken seriously, and has often himself to thank for it. He is either Quixotic or sentimental. As the first, only appeal to the few, the rarer surrounding him. As the second, positive danger, a social will-o'-wisp. He is intolerant of precaution. He is swans. Yet the true optimist is not to be judged by the standards of the so-called "practical" man, nor his premises be too scientifically. The proverb that "many a judgment has been spoiled by a doubtless composed by an. Though avoiding extremes, may look for something of the courage of the Spanish Don cometh the sympathy which evokes nt. Though assured, may claim as a companion, and even was an optimist at least when knowledge a divinity that shapes ds. And optimism primarily is we think, in the sense of being forward and not backward; of ating this general trend going nd us, although this or that may time be caught in a back-wash. possible, of course, by closing one's a railway train to produce ng of uncertainty as to which

direction we are travelling in. But to achieve this, we must shut our eyes.

It is said of some people that they go through the world with their eyes shut, and in their case confusions are likely to arise. Yet, while this inner and inexpressible sense of movement may be the possession only of some, developments, like passing objects, at least carry conviction to all, and a reasonable optimism may often be enjoyed without any demands upon our subliminal self. And a belief in a healthy progress of architecture, we think, may be so enjoyed.

In the first place, architecture of some kind must exist so long as communities exist. Certain races have existed, and still exist, that have been without the instinct for building. Nevertheless, they built, though they had to send to Tyre and Sidon for artificers, as did Solomon of old, or later, when the Arab relied upon the constructive ability of the Copt.

We may, we admit, stand amazed at the prodigious achievements of the past, and compare them to our own disadvantage. But the bare fact that we do admire them, have it in us maybe but to stand dumbly and wonder at the wealth and splendour of the imagination they embody, is in itself evidence that the living spirit that raised them

is not dead. Like Sleeping Beauty it awaits but the kiss, and who shall say that that kiss shall never come? It is only businesslike to ask whether modern conditions are consistent with great building as compared with those that have once prevailed, and, if not, whether these conditions are our masters rather than our servants. What in them demands the respect due to permanence, and what others have been foisted upon us by the exigencies of hurry and the misunderstanding of our needs.

It is scarcely possible to conceive conditions more adverse to architecture than exist at the present day. Great works of the past demanded time for their completion. Rome was not built in a day. Many a modern town is. Materials and labour were either commandeered, or the prices were regulated. There was no opportunity of going to the cheaper market. The gross expenditure was upon the building and not upon the land. These are some of the economical differences which exist, and they could be easily multiplied.

Social life then was less complex, and architectural planning, where it did not give expression to a single idea, was at least simple, and its *motif* was shown by the whole conception. Departmental demands not only complicate the plan, but complicate the whole. A guild-hall is

no longer only a single chamber. A dwelling-house is no longer a living-room, a solar, and a buttery.

Land was measured by acres and not by square feet, and the architect conceived his design in the same generous manner—with largeness and freedom. These are some of the changes forced upon us by social developments, while modern facilities of transit have transformed our conditions both socially and economically. Hotel life has become more popular than home life. Materials are no longer restricted by local production, and the architect suffers from an embarrassment of riches.

Are all these difficulties permanent and commanding of respect? Our opinion is that some of them, at least, are conditions that have grown up under a system of *laissez-faire* and must and will be dealt with. We are not suggesting anything revolutionary. It will be enough for us to instance modern developments in town planning to illustrate the line which may be legitimately taken towards a worthier comprehension of building enterprise. Other conditions have arisen through the misunderstanding and misapprehension of the advantages that progress has offered. To set forth the divergent aims of art and commercialism is almost a commonplace. Yet quite recently we had occasion to notice the great advance made by the reasonable co-operation of these two forces. Such combinations have been little more than experiments compared to the immense possibilities such a co-operation, generously pursued, would open up. Commerce may discover advantages of spending rather than keeping. The spirit of the old Merchant Adventurers may return and find scope in home lands rather than in foreign waters. Once couple imagination and capital—imagination that looked beyond the next quarter-day for a dividend—and few doors would be barred to it. This is not an impossible discovery. The developments of commerce, which have had everything in their favour for a century while art has been denied, may yet employ their advantages to some reasonable end. There is a divinity that shapes these, rough hew them even as the commercial spirit has done, and that there should be money in art generally and in architecture in particular (otherwise than in the trafficking with Old Masters) may not prove the paradox it sounds.

That some such impetus when it arrives would find architecture ready, we have no doubt. The young architect is to-day incomparably better trained than heretofore. It is the stimulus and the positive direction that are needed. This marking time and beating about the bush in which other activities besides architecture are engaged creates a restlessness that finds expression in evanescent enthusiasms and whims.

An interview with a firm of architects was recently given prominence in the daily Press. It advocated a return to that style of reserve and refinement that marked the beginning of the last century, when the architect, as it pointed out, was a man of culture and varied attainment. But the style referred to was the natural outcome of the classical

tastes of the time. We are far from agreeing that the modern architect is not a man of culture when we contrast him with the type referred to. Indeed, if he be cultured at all, his culture is unquestionably very much wider. Breadth was not a characteristic of the culture of two and three generations back. Its limits were strictly confined. What it did it did well. But its limitations were made obvious as soon as it was touched by the romantic revival. The verdict of the mighty *Edinburgh Review* upon Wordsworth was, "This will never do." Neither had the architect of the period the faintest glimmer of an understanding of the nature of mediæval design. Thrust into it by the Oxford Movement and Gothic revivalist, no longer supported by his knowledge of the Classic proportions, evidence of his floundering may be seen everywhere about the country. Wren and Wyatt we excuse. There was no element of romance stirring in their day. But their successors were impervious to the spirit of the time. They endeavoured to deal with mediæval detail as they had been accustomed to deal with the Five Orders. Wordsworth came to stay in spite of his reviewers, and the appreciation of Romance in Architecture has come to stay also. To say of this revival as Mr. Tootles might have said, "It is of no consequence, thank you," is to take up a dangerously empirical position. We are richer than we were, and it is our duty to spend of our increase. If the Victorian epoch can only be looked back on with mixed satisfaction, certain great works we accomplished, among which the Houses of Parliament are pre-eminent. To sum them up by the statement that they present a Classic plan and Gothic detail, and present this as a necessary shortcoming, is criticism misplaced. The successful combination justifies them as being typically English in character. Pedantry clogged the steps of the Gothic revivalists as it had clogged those of their predecessors. Certain of its leaders were unfettered, among whom the names of Burges, E. W. Godwin, and Pritchard at once come to mind, but recorded examples were as stone tablets of the law to the mere copyist.

To-day we are at any rate quit of pedantry. The ban has been removed from this and that means of architectural expression, which alone is evidence of a progressive intelligence being abroad, the fruits of which we may reasonably await in hope.

THE LATE MR. B. H. MANDER.

The estate of Mr. Benjamin Howard Mander, of the Manor House, Trysull, Staffs, and partner of Messrs. Mander Bros., of Wolverhampton, paint, varnish, and japan manufacturers, who died on July 11, aged fifty years, is valued at 115,373*l.* gross, with net personality 143,657*l.*

VACANT LAND CULTIVATION IN LONDON.

There are as many as 14,000 acres of unused land at present within the metropolitan area, and the Vacant Land Cultivation Society, which Mr. Joseph Fels founded twelve years ago, ask for funds to enable them to extend their operations. The society now control an aggregate of 80 acres, representing plots cultivated by 500 men and women and a gross retail value of produce exceeding 6,500*l.* Each plot-holder has grown 5*l.* worth of vegetables per annum in return for 1*l.* spent by the society.

A NOTE ON THE ARCHITECTURE OF BUDAPEST.

BUDAPEST is one of the picturesque cities in the world. It is almost, like some of the castles of the Rhine, picturesque to be really interesting. Views on either side of the Danube resemble bits of scene painted by a master. It is indeed so immediately attractive to the eye that one at first fears may not possess qualities of a serious character. With greater knowledge and revises one's first impressions as the merely picturesque. Budapest goes, it may be considered, some respects to Edinburgh, of the interesting Princes-street, have the drab and spacious Calton Hill, with its classic Arthur's Seat, may, in some respects, find parallels in the classical architecture erected to the memory of Sain and the fortress rising beyond right bank of the Danube. But the most important comparison made between Edinburgh and Budapest is the intensely national feeling of its inhabitants. The Hungarian people, many of the national characteristics of Scotland—his assertiveness, his belief in himself. It is said in Budapest and not in any jocular spirit—that of the Austrian-Hungarian empire is reversed at the death of the Sovereign to Hungarian-Austrian must, however, be remembered, connexion that the populations of countries do not vary to any great extent. Hungary has some millions of inhabitants against the eight millions of Austria. The result is therefore not the same as in England and Scotland, so that cannot serve as a precedent.

The national feeling of the Hungarians is expressed in the architecture of Budapest, which is almost entirely native, and it is expressed after a complex fashion, in which we find certain opposition to the same in Austrian art. The Houses of Parliament, for instance, in Vienna, is classic; the Hungarian building is a medley of styles, by a predominating Gothic influence, the total effect being something between the Royal Courts of Justice, the street and the Town Hall at London. Inside, the spacious meeting chamber, the two parties of the Legislature, extremely ornate and decorated, the niche possesses its sculpture. The Hungarian history, while the spaces are devoted to pictorial representation of national events or scenes, the whole building covers an area of 4½ acres, and was erected from the plans of Steindl, a Hungarian architect, between the years 1883-1885. The building, however, which occupies the most important site in Budapest, the Houses of Parliament, but the Palace which faces it from a lower level on the opposite bank of the Danube. The dynasty of the Hapsburgs, a dynasty of great builders, the architectural history of Vienna, for instance, can omit to mention the influence of the royal house

phases of its architectural development. The present emperor has exercised his power, but has been largely on his private purse for the great schemes in building for the improvement of his capital. We do not know to what extent the emperor has shared in the expense of the building and ornate grounds, for the serried rows of ascending terraces which together occupy so vast a space on the right bank of the Danube, and which no other European capital can boast, are a more imposing expression of the emperor's power. The effect of the Imperial Hapsburg at Vienna, so far as the position is concerned, is tame in comparison. If we, however, look at the finest architectural tradition of the empire, we should say that it exists in the style which is called Baroque. It is difficult to read the history of Budapest in its buildings; but we remain which possess historical interest of any antiquity. There are churches which may be compared to the Baroque churches of Italy, and of a later period the Imperial Palace, which, although enlarged by later emperors, has preserved the Baroque style of the main building commenced by Maria Theresa in 1749. Among the important buildings is the Palace of the Arts, built in 1896 by Haussmann; in which the architect, while adhering to the classic Orders of the Doric, has branched off into Renaissance forms and details which are rather Teutonic than Latin. The architects responsible for the buildings of Budapest as we see them are, as we have said, mostly of native and local origin, and in their buildings it would be to apply abstract architectural principles which do not also take into account national taste and temperament. The Magyar is not a man either of the blood of the Germanic or Latin races. Ethnologically considered, we think he is much nearer the Slav than really of the race. It would be difficult for him to surrender to the culture of the Latin races. On the contrary, some fifty years ago, the architects created some of the best buildings on a large scale, and the classic influence of modern architecture in Budapest there has apparently been the influence of the same kind. We, however, take into account one exception. Among these are the colonnades which lend effect to the statue of St. Gerhard, perched on the right bank of the Danube, and the background of the Millennium Monument which terminates the view of the city. On the other side of the Champs Elysées of the city, the position, which is largely independent of the adventitious elements which give Budapest, just as it is, its great charm as a city, is one of the most considered of town planning of the empire, in addition to the monument colonnade, we have on either side of the museums which contain the art treasures of the nation, and the background a bridge spans the river and provides a fine entrance to the Park.

But the large public buildings of the world would seem mostly to have been erected, and it is not to these that we must look for the most modern expression of the art of architecture, but to the shops, commercial and residential houses, and in almost all the large cities on the Continent a widespread influence is apparent which has as yet scarcely touched England. L'Art Nouveau is certainly the predominating contemporary influence at Budapest. What would we say in England, we wonder, to buildings which to a certain extent correspond to the Post-Impressionist and Futurist movements in the sister art of painting? With few exceptions there are few buildings at Budapest which would entirely satisfy the student educated in classic or Gothic art. A little while ago we heard two professors of architecture, an Englishman and a German, discussing the work of the celebrated German architect, Alfred Messel. "How do you reconcile his use of such-and-such forms?" asked the English professor. "Oh, we consider them most beautiful!" answered the German. "They are the forms of our national art." And this, we daresay, would be the answer of the Hungarian in regard to any criticism we might make in discussing the architecture of Budapest, which, in our view, possesses much of the restless element of the Czar's, the national dance. This expression of the new art may strike us as bizarre and meretricious, but, so far as Budapest is concerned, it is the outcome of a genuine feeling, and it seems to be arriving, especially within the last year or two, at a stage of development which will probably command more serious consideration than it has yet received.

NOTES.

Regulation of Advertisements. TO THOSE who use the highways for the purpose of enjoying some of the most picturesque scenery available near London, and not with the object of ascertaining the latest quack remedy or the best motor tyre, the announcement made in the daily Press that the Kent County Council has framed a by-law under the Advertisements Regulation Act, 1907, will give unmitigated satisfaction. The by-law is to apply to all parts of Kent excepting municipal boroughs and urban districts with a population exceeding 10,000, and prohibits the exhibition of any advertisement which shall be visible from any public highway or footway, or from any railway or open land or water open to the public, and so placed as to disfigure the natural beauty of the landscape. We believe this is the most drastic by-law which has yet been framed, but it must be remembered that under sect. 2 of the Act existing hoardings and advertisements have to be exempted from the operation of the by-law for a period of at least five years from the making of the by-law. Having regard to this provision of the Act, it is a pity that five years have been allowed to elapse since the Act became law. The difficulty experienced in framing a by-law that was sufficiently specific, and which in

the opinion of the Home Office was capable of being enforced, accounts for some of the delay, but Hampshire, it will be remembered, led the way, and passed a by-law a year ago.

The Trade Union Congress.

THE Trade Union Congress (the 45th) will commence its proceedings on September 2 at Newport (Monmouth). The number of delegates which it is announced will attend is 500, twenty-one less than last year, but they represent unions with an increased membership—some 2,000,000, as compared with 1,662,123. This is the second consecutive year which has been marked by industrial unrest, culminating in serious strikes. In 1911 10,247,100 working days were lost owing to trade disputes, and in the seven months of this year 38,840,300 working days have been lost from a similar cause. In such circumstances as these the Congress might well concentrate its attention on the question of trade disputes and the best means of avoiding strikes, which are having such disastrous effects upon trade at large, but especially on the working class community; but there is reason to fear that much of the time may be taken up in discussing less practical and important questions. The Dock, Wharf, Riverside, and General Workers Union has a resolution on the agenda relating to conciliation and arbitration, and the Typographical Association has a resolution relating to the enforcement of agreements on all persons employing labour in any industry in connexion with which some agreement has been arrived at between the unions and employers engaged in that industry; but these appear to be the only resolutions bearing directly on the above question. Neither the nation nor the unions themselves can long endure such a strain as has been put upon them in consequence of the reckless recourse to strikes, involving, as is the case with sympathetic strikes, persons between whom there is no actual dispute.

The Insurance Act Resisters.

THERE have now been three prosecutions against persons who have deliberately determined not to comply with the provisions of the Insurance Act, the latest case being that of a builder. In each case the magistrates have convicted and have imposed a heavy fine, but have consented to state a case. In those circumstances we refrain from commenting upon the merits or demerits of the points raised in defence. These points seem to have been principally that the Commissioners were not in a position to carry out at present some of the provisions of the Act relating to benefits, and that the regulations made under the Act were not in order and consequently were void. The former of the two points seems based on a contention that there is a contractual relation between those who have to pay contributions and the Commissioners; the latter point turns on the publication of provisional regulations. Both points, however, if there is any substance in them, would only afford temporary relief to those called upon to pay contributions under the Act, and we take this opportunity of

Fig. 1. Plan of the Hampstead Garden Suburb.

strongly advising our readers not to waste their money in this kind of passive resistance to the Act. The Act is vexatious in itself, and the multitudinous regulations issued under it almost daily render it even more incomprehensible than it was originally; but, apart from one or two test cases, nothing is to be gained by wholesale passive resistance, and persons aggrieved will do well to reserve their energies to secure amendment of the Act on constitutional lines.

THE HAMPSTEAD GARDEN SUBURB AND ITS ARCHITECTURE.

In the development of this large estate an opportunity has been given to members of the architectural profession to work out their individual problems with the knowledge that each unit is benefited and its value enhanced by its enforced correlation with the work of others. It is in this breadth of conception, this subordination of the unit to the mass, that the Hampstead Garden Suburb rises above the ordinary collection of residences. A piece of mosaic is something more than a number of small stones, and this suburb is something more than a series of well-designed houses.

It occupies a strategic point in the natural configuration of London's outer ring. The wide view northwards from the crest of Hampstead Heath begins with the suburb, and stretches out over and beyond it to the distant Chiltern Hills. But for the ordered development which is now assured over an area of more than one square mile the beauty of this view would in a few years have been merely historic. As it is, a new beauty is being added, and the increased interest given to the foreground does not detract from the value of the more distant view.

In 1907, in the midst of green fields, the first sod was cut; since then nearly seven miles of new roads have been made, well over 1,000 houses have been erected, and a population of 5,000 at least has grown up.

In the development of Greater London this has been the only instance of a railway having been carried out into the open country with the intention of attracting a population to use the railway. All other railways have waited for the population to come first. As originally schemed there was to have been a station on the Tube from Charing Cross to Golder's Green under Hampstead Heath, and, as it was felt that this would greatly try the pleasure-giving resources of the Heath, a Committee was formed in 1903, and after arduous negotiations 80 acres of land adjoining the Heath were purchased. The London County Council became possessor of the land, which was to be maintained as an open space for ever. So far efforts had been centred on securing an addition to Hampstead Heath,

but at the same time it was obvious that the policy of the railway company was certain to lead to the open land around Golder's Green being covered with houses. It was felt by the Committee that here was a great opportunity not only of securing an addition to the Heath, but of ensuring the maintenance of the unique prospect to the north, and,

three sides of the open space to be secured by the Hampstead Garden Suburb Trust, Ltd.

In analysing the reasons for the able growth of the suburb we find that the land was secured through the co-operation of the Eton College Trust, next place, the landlord (who is the Hampstead Garden Suburb Trust, Ltd.) with small profits, the maximum allowed by a self-obtained Act of 1903 being 5 per cent. Where only 5 per cent are taken on land bought below value a continuous development is possible.

Further than this, there is no other guaranteed surroundings have great attraction. The publication of principles of development, and the fact that the promoters of the suburb are strong enough to enforce these principles, given residents a feeling of security as to their amenities which is rarely obtained elsewhere.

It is especially to be noted, moreover, that the building is a large scale, entirely taken the place of building plots or small areas by individual owners. The Trust itself has not been able to undertake much beyond the making and general development of the estate, although it has erected the Central Square, staff cottages, drivers' flats, and cottage homes of some 25,000. The remainder of the work has been done by the building organisations. The Improved Dwellings Company has built a large number of cottages let to weekly tenants. Waterlow Court, which consists of self-contained flats. The Garden

further than this, of providing an example of town extension on model lines. Accordingly in the course of the negotiations the area of the 80 acres of open space was so arranged that a fringe of land was left on its east and west sides belonging to the Eton College Trustees. A larger portion to the north formed the remainder of the Trustees' land, and they agreed to convey all their property 243 acres in extent—round the

ent Company (Hampstead), Ltd., in hand the construction of houses designs of well-known architects, clients by arranging with their and obtaining estimates from large firms. The Hampstead Tenants, Ltd., and the Clubhouse, a large number of houses, the two blocks of shops, people's homes. This Society is to Co-Partnership Tenants, Ltd., on of various co-partnership buildings in different parts of the country, than half of the building on the has been done by the Tenants' which works by direct labour supervised by its own staff. The tenants hold the Society, but the bulk of the supplied by outside investors and Public Works Loan Commissioners. rents are limited to 5 per cent., and profits go to the tenants as a bonus. While principally building small property, the Hampstead Tenants, also responsible for some of the

best work in the larger houses, notably the northern side of the Central Square, designed by Mr. E. L. Lutyens, and Heath Close and Reynolds Close, by Messrs. Parker & Unwin, examples which are referred to and illustrated in this article.

The principles for which the Hampstead Garden Suburb stands are now well known. Planning, not street by street, but as a whole, enables the houses to be suitably grouped, and a definite restriction as to the number of houses to be allowed leaves room for open spaces between the groups. The Trust has limited itself to a maximum of eight houses to the acre. Besides the private gardens provided for each house, there are various allotment grounds, tennis-courts, bowling-grounds, and gardens open to the public. It is noteworthy that the orchard and the beds of flowers, although unfenced, have remained unmolested, and have shown that, although thousands of people have visited the suburb, the public has fulfilled the injunction on the notice-boards to "protect what has been

planted for their pleasure." Most of the roads have been planted with almond, cherry, acacia, maple, birch, and other ornamental trees, and hedgerows of sweet-brier, yew, holly, Japanese and wild rose have been provided in place of the ordinary fences. The natural beauty of the land is rigorously protected, and no trees are cut down where by any ingenuity of planning they can be left. While houses of very various sizes are built, the positions of the different types are definitely fixed. Generally speaking, the smallest houses are at the north end of the estate, the next class is on the western portion, while to the south are the larger houses, with beautiful views over Hampstead Heath. Sites for public buildings are allocated in advance, and several of these sites have been given by the Trust. Architectural control is exercised with a completeness hitherto unknown on the ordinary building estate. The position of houses in relation to those adjoining is considered. Suitable materials are insisted on, and a scheme of treatment for several adjacent houses may be laid down, to be carried out as the individual plots are built upon. All the roofs are covered with tiles, most of which are hand made and sand faced. It is not surprising that such forethought and control have produced a suburb of remarkable unity and individuality, bright with its open spaces, gay with flowers, and healthy from its elevated situation.

The general scheme of development, as seen in the plan reproduced herewith (Fig. 1), was prepared by Messrs. Parker & Unwin, the architects to the Garden Suburb Trust, in consultation with Mr. E. L. Lutyens. The very irregular shape of the ground and its varying slopes called for an informal treatment. The main thoroughfare, Hampstead Way, is in its winding route typical of most of the other roads. A note of formality is struck, however, in the lines of the roads and buildings grouped around the Central Square (Fig. 4), which rises high above the other parts of the suburb, and this stiffening pulls together and dominates the more sinuous lines of the outskirts. A subsidiary centre is formed by the village green, the club-house, and the elementary school in Willfield Way. The levels of the ground form a natural basin where Hampstead Way meets the Finchley-road, and advantage is taken of this to make four roads converge on an open space in the hollow, which will eventually be treated with ornamental water and be surrounded with shrubs and flower-beds.

A special Act of Parliament secured by the Garden Suburb Trust allowed, among other things, variations in the width and

D

construction of roads. A road not exceeding 500 ft. in length and giving access to a group of houses may be as narrow as 20 ft., provided the houses on either side are 50 ft. apart. The effect of this is that a feature of the general lay-out is the number of short *cuts-de-sac* of widths narrower than those usually prescribed by the by-laws. Groups of houses may be set in retired positions off the main roads (Figs. 2 and 3) and treated as architectural units, an improvement on the usual practice of dealing with each house separately. Scale is increased, the simultaneous notes are fewer and broader, and good architectural effects are obtained. When the closes are linked together by foot-paths, as, for instance, the series of paths connecting Willfield Way through Wordsworth Walk and Coleridge Walk with Erskine Hill, the principal objection to "dead ends" is removed and at the same time the charm of their quietness is retained.

The development scheme now being carried out as shown on the plan is in itself a great achievement, but there is something more to follow. In the early days of the suburb the plan was thought by most people to represent a complete scheme. But very soon, as success became apparent, negotiations were on foot with the adjoining owners, the Ecclesiastical Commissioners, for a large extension. Meantime it was impossible to disclose to the public the full inwardness of the Central Square, which seemed to belie its name in rubbing shoulders with the boundary. To this uncertainty as to the ultimate limits of the design is to be attributed a feeling of cramping here and there, which will be seen to have disappeared when the plans of the extension of the suburb are published. This extension more than doubles the area of the suburb, and opens out the country to the north-east across to East Finchley Station. The Hampstead Garden Suburb Trust has

agreed to lease 112 acres from the Ecclesiastical Commissioners, while Co-Partnership Tenants, Ltd., have taken up 300 acres more, making in all, with the original 243 acres, 655 acres, or over one square mile.

The land comprised in this great addition is being planned by Messrs. Parker & Unwin on broad, free lines, influenced but not absolutely controlled by the contours. A series of radial roads branches out from the Central Square with long, unbroken vistas across the valley to the north-east. On the opposite slopes two of these lines will terminate at important public buildings, while in the hollow between a market-place is proposed, with an adjoining open space 20 acres in extent. It is satisfactory to know that owing to the success of the original scheme it has now been found possible so largely to increase the area over which the governing principles of the garden suburb will extend.

Architecturally the suburb is dominated by the group of buildings which with conspicuous success Mr. E. L. Lutyens has placed on the spacious plateau of the Central Square. The two churches, one on either side, with a broad expanse between, are striking examples of modern ecclesiastical architecture in a setting which is unique. The spire of St. Jude's and the cupola of the Free Church will form a new feature in the landscape for miles around, as conspicuous as the spire of the Church of St. Mary, Harrow-on-the-Hill, which is clearly visible from the plateau. On the south side of the square stands the Established Church, closing the vista from the Heath at the top of Heathgate, and on the north side is the Free Church, forming the termination of the slope of Erskine Hill. On the east is the Institute—one wing only completed so far—and on the west the view is left open over a sloping orchard to the distant hills.

The Church of St. Jude, illustrated

on our Plates, is broad and its masses, and is strikingly its blending of round arched saucer domes, with details of a stately character. On the outside the note is the great street carried from ridge to eaves over aisles in an unbroken slope down a few feet of the ground, the rain-pipe from a stone eaves cornice

Fig. 8. Example of Street Int.

Fig. 7. Wordsworth Walk.

Mr. H. A. Welch, Architect.

brick channel, which is carried along the base of the walls, avoid down pipes, at the expense of in stormy weather. The transept not project on plan, are marked ridge and gables, with spacious windows on the crossing stands the lofty tower surmounted by a lead-covered nave and aisles are lighted by large dormer windows and by the window, but this end is temporary will be extended several funds are forthcoming. The walls with 2-in. bricks, the facings being grey with dressings of a rich red roofs throughout are tiled. The effect of the interior is not impressive unusual amount of timber in the where rafters, struts, and purlins riot in a confusion which is also necessary.

The Free Church (Fig. 5) is interesting as an example of concrete construction applied to and at present this construction indicated by the large beams trude from the temporary wall of end, supported on unfinished. The roofs, dormers, and brick treated in a similar way to the stone but instead of a square tower and the crossing there is an octagonal

Fig. 9. Group of Houses in Temple Fortune Lane.

Mr. E. Gay Dawber, Architect.

design tiled and surmounted by a
red lantern. The steep pitched
of the transepts in both churches,
their long semicircular-headed win-
dows are specially interesting examples
of brick design and craftsmanship.
The tower of the Free Church stands high
above the nave floor, which is not level, but
slopes considerably towards the west
end, an arrangement which, although not
favourable in some of the best designs
of nonconformist churches, and has much to
recommend it on the ground of suitability.

The church stands to the east of the
Manse, and the Manse occupies a
central position in relation to the Free
Church. Each house is a square block of
three stories, the hand of Mr. Lutyens,
simple, rather severe lines and an
absence of bay windows.

It is on the suburb a high general
impression of architecture, and, owing to the
impression of any cottage exhibitions
which have been held at Letchworth, with
the standard "freaks," the continuity of
the standard has been so well kept up that
the standard, principally in the neighbour-
hood of the northern part of Hampstead Way,
is more regrettable. If the promoters of
the scheme had been more certain of
the standard when the suburb was in its infancy
it is probable that the stricter architectural
control which is now exercised would
have prevented some of these eyesores.
There is no doubt that the standard of
the suburb has gradually been raised as the estate
developed and the certainty of its success

has been assured. Such a later portion as
Bigwood-road and the eastern part of Mead-
way shows both in the quality of the designs
and in the general grouping the good results
which can be obtained by an insistence on
the requirements laid down. Not only has a
tone been maintained on the suburb itself,
but the adjoining estates recently developed
show a distinct improvement on the usual
suburban type, an improvement obviously due
to the example of the garden suburb. There
are, however, one or two places where a better
design appears to have been shelved in favour
of another, possibly on the grounds of
economy. Where, for instance, is Messrs
Parker & Unwin's group for the Hoop
Lane entrance, which would have been much
preferable to the blocks which have lately
been built? And we should have liked to
see Mr. Edgar Wood's fine design for the
Heath end of Wellgarth-road carried out.

The accommodation provided and the size
of rooms in the various classes of houses are

Fig. 10. Houses in Meadway.

generally rather limited, and according to provincial standards would often be considered very insufficient. It may be that the increased possibilities of open-air life are taken into account in designing the houses. There is, however, a noticeable improvement in accommodation in the later types of houses.

The buildings on the Hampstead Garden Suburb may for convenience be classed under three heads:—(1) Dwellings for single families; (2) grouped dwellings, flats, and shops; (3) public buildings.

(1) Dwellings for Single Families.

(a) *Cottage Property.*—Some of the least pretentious cottages are those of the Improved Industrial Dwellings Company in Erskine Hill and Willfield Way. In Wordsworth Walk (Fig. 7) Mr. H. A. Welch has created a charming group of twenty or thirty cottages in several blocks on either side of a narrow *cul-de-sac*, terminating in a central block with an effective feature in half-timber work. Temple Fortune Hill, by Messrs. Parker & Unwin, is an admirable example of a vista on a straight street (Fig. 6). In the treatment of street intersections we notice occasional boldness and originality. The junction of Willfield Way and Temple Fortune Hill (Fig. 8 and Plate) has been very happily dealt with by Mr. C. M. Crickmer, who has also designed simply and effectively the northern part of Erskine Hill.

(b) *Small Houses.*—Houses of a slightly

larger type than the last are arranged in Hampstead Way (northern part), Willfield Way (southern part), and Temple Fortune Lane. In Willfield Way, Mr. George has secured a good street picture by several well-designed groups round with two old trees, and his square in Hampstead Way which bears the name of the architect is worthy of particular notice. This is the best piece of grouped design in the suburb, and forms the subject of the inset Plates.

In Temple Fortune Lane Mr. George has an excellent group, illustrated by Mr. T. M. Wilson's block in (Fig. 10) is an instance of a good treatment of semi-detached houses.

(c) *Larger Residences.*—The immediately to the north of the Square call for special comment, on one of the highest parts of the suburb.

have been designed in a continuous and two sides of North Square and groups on the west side of Erskine. E. L. Lutyens, the architect of these houses, has been very successful in his treatment, which is quite different from the "cottage" architecture of the ground below. A sketch in Fig. 11. Silver-grey bricks are the general work, with red-brick stone is employed sparingly for windows and doorways. A skilful effort is overcome the difference in levels of the roofs to maintain an even ridge line, strong cornices carried level round the groups at first floor or eaves, as in North Square being sunk below the road; the back elevation is in this respect, as the ground slopes to the rear. The interior planning has been sacrificed to the symmetry of elevation. A large and important front window should light something in an office.

Close and Reynolds Close Messrs. Unwin have adopted a brick treatment rough-cast, and the result is dignified. The houses in Heath Close are linked up with large first-floor or open-air rooms. This connexion is architecturally, but the average of a house of this size has a persistent unreasonable preference for a "cottage" building.

Close (Fig. 12) is another very satisfactory example of fairly large houses grouped and set clear of the traffic roads. The Georgian houses, mostly designed by Mr. Michael Bunney, are very satisfactory. Originally three were designed separate houses in style, but they met, and mutually agreed to the level of the eaves, and the lines of the whole group, while freedom in the matter of detail; it is one of the instances of that correlation of facts which is so desirable.

Southwards over the Heath are the largest houses, detached, with a dense adjoining the "great wall" divides the built-up suburb from the Heath. At intervals along the wall are houses or look-out towers, and the when completed, will be a distinctive feature in the suburb (Fig. 13).

Grouped Dwellings, Flats, and Shops. The plan of the suburb is not completed, but houses are provided for families. It is also at housing the fragments of the and the individuals, who, together with the complete families, make up the

Fig. 16. Block of Flats over Shops, Finchley-road : Back View, from Hampstead Way.
Messrs. Parker & Unwin, Architects.

population of any centre. It has succeeded in part at least of this aim, as witness the homes for aged people, picturesquely called the Haven of Rest and more commonly known as "The Orchard," the cottage homes where those needing care, protection, and assistance will live under adequate and suitable administration; and Waterlow Court, where ladies earning their own living are lodged in self-contained flats with a common dining-room, reception-room, kitchen, and household staff.

The aged people's homes are in a two-story quadrangle designed by Messrs. Parker & Unwin, with an exterior balcony and stairs giving access to the upper floor; a sketch of the original design made by Mr. C. P. Wade is reproduced herewith (see Fig. 14). The flats contain living-room, scullery, and bed-recess, with the use of general oven, baths, and laundry.

Waterlow Court, designed by Mr. Baillie Scott, forms the terminal building in Heath Close. Seen from the Close it presents a long range of half-timber work, with a low entrance-way in the centre leading through the building and guarded by heavy gates. Beyond the entrance the building stretches foursquare, with low-arched cloisters round an open court (Fig. 15). This quadrangle is very attractive, and the whole effect of the building imparts a quiet, conventual air which makes it difficult to realise that across the fence is the busy "Tube," used as their

daily conveyance by many of the residents. Waterlow Court has been in existence for some years, and it is a little surprising that no similar building has been erected as a men's hostel. It should be possible to improve on the usual private lodgings by a house specially designed for the purpose.

While the suburb is not a self-contained town, dependent on itself for retail stores, and while an important shopping centre has sprung up just outside the suburb at Golder's Green Station, it has still been found advisable to provide a number of shops near the other end of the suburb. These are located in two interesting blocks on Finchley-road, one on either side of the entrance to the suburb by Hampstead Way, erected by the Hampstead Tenants, Ltd., from designs by Messrs. Parker & Unwin. The buildings are distinctly mediæval German in character, story piled on balconied story until they overflow among the high-pitched roofs and finish at last in a square tower covered with steep hips. The ground floor is used for shops, with a straight frontage line from end to end, while the frontage line of the upper stories breaks forward at either end of the blocks to form an arcade over the end shops. The arcade piers and arches are in ashlar work, while the rest of the walls are in brick of a well-variegated tone. Oak half-timber work, with brick filling, and oak balconies are features of the front elevations. The well-designed wrought-iron balconies were carried out by the Artificers' Guild. The flats and offices on the upper stories are approached by a broad outside balcony near the first-floor level, extending along the back of each block for its whole length over the rear of the shops. Outside staircases lead up to this balcony from the street level at the ends of the blocks. The south block, which has just been completed, is centrally heated. The massive stretch of these buildings on either side of Hampstead Way forms an effective and picturesque entrance to the suburb. The back elevation (see Fig. 16) is equally prominent, making a fine background to the public garden at the foot of Temple Fortune Hill, while it serves to screen off from the dwellers in the suburb a rather doubtful group of buildings just beyond. The blocks are a happy contrast to the usual type of suburban shop property.

Another building of a kind not often met with is the block at the end of Corringway, consisting of motor garages, with flats above for chauffeurs and their families. The idea of confining within small limits the noise inseparable from the care of motors is a sound one, but it does not necessarily follow that all the chauffeurs and their families should for their sins be confined within these same limits. What have they done to deserve such a punishment? Surely there might be arranged a small inferno for motors only, leaving the families to inhabit, like others, the paradise of the garden suburb.

A group of small flats, at the north end of Hogarth-hill, designed by Messrs. Parker & Unwin, shows that an architectural effect can be obtained even where the tenants pay only

Fig. 15. Waterlow Court : Interior of Quadrangle.
Mr. M. H. Baillie Scott, Architect.

5s. 9d. a week. This group, with the two others on the opposite sides of the road, is another good example of the treatment of street junctions. Near the same place a series of small buildings with four small flats above and four below, designed by Messrs. Parker & Unwin, indicates the desire for this type of accommodation. A block of good-sized flats is now being built, and another large quadrangular block which is being designed in the collegiate style by Mr. G. L. Sutcliffe, the architect to Co-Partnership Tenants, Ltd., is to contain a co-operative kitchen and a large dining-hall for the use of the tenants.

(3) Public Buildings.

When all the people are housed and provided with shops there still remains the question of their indoor recreation and education. To this question the suburb gives an answer. Besides an elementary school, which is being built by the Hendon Urban District Council, and the well-grounded hope of a secondary school, there are two buildings round which the educative and recreative life of the suburb centres. The Clubhouse, on Willfield Green, is the property of the Hampstead Tenants, Ltd., and carries on a varied and valuable organisation for social enjoyment. Messrs. Parker & Unwin have designed the building to form one side of an irregular village green, and the long sloping roofs and simple yet picturesque treatment of the tower are in harmony with the situation as thus conceived. The position of the tower, apparently haphazard, is in reality well thought out to form a notable landmark.

The other building which has functions similar to the Clubhouse is the Institute, occupying one of the most important positions on the suburb. It forms part of the comprehensive scheme for the Central-square laid out by Mr. Lutyens, and when completed it will be axial with the east, and west line through the centre of the square. So far only one wing has been built, but it is sufficient to indicate that the completed design will be a valuable addition to the architecture of the suburb. It is treated in the Renaissance style, and harmonises well with the neighbouring buildings. Classes, conferences, and debates are held in the Institute, which forms the centre of the intellectual life of the suburb, a source of keen interest to Mrs. Barnett, the founder of the whole movement.

Finally, beyond the housing of the people and their social and educational welfare, their religious needs remain to be satisfied. And as these are higher than the former it is reasonable, as well as symbolic, that the tangible and visible expression of religious aspiration should be placed on the highest and most commanding site. So it is that when we rise up to the level of the Central Square we find here the two churches of the suburb, which have been described earlier in this article.

Standing there on the central plateau, to which we have climbed up from the lower levels, we look down below to the west and to the north and to the south, and see the clustered red roofs among the gardens and the towers over the Club and the shops, reminding us of the varied life going on around, and displaying the result of definite and organised effort, consciously directed towards the producing of order and beauty in the homes and surroundings of the people. And then we turn and face the east, where the great virgin area of green fields and woodland, as yet untouched, lies open to the builder, and we look forward with hope in the knowledge that on this land, too, the seal of the Garden Suburb is set.

GENERAL NEWS.

Co-partnership Festival.

At the Co-partnership Festival held on the estate of the Ealing Tenants, Ltd., on Saturday last, there was an exhibition of plans and drawings of the various developments which are now taking place at Liverpool, Hampstead, and elsewhere in connexion with the Co-partnership in housing movement. It was announced that of the 450 houses on the Ealing Co-partnership estate only one is now unlet, a state of things which also prevails at Hampstead. The exhibition was under the direction of Mr. A. J. Flint and Mr. A. E. Aston of the Co-partnership Tenants, Ltd.

Protection from Fire, Hampton Court Palace.

It is anticipated that the Palace is protected from fire, as far as human precautions can provide, by means of the new high-pressure water supply which was installed a few months ago and supplemented with many improved appliances. Every apartment in the building is now newly numbered, so that each of the resident firemen can read the alarm bell by his bedside, which indicates, thrice, the precise place where fire has broken out. The new installation of alarms is that of the Gamewell system, and is in connexion also with the homes of the firemen who live in Hampton and Molesey.

Penrith Castle.

The site, about 7 acres, of Penrith Castle is about to be purchased from the London and North-Western Railway Company by the Urban Council at a price of 1,800*l.* for purposes of public works and pleasure-grounds. The Castle is constructed of the local red sandstone from which the place took its British name, and was originally erected, it is supposed, as a protection from incursions of the Picts and Scots. Richard, Duke of Gloucester, who for five years was Sheriff of Cumberland, made it his residence. The structure was dismantled in the course of the Rebellion, and much of the materials were sold.

La Grande Chartreuse.

The Minister of the Interior has sanctioned the expenditure necessary for repairing the roof of the now secularised monastery, which it is expected will be registered as one of the "historical monuments" of France. A project is entertained for the conversion of the buildings as a natural science museum, with observatory, laboratory, and botanical garden, more particularly for resident students of the flora and geology of the Alps, and to be affiliated to Grenoble University.

The Preservation of a Perthshire Castle.

Official announcement is now made of the placing of the historic castle of Huntingtower under the protection of the State for preservation. The castle, which is situated about three miles from Perth, was offered to the Office of Works by the owner, Major Mercer, of Huntingtower, and the Office of Works have accepted the offer under the terms of the Ancient Monuments Act.

New Stock Exchange, Genoa.

The Nuova Borsa has just been inaugurated in Genoa. It was built upon the Piazza Delferrari, of grey granite, after designs in the Renaissance style of Signor Dario Carbono, of Rome, at a cost of 250,000*l.* The interior decorations being by Signor A. Coppede, of Florence. The former Loggia di Banchi was erected in 1570-95, from Vannoni's plans and designs, as completed by G. Doria; in 1839 the Commune gave it over to the Chamber of Commerce, who restored and redecorated the fabric sixty years ago.

Stained Glass Windows at S. Barbara's, Ashton-under-Hill, Evesham.

Three stained glass windows have been placed in the chancel of the Church of S. Barbara, Ashton-under-Hill, Evesham. Those on the south side are designed with figures of the four Evangelists enclosed with borders and canopies. The north window represents S. Barbara, the Patron Saint. S. Barbara, with the Sacramental Cup in the first light, with an angel carrying a harp and chanting in the adjoining one; above these figures a choir of angels with musical instruments and carrying the crown, and in the tracery her emblem of the Tower. The windows were designed and painted by Messrs. F. Holt & Co., Warwick.

Property Sales.

The list of more important properties recently placed in the market includes Swinton, in Bervickshire, extending over 1,160 acres, which belongs to a family now represented by Mr. J. E. B. Swinton, of Swinton Bank, Peebleshire, in whom it has continued since the time of King Edgar, and one of whom, namely, Liulf, of Swinton and Bamburgh, is the first individual Scottish subject whose ownership of land can be attested by extant contemporary documents.—Swarthmoor Hall, Ulverston, built temp. Elizabeth, is memorable as the home of Mrs. Margaret Fell, widow of Judge Fell, who married George Fox in 1669. Fox built the meeting-house at Swarthmoor, where, and in the Hall, are preserved many

personal relics of him.—Caythorpe Castle, Grantham, was built for the late M. Lubbock, after Professor Reginald P. designs, upon an eminence overlooking the Vale of Belvoir towards Belvoir Castle, Creeksa Place, Burnham-on-Cree, in 1569, one of the most interesting Tudor houses in East Anglia, and of some fine oak work and stained glass. Hendon Hall, Middlesex, a Georgian mansion associated with Garrick, who was its

The Road Board.

During April-June last advance aggregate amount of 123,315*l.* have been with approval of the Lords of the Treasury of the Road Improvement Fund to councils and other highway authorities. Of the grants in respect of improvement works—including grants for tar macadam, and surface-tarring—absorb 105,186*l.*, and the rest being for widenings and improvements of corners and bends. A sum of nearly 1*l.* further indicated towards projects under consideration, and the Board announced are prepared to contribute 875,000*l.* the making of the contemplated works from London to Hounslow, by way of Smith and Brentford. In their second report, just issued, the Board express the opinion that this is "one of the most important of its kind in the public improvement of the present time," and that "some part of the Fund should be used for assisting a number of large schemes for improvement approaches to great cities or towns." The case of London, in particular, is deserving first consideration. The new eastern road, if fully carried out is estimated to be 1,750,000*l.*

All Saints' Church, Newland, Gloucestershire.

The much-needed work of repair and renovation of this church has now been brought to a conclusion. The alterations have cost 1,000*l.* The church is a building in the Decorated and Perpendicular styles of architecture, and among its features is an interesting font of 1601. In the aisle is an altar tomb of the time of Edward with recumbent effigies of Sir John and his wife, while in the north aisle is a monument to Sir Edmund Probyn, Baron of the Exchequer, 1740. Each of the chapels possesses a picture of the Virgin and Child. The beautiful ambury is contained in the tower. The ancient rood stairs still remain. The church was restored in 1882 at a cost of 1,000*l.* In the churchyard are the steps and the ancient stone cross, and also a rare monument with the recumbent figure of a man in costume.

Electric Street-Cleaning Machines.

German municipal authorities are now using street-cleaning machines of improved design and operated by electricity. The machine comprises a water-tank, brushes, and rubber scrapers, and a forty-cell storage battery providing power for working the brushes and scrapers. It is stated that some twenty machines of this type are at present in Berlin, the machines being able to travel at speeds up to 9 miles an hour and from 18 to 25 miles a day. The battery is recharged at different points in the city.

The Growth of Coventry.

An inquiry was held by Mr. R. G. H. Sutton, M.Inst.C.E., Local Government Inspector, at Coventry, on the 15th ult. regarding the application of the City Council for an increase of the rate of 10*l.* per 100*l.* of rateable value, amounting to 80,757*l.* required for the improvement of municipal buildings and for various improvements necessitated by the rapid growth of the city. The Town Clerk (Mr. Sutton), who supported the application, explained that the cost of the municipal buildings would be 100,000*l.* The design was accepted in an open competition which 160 architects entered. He explained the need for the buildings, pointing out that the present offices of the city were scattered about the town. The proposed scheme would include a Council chamber, committee-rooms, but not a town hall. Town Clerk mentioned that 12,000*l.* was required for surface drainage of Earlston and Chapel Fields, 280*l.* for improvements, and 1,477*l.* for the relief of tithe and land tax on the sewage farm.

BOOKS.

Structural Account of the Churches of Shropshire. By the REV. D. H. S. CRANAGE, D.D., illustrated with permanent photographs by MARTIN J. CRANAGE, with ground plans of the most important churches by W. ARTHUR WEBB, A. Part 10. The Liberties of Shropshire. Wellington, Shropshire. (H. K. Lewis & Co., 1912.)

In concluding part of Mr. Cranage's structural survey of the churches of Shropshire which has occupied him for the last ten years. As an essay in scientific method, free from the hoary errors and prejudices of the popular topographer, there is much to praise and little to blame in what has been a labour of love to its author. The photographic illustrations are excellent, and technically beyond reproach; they would have been better, for the sake of uniformity, to have lettered the plans and names of the various parts of the churches. In the case of those which are not planned, the internal details would have assisted the reader in forming an idea of their size. Details of the architecture as they appear, however, are not so easily described, and there is no species of description to which a lack of lucidity is not liable. However, though such criticisms are not the order of the day, it is not to be said that the author's critical sense has succeeded in producing a work of considerable interest and value to the student of architecture. Shropshire is surpassed by few of its churches by many counties. Mr. Cranage points out, "the tower of the spire of Worcester, the font at Worcester, the fan vaulting at Tong stand out as of great importance." Apart, however, from the question of architecture pure and simple, the churches are rich in archaeological interest which appeal to a different instinct, and are the less of real importance. The Liberties of Shropshire, with which Mr. Cranage deals, the principal churches now more or less intact are Holy Cross, Claverley, to each of which considerable devotion. Though all east of the west of the former central tower of Holy Cross, the remaining portions, with the exception of the eastern bays and tower, offers a text which Mr. Cranage has expounded with great lucidity. The secular buildings which have, of course, long been neglected; it is interesting to note that the ruins on the site revealed the foundations of a house with an eastern apse of the type as those of Durham and Reading. The absence of lettering on the plan of the church renders the description somewhat tedious to follow, nor is the arrangement of the description itself any too clear. We are, too, that the piscina in the chapel in the north-east corner of the north transept, referred in the text to the same period as the XVth-century east window, is on the plan as XIVth century. The tracery windows in the ground floor of the porch are ascribed to "the XVth or the very beginning of the XVIth century." They are described as "the work of the ground stage, undoubtedly does belong to this period, and statement loses weight when we find the author does not hesitate to class the XVth-century inscriptions the arches to the XVth-century windows in the ground floor of the porch, in spite of the fact that the arches course very well with those of the XVth century. The case for a central tower, if it existed, at any rate intended, is clear. The example of a disappeared central tower at Claverley in Berkshire, where all four late XIVth-century supporting arches are untouched, but the upper part has been replaced, probably in the XVth century, and a west tower was added to replace it. The evidence of its completion is given in the form of bell-ropes on the internal arches. In the case of St. Mary's at Claverley the explanation is that the late

XIVth-century west tower was abandoned before it was finished in favour of a central tower, and that this again was demolished to secure a more uninterrupted chancel by the removal of the eastern arch, when the bell-chamber of the west tower was built in the latter half of the XVth century?

The beautiful little church of Battlefield, the date of which is fixed by documentary evidence between the years 1406 and 1409, is rendered doubly interesting from the fact that three of the windows have tracery of pure XIVth-century type, though their mouldings show them to be contemporary with the rest of the building. A still more remarkable example of recessive design is considered by Mr. Cranage to exist in the three-light south-west window of the still surviving Lady Chapel of old St. Chad's at Shrewsbury, which he is disposed to refer to the late XVth century. The evidence which he places before the reader is certainly in favour of such a date, though the design of the tracery, which is composed of foliated spherical triangles, and the wave-mould of the jambs, constitute, so far as the present writer is aware, an almost unique example of the tendency to "Decorated" influence, which is occasionally manifested in the Gothic of the later XVth and early XVIIIth centuries. The tracery of this genre is usually flowing, and seems to be founded upon the resuscitation of flamboyant type exemplified in the beautiful tomb of Abbot Wakeman, erected about 1540 in Tewkesbury Abbey; the geometrical forms, on the other hand, are almost entirely confined to variations of the foliated circle so dear to the mason of the early XVIIIth century.

The work concludes with a general survey of the ecclesiastical architecture of Shropshire, not the least interesting part of which is a careful analysis of the "low side" windows which still remain, illustrated by drawings and photographs.

Dansk Arkitektur. Gennem 20 Aar 1892-1912. (Copenhagen: E. S. Larsen & Hasselbalch.)

In this book we are presented with a most interesting series of plates illustrating the progress of Danish architecture during the past twenty years. These are prefaced by an introduction in which due honour is paid to MM. Herholdt and Meldahl, who were foremost among those who sought to stimulate a growth of national architecture, reinforced in no small degree by the study of the Renaissance in Italy. The examples show a strong appreciation of the picturesque, the brightness of the northern builder, despite the restraint imposed by a classic setting. The predilection for the pilaster rather than the column is evident. The influence of brick architecture, a traditional element, no doubt accounts for this, and the treatment of brickwork in some instances shows a most happy resource in the use of this material.

The mullioned window is almost universally retained in design, whose detail is otherwise formally classic, and this helps to impart a newness which would seem to be indeed a characteristic of Danish architecture. We think that those pioneers who set out to achieve a style worthy of their age and the history of their country have accomplished their purpose with a singular absence of that conscious effort which their work might not unnaturally have revealed.

Preparation and Uses of White Zinc Paints. By PAUL FLEURY. Translated by Donald Grant. (South, Greenwood, & Son. 1912. Pages xvi. +262.)

At a time when a Departmental Committee is concluding its labours on the question of restricting the evils of white lead paint the publication of this volume is particularly opportune. M. Fleury, at one time an advocate for white lead, approaches his subject from the standpoint of an expert who recognises the legal obligations imposed upon his country, and his conclusions may be summarised by the statement that white zinc may be substituted quite successfully for white lead, given willingness on the part of the workman to learn how to use the material aright—an opinion which we believe will be endorsed by authorities in this country.

The first five chapters (pp. 1-61) deal with general remarks on painting different surfaces, with detailed reference to the comparative properties and application of white lead and white zinc. These chapters also contain many useful formulae for making up zinc paints and some explanation of the discordant views of

writers upon their use and value. Chapter VI. deals with the testing of commercial white zincs, and gives an account of some classic researches which have resulted in the generalisation that four coats of zinc are equivalent to three coats of lead paint. Two chapters which follow are devoted to the work of the Dutch Commission and some criticism of its conclusions. Chapter IX. on the manufacture of white zinc, is most instructive as showing the great variations in this compound as produced commercially, and is followed by two chapters dealing with legislation imposed in different countries relative to the use of lead compounds.

The last chapter comprises thirty-eight pages dealing with methods of analysis (many quite of a simple and lay character) for painters' materials, and the book concludes with that most desirable feature, a good index.

That the translator has carried out his work effectively and is fully conversant with his subject is shown by a number of footnotes from his pen throughout the book, some explanatory, some critical. The text is a little verbose in places, but the book should certainly be studied by painters and manufacturers anxious to keep abreast with the trend of developments in this important trade.

The Painters' Pocket-Book. By ARTHUR SEYMOUR JENNINGS. (John Heywood, Ltd., and the Trade Papers Publishing Company, Ltd. 1912. 3s. net.)

This little book, though primarily intended for the use of painters and decorators, contains many notes that should be useful to architects. Simple tests of painters' materials, cautions as to the causes of stains, discoloration, and blooming in paints and varnishes, and various practical hints not found in ordinary architectural handbooks are given, and as the book is actually of pocket size a corner on the desk may well be found for it.

Reports of Rating Appeals. By E. M. KARSTAM and HAROLD R. WARD. (Butterworth & Co. 8vo. Pp. xxx. and 365.)

This little volume, as the authors point out in their Preface really forms a continuation of the series of reports of Rating Appeals, in which the last collection of reports by one of the present editors, Mr. Karstam, appeared in the year 1908. The present volume seems to be in every way up to the excellent standard set by the preceding ones, and will be found to contain serviceable reports of most of the rating cases of importance which have been decided in the Superior Courts since the issue of the last volume, together with useful selections from the decisions of various Quarter Sessions, the most notable of which is undoubtedly the elaborate judgment given by Sir Robert Komer and other magistrates at the Herefordshire Quarter Sessions, 1910. The general arrangement of the book is similar in character to that of previous volumes of the series. Part I. contains the reports of the cases heard at Quarter Sessions, and Part II. deals with the cases decided in the King's Bench Division, the Court of Appeal, and the House of Lords. The several cases which arose owing to the reduction in value of licensed premises consequent upon the extra duties imposed by the Finance (1909-10) Act, 1910, are very fully reported, and altogether the volume is arranged on a plan which should appeal not only to legal practitioners, but also to all who are in any way concerned in rating matters. It can certainly be cordially recommended as a useful and valuable addition to any legal library. There is a good table of cases and an adequate index.

BOOKS RECEIVED.

ESTIMATING. By T. D. L. PIPER. (Portsmouth: The Ubique Press, Ltd. 3s. 6d. net.)

FIRE PREVENTION AND FIRE PROTECTION. By J. K. FREITAG. (London: Chapman & Hall, 17s. net.)

REINFORCED CONCRETE RESERVOIR, EAST COWES. In reference to the "Engineering Note" in the *Builder* of the 23rd inst., describing the reinforced concrete reservoir, East Cowes, we omitted to mention that the reservoir has been treated with the waterproofing material "Ceresit," which was supplied by the British Ceresit Waterproofing Company, Ltd., on account of the Trussed Concrete Steel Company, Caxton House, Westminster, the whole work being carried out by the contractors, Messrs. Bradling & Co., East Cowes.

ILLUSTRATIONS.

The Hampstead Garden Suburb.

OUR inset plates this week consist of illustrations of buildings at the Hampstead Garden Suburb, and they are given in connexion with an illustrated article which appears on p. 250. The Church of St. Jude-on-the-Hill and the Free Church are both the designs of Mr. E. L. Lutyens, and their relative positions will be understood by reference to the plan of Central Square, given on p. 251. Neither of them has been completed so far, that of St. Jude awaiting the eastern termination of the chancel and an extension of the nave westwards, as well as the erection of the timber-framed and lead-covered spire seen in the sketch reproduced on one of the plates. The nave of the Free Church will likewise be carried further westward, but the central crowning dome and the east end are already finished. The contractors for St. Jude's were Messrs. Farnell & Son, of Rugby; and for the Free Church Messrs. J. W. Faulkner & Sons, of London.

The square of houses in Hampstead Way was designed by Mr. Geoffrey Lucas and carried out by Messrs. William Moss & Sons, Ltd., of Loughborough. The walling throughout is of red brick, relief being obtained in places by the use of dark headers; the upper part of the walling, except the gable ends, is rough-casted, and the roofs are covered with tiles. The houses at the junction of Willfield Way and Temple Fortune Hill were designed by Mr. C. M. Crickmer, and carried out by the Second Hampstead Tenants, Ltd. In the view we reproduce on one of our plates the clubhouse is seen in the distance, with its brick tower closing the vista.

MEETING.

SATURDAY, AUGUST 31.

The Institute of Sanitary Engineers.—Northampton centre. Arrangements have been made for a visit of members and friends.

COMPETITION NEWS.

A list of current Competitions is printed on page 268.

Huddersfield Town Planning Competition.

The Competitions Committee of the R.I.B.A. have considered the conditions of this competition, and while they cannot advise the Council to bar the competition they consider the conditions in many respects unsatisfactory.

R.I.B.A.: The Soane Medallion.

The attention of intending competitors for the Soane Medallion is called to the following modifications in the conditions:—

1. No restriction is placed on the size of the strainers, but they should be of reasonable size.
2. The plans, sections, and elevations to be drawn to 1-16th scale.
3. A section through the front buildings up to and including the rail heads of the lines to be drawn to a scale of 8 ft. to an inch.
4. Plans of the upper floors and basement need not be drawn.

Rangoon Municipality, Burma: New Municipal Buildings.

Messrs. Ogilvy, Gillanders, & Co., agents for the Rangoon Municipality, of 67, Cornhill, E.C., write for the information of intending competitors that the date in the conditions in Clause 28 has been altered from August 31 to September 28, and in Clause 14 from January 1 to February 1, 1913. The latest date for posting letters to reach Rangoon by the latter date will be the Indian mail of January 10, 1913.

Intending competitors are informed that the assessor is an Associate of the Royal Institute of British Architects and is Consulting Architect for the Government of Burma. The duties of the assessor will be in accordance with Clause 2 of the Regulations of the R.I.B.A. for architectural competitions.

The selected architect will have undivided responsibility for the carrying out of the work. The duties mentioned in Clauses 22, 24, and 25 of the Competition Conditions have been modified, and the duties of the selected architect will be those specified in the R.I.B.A. Schedule of Professional Charges. Clause No. 4 of the Conditions has been modified, and payment of the commission will be in accordance with the R.I.B.A. Schedule of Professional Charges. The plan numbered "6" in Clause 19 of the Conditions may be omitted by competitors.

CORRESPONDENCE.

Hot Water Supply.

SIR,—In Mr. Frederick Dye's edition of "Hood's Treatise on Warming Buildings by Hot Water" (third edition, 1897, Spott), and in the portion of the book dealing with hot-water supply, it is stated on pp. 437, 438, and 439 that draw-off services from a tank system should be taken from the main flow pipe between boiler and tank, and that if circulation is desired in such draw-off pipes they should be returned into the main flow again at a point higher or lower; and it is claimed that, provided the main flow terminates at a point high up in the tank, all the hot water will be drawn off before any cold water comes out at the tap.

I venture to state that this is quite an error, and, as the advice given must frequently lead to failures in the proper working of the tank system, I trust that I may be doing my professional brethren a service in pointing this out.

The author very pertinently points out that it is important to remember that when a tap is opened water flows towards it from both directions along the main flow, but he does not appear to see that if the draw-off services are taken from the main flow cold water very soon arrives at the tap by way of the boiler to which on the opening of the tap cold water immediately descends.

What, then, is the best method of ensuring that all hot water in the tank is extracted from the taps before any cold water reaches them? It is only possible to do this by connecting all draw-off taps to a pipe, leaving the tank either at the top or very close to it. And it is not possible to keep up a circulation in this pipe (unless all taps are above the level of the tank), because to maintain a circulation involves returning the draw-off pipe to the main flow (or return) at some point not higher than the lowest tap, for if it is carried upwards again there would be no circulation, as the colder water would not rise out of the dip so formed.

As soon as such a draw-off pipe, then, is returned into the main flow (or return), at a point below the level of the lowest tap, water on the opening of a tap begins to flow not only from the top of the tank, but also from the main flow or return, with the result that the hot water (if the circuit is made by joining to the main flow) from the boiler, a relatively small quantity, is soon exhausted and cold immediately begins to flow from the tap. Moreover, the tendency must be for only cold to flow out of the tap, and for the rest or hot portion of the twin flow of water from the tank to the tap to be overcome by the superior weight of the cold water, especially if the tap is nearer the level of the boiler than that of the tank.

It follows, then, that with taps below the level of the tank, as they usually are, we cannot get a circulation, and must put up with the inconvenience of drawing off the dead water which has become cold in the pipe before getting the hot. This, of course, is the main drawback to the tank system; but after that we can draw the whole of the hot water before getting any cold from the tank. This I hold to be the only certain and satisfactory way to connect draw-off taps to the hot water in the tank system.

W. B. HOPKINS, A.R.I.B.A.

Berkhamsted.

[** Mr. Hopkins's letter is not very clear, and shows some misconceptions. We assume that he refers to small domestic installations having a boiler at the lowest level and a hot-water tank above the highest fitting, the cold supply to replace hot water drawn off being introduced either at the bottom of the tank or at a point in the return pipe. The hot

draw-off services should, of course, be from the flow (which contains very full boiler temperature less only taken from the pipe by the air, rounding it). The extent to which off will disturb the regular flow circulating pipes depends largely proportions of the system—that is relative sizes of the pipes, together head of water combined with the in temperature of flow and return.

In a properly arranged system, it would not reverse the flow as M seems to think it would. There is change of temperature at the top it is run off for some minutes consec although the hot water withdrawn by cold which passes through the is heated on its passage to the sizes of boiler, etc., are seldom s as to maintain a constant tempera tap.—Ed.]

FIFTY YEARS AGO

From the Builder of August 3

The Pneumatic Despatch Com

THE second ordinary meeting of pany has been held, the Duke of B in the chair. The report of the stated that arrangements had been with the London and North-W pany for the carriage of parcels, not less than fifteen miles per ho a rate of charge not exceeding t rate. The railway company are al sites for stations at Camden and E free. The Despatch Company w lay down a 4-ft. tube to connect t and Euston stations; also a line latter station to a station in High also a line thence to a station at the new market in Smithfield; and a station in Gresham-street. The regretted that they had not bee make arrangements with the Po the Government departments.

* * * *propos* of the above, we f 1667 Denis Papin read a paper Royal Society, in London, in suggested a system of pneumatic but it was not before the XIX that anything was done on comm In 1824 a scheme was patented with the carriages propelled p inside it. A smaller tunnel fou with carriages outside it, was 1834. This scheme also failed 1839 Mr. Clegg patented an spheric railway." Experiments v with this system with a pipe 3 and 102 ft. long. The slot in through which the connexion vehicle was made was closed w tinuous leather valve. This sy installed on two miles of line Kingston and Dalkey (Ireland) in worked until 1855, and evoked interest that the French Governm 1845, voted a sum of 1,800,000 experiments to be made. The s also tried upon other British lines abandoned, and it seems to have realised that other methods offer advantages so far as the conv passengers or heavy goods was What is now called pneumatic de introduced in 1853 by J. Latimer C installed a tube, 1½ in. diameter an long, to convey written message the Central and Stock Exchange the Electric and International Company in London. This was the first of its kind in commercial improvements have since been r now the Post Office has more t miles of tube in use in London al tubes are of lead, protected by an of cast-iron; the bores are, for t "house" tubes, 1½ in., and for tubes chiefly 2½ in., with some 3 in

THE CAMPANILE, VENICE: ITS HISTORY AND RECENT RECONSTRUCTION.

The Campanile and Basilica of S. Mark, Venice.

no exaggeration to say that the Campanile of St. Mark at Venice is a unique position among the towers of the world. Dr. Compton alluded to this in the eloquent address which, in the Ducal Palace on April 26 last, he prefaced the opening within that Palace of a marvellous exhibition—the “Exhibition of the Campanile” (*La Mostra del Campanile*). “The tower of St. Mark,” he said, “is not an isolated monument, but a part of the life of the city, containing within itself all its history, its art and all its history, when it fell into ruin has no reason to be rebuilt. Instead of this it formed part of the whole—a part indeed of the tower and complex monument of which no one should or could be allowed to alter. And not only did the tower claim its tower, but Venice herself, her traditions hallowed to art, her lagoons with the wide sweep of the lagoon, and the sailor seeking with his soul the angel of gold in its summit.”

And the same sentiment of pride and affection running through all the

ages of V.ietian history. "The tower (*al campanil*)," writes a Venetian in the XVth century, "does not seem to be a piece of stone, but, endowed with senses and feeling, now he weeps, now smiles, now he speaks out loud, and then so low that it can scarce be heard. He weeps and sighs when he sounds the knell of punished crime ; he smiles when he rings a double chime of joy bells ; he speaks out loud with the *bora* (the north-east wind), his voice is low with the *sirocco* (the hot wind of the south). He wakes and summons to their labours every kind of people, from the Doge and his Councillors to the nobles, the priests, the doctors, the lawyers, the merchants, the artisans. Don't you really think that this is the watch-tower of the world ? (*Non ve par che questo sia un seggiolal del mondo*?) " And Sig. Luigi Serra writes this spring:—"As an integral part of the physiognomy of Venice, as a living expression of herself and her lofty spirit, as organically connected with and connecting the lines of the Piazza and the Piazzetta, and as watch-tower and herald of the skies, the Campanile was needed to reappear. And with it the Loggetta : for the Loggetta with its exquisite

grace tempered and softened the austerity of the tower."

The tower itself dates from the earliest years of Venetian history. The end of the IXth century has been suggested, and Sansovino seems to confirm this; but other authorities carry back the construction as late as the XIIIth century, when the Doge Domenico Morosini notes—"Under me was built the Campanile of S. Marco, of admirable workmanship." What seems probable (being supported both by old tradition, and by the latest researches into the foundations of the fabric and its material) is that there was a considerable lapse of time between its commencement and completion in its more definite form. These researches since its fall have revealed the fact that up to a certain level it had been constructed from Roman bricks, probably taken from Altinum and Heraclea, and this seems to confirm the tower to have belonged to the very earliest days of the Republic. Dr. Ricci alluded to this, too, in his inaugural address:—"Flying from the barbarians and their savage acts, insecure as the wave and as the ship, they had passed from Heraclea to Malamocco, from Malamocco to Rialto.

The Campanile in Construction, with the Movable Platform.

(By permission of Messrs. Alfieri & Lacroix.)

... But the power and name of Rome were still in the memory and soul of these peoples, and were yet invoked in vengeance of their slaughter by the Huns and Lombards. Therefore they willed their tower to be Roman—Roman

in its spirit, its material, its construction."

For this Campanile was essentially a watch-tower, and belonged to the whole period of the Republic to which of their city: from its great lagoons could be dominated and kept against barbarian invasion the first it was exposed to the elements, and again and again by lightning or partially burnt again in 1405 (when it was set on fire by the illuminations after the capture of Padua), again in 1489, when it was destroyed by lightning, and the *ridotto* of the tower, which stood then below, destroyed, falling stones—a disaster which was followed by such a violent earthquake in 1511 that for the first time its bells could be rung.

This was in the period when Venice alone against the leagued monarchs of Europe, Spain joining France (the Pope to despoil her. Antonio was then *Procuratore* of the Republic under his direction the *Protomastro* possibly working on the design of which had been made after 1450 constructed the Campanile in the style which it has held since, setting on the gilded angel, of which Sanudo wrote in 1513:—"May he take his place in an hour, and be of good omen to this Republic." Jacopo Sansovino added later (1564) to adornment his Loggetta, a little Renaissance design.

There seems to be little doubt that this *mastro*, Bartolommeo Buon, had shared the popular superstitions of the tower were extensive; and he had the hesitation in adding considerable weight to be placed upon those foundations.

It was the investigations of Boni, in 1885, which first led to the supposition that the foundations beyond the circumference of the base—a theory that subsequently were only too fully to confirm; see that while in successive years (more especially in that of Bartolommeo Buon's time)

had grown in height and weight, and the efforts of later generations, and the great work accomplished by the Loggetta (1537-42), to which the tower, which was thus completed within six years. Two sub-committees had been appointed for the materials and general supervision; and as the tower began to rise the "castello mobile," or movable frame-

407 sq. metres, or very nearly double the surface. The project for reconstruction was approved by the Municipality in December of 1905; and on April 1 of 1906 Count Grimani, as Sindaco, laid the first stone of the new tower, which was thus completed within six years. Two sub-committees had been appointed for the materials and general supervision; and as the tower began to rise the "castello mobile," or movable frame-

President Charles de Brosses, *Les Familles, écrites d'Italie en 1789*, a copy of which now lies before me, describing his visit to the church and the Ducal Palace (he wrote of the Gothic revival and actually calls the building, "un vilain monsieur, mais, sombre et gothique, du plus bel effet!"), must add next, "After the great tower which is near the islands and little towns which keep her company, the lagoons, and all the Comacchio as far as the Alps, Carinthia, Trieste, the Coasts of Dalmatia."

the old tower more than would never recollect quite such a new as this. Perhaps the gallant aid here by his lively Gallic he adds next, "Je vis de la foi, l'Épire, la Macédoine, l'Archipel, Constantinople, la grande et le grand seigneur."

old tower fell in 1902, involving the Loggetta in its ruin, but without any loss of life or damage to S. Marco ("He fell," said the "like a gentleman"—"cadeva uomo"), the impression in the dense; an impression of grief and which was echoed throughout the old, and which found utterance in the words of the Sindaco of Venice, Count Grimani. "It must rise again as, and as it was! (dove era)"

of patient reconstruction, from that promise has been accurately and we can recollect the which was awakened among the men, on the day of its inauguration, the Ducal Palace, after describing the great restoration of the Campanile under Antonio Boni, added: "In 1513 the work and the chronicler could note, the anile of S. Marco is now restored, the labours and industry of Antonio Grimani. Four centuries it, and it is still a Grimani who, in will and love of Venice, has great monument to rise again."

Boni was the first to examine, the foundations of the fallen tower to its reconstruction; and he died in June of 1903 by Cav. Luca When he, too, withdrew his place by a Committee, which was first in enlarging the foundations, been (as we stated) contained in the of the tower itself; and, present as the nucleus, they constructed a strong enclosure of Istrian at while the old foundations had perished of 222 sq. metres, the of the present tower cover

city, and in the restoration of the Angel which crowned the tower—the Committee reproduced on the second bell, the largest of those recast, the portrait of Pius X. and his signature.

The angel above mentioned (who represents the Archangel Gabriel) was very cleverly reconstructed in its entirety from the numerous fragments of his predecessor, and is connected with the summit of the tower by a very strong pivot of steel, while a movable metal staircase can be attached to his feet; the actual belfry is of iron, and arranged so as to minimise the oscillation caused by the bells, while it is of interest to note that the statues of "Justice" and "Venice" have been replaced, as well as the two winged lions which Napoleon removed during his power at Venice.

The bells themselves weigh, respectively, 3,625, 2,556, 1,087, 1,366, and 1,011 kilogrammes, and the angel (without the pivot just mentioned) 1,300; the tower itself from outside the ground to its summit weighs 8,900,000, and with its foundations included about 12,970,000 kilogrammes.

Our illustrations will give a very fair idea of the *castello mobile*, or movable platform, which was used by the workmen, while the materials were brought up to them by the lifts from within; and we believe we are correct in saying that this great work was completed without any accident or loss of life whatever.

Lastly, we would like to describe briefly the no less successful restoration of the Loggetta of Sansovino. We have already alluded to this beautiful construction, which replaced the earlier Loggia dei Cavalieri, and was erected by Jacopo Sansovino in 1540; the figures with which he adorned it had each their special significance—armed "Pallas," signifying the wisdom of the Senate of Venice, and its alert intelligence; "Mercury," denoting eloquence and the love of letters; and similarly the exquisite nude figure of "Apollo" and the draped "Peace," who extinguishes her torch. The Loggia had been completely crushed by the Campanile in its fall; and when Sig. Boni came to Venice after the disaster his first care had been to carry into the Ducal Palace all the fragments of sculpture from out the mass of ruined bricks. Then commenced the work of reconstruction, in many cases very difficult; in the group of the "Virgin and Child," the head, shoulders, and thighs of the little S. John had entirely disappeared, and there were no less than 1,600 separate pieces.

When Luca Belzoni, in 1903, succeeded Boni the reconstruction of the above group was handed over to Pietro Zei, and to Emanuel Musarelli the bronzes of the Loggia, as well as the angel. The result is entirely satisfying: Pallas now meets us as before, beneath the Loggia, armed, alert, and vigilant, and beside her Mercury, Peace, and the lovely young Phœbus are enclosed by those wonderful gates of Antonio Gai.

The scene of the opening of the Campanile on S. Mark's day (April 25) of this year was one never to be forgotten. The marvellous and unique surroundings the splendour of the pageant itself, as the representatives of the King, of Italy, of Venice, and the guests of honour, landing from the Bacino and advancing through the Piazzetta, were met in the Piazza itself by the Patriarch and his clergy coming forth through the opened doors of S. Mark—the stream of banners which followed the procession—and all this bathed in brilliant sunshine made a wonderful picture. But the psychologic moment of that day came when again the great bells—silent for ten years—pealed out their welcome, when the startled pigeons soared out into the blue, and the pure clear voices of three thousand children from behind the Palace joined in that triumphant song of Marneti:—

"Fratelli d'Italia,
L'Italia s'è desta!"

Venice had woke to life—and Venice stood for Italy! S. B.

The Campanile of S. Mark, Venice.

work, came into use, while for the carrying up of the materials a Steigler elevator was used, which also, when the bells had been recast, lifted them, on June 22 of 1910, very easily into their lofty place.

We were given to understand at Venice this spring that the bells had all been broken save one; the new peal was solemnly blessed on June 15 by the Patriarch of Venice, and—as the Pope had expressed his desire personally to share in the expense of recasting the bells of his beloved

THE BUILDING TRADE.

THE INSURANCE ACT: UNEMPLOYED INSURANCE.

WHEN the Insurance Act was passed and Schedule II. was before Parliament, which contains the "list of insured trades for the purposes of Part II. of this Act relating to unemployed insurance," we hardly think that it was contemplated that the application of this part of the Act would be nearly so extended as it already has become in practice.

The Chancellor of the Exchequer in introducing the Bill spoke of unemployment insurance being applied by way of experiment in certain especially selected trades, and the schedule contains seven trades:—Building, construction of works, shipbuilding, mechanical engineering, ironfounding, construction of vehicles, sawmilling carried on in connexion with any other insured trade. When it was proposed to apply this class of insurance only by way of experiment it was generally understood that the trades the subject of such an experiment would be definitely specified. How far this has not proved the case may be gathered from the decisions of the umpire appointed under sect. 91 of the Act determining the classes of persons who are to be deemed included or excluded from this part of the Act.

The decisions already published number close upon 800, and only those decisions are published which relate to classes of workmen or which involve some new principle. Anyone studying these decisions will see what confusion is arising under this part of the Act, and how impossible it is from these 800 decisions to frame any general guiding principles. Matters are made even worse when decisions are given which, as stated in the published reports, are intended to modify decisions already delivered.

We need hardly give examples; many of our readers have probably already had bitter experience of the condition of affairs to which we are now drawing attention. One instance will suffice. In the latest published report "workmen engaged in writing signs on buildings, ships, or vehicles," are held to be within this part of the Act, and this decision is intended to modify a decision by which it was held that "signwriters who are engaged wholly or mainly in the writing of signs and writing on office-doors, gilding letters, etc.," are exempt from this part of the Act.

Now, under which of the seven headings contained in Schedule VI. can writing signs on buildings be said to fall? All the specified undertakings appear to involve "construction" of something, unless it be "decoration," of buildings and ships; thus the conclusion appears to be that writing signs is treated by the umpire as "decoration."

If the experiment of unemployment insurance was intended to be a tentative movement, the trades to which it was applied should have been limited, and they should have been defined with accuracy. As it is, the definitions are of little use, and matters are made worse, as we have pointed out before (see the *Builder*, May 31), by sect. 107, subsect. 2, which provides: "In determining any question as to whether any trade in which a workman is or has been employed is an insured trade or not regard shall be had to the nature of the work in which the workman is engaged rather than to the business of the employer by whom he is employed." This subsection is entirely incompatible with the idea of an experiment limited to certain trades.

THE RAILWAYS: STRIKES AND INSURANCE.

THE statements made at the half-yearly meetings of the principal railway companies generally afford an indication of the prosperity or want of prosperity in the trade of the country and of trading conditions. The two features of the past half-year have been the loss owing to the coal strike and the increased charges imposed by the Insurance Act.

The London and North-Western Railway in the half-year showed a diminution of receipts of 193,541L., attributed to the strike, the Great Western a decrease in revenue of 234,348L., the Midland Railway 235,580L., and in consequence

most of the companies have declared dividends of about 1 per cent. less for the half-year.

In face of these diminished receipts caused by labour unrest a measure passed in the supposed interests of the working classes, the Insurance Act, is placing a severe additional charge on the companies. On the Great Western system this is estimated at 60,000L. per annum, whilst on the North-Eastern the charge is estimated at 40,000L., which represents $\frac{1}{2}$ per cent. of dividend.

Thus it is apparent that, whilst labour disputes have been the cause of serious loss in what should have been a time of commercial prosperity, legislation is seriously increasing the fixed charges.

In face of the cry for nationalisation some figures quoted by a proprietor at the meeting of the London, Brighton, and South Coast Railway are deserving of attention. He stated that in order to earn the amount divisible in the half-year on the ordinary stock, 93,080L., the company had to pay in rates and taxes and Government duty 118,478L. The income-tax had yet to be deducted from this, the net result being a sum earned for the ordinary stock proprietors of 87,659L., and for the Government and municipal bodies 123,908L. A similar statement could no doubt be made in connexion with the other companies. These Government and municipal charges are lost sight of when labour agitators accuse the shareholders of greed, and it is well that attention should be drawn to that proportion of the earnings which goes to the shareholders as compared with the proportion devoted to public purposes.

LAND TAXATION PROPOSALS.

QUESTIONS in the House of Commons have failed to elicit much information as to the Committee with which the Chancellor of the Exchequer is associated to investigate the question of the taxation of land values. It is said to be an entirely informal inquiry, but in formal inquiries under the aegis of a Chancellor of the Exchequer into questions which relate to future taxation are surely an innovation, and must have a serious influence on the value of the property likely to be taxed. Budgets are always kept secret because many forms of property can be so handled that if it is known that a tax is likely to be imposed that tax can successfully be evaded. The land, as we were constantly reminded when the Finance Act was introduced, cannot be removed, and in the 1909-10 Memorandum appended to the Report of the Departmental Committee on Local Taxation this fact is again dwelt upon: "The owner of land cannot withdraw it or conceal it." Until the year 1915 the full effects of the Finance Act cannot even be estimated, as the valuation cannot be completed until then; thus the land is already subject to taxation most uncertain in its incidence, and it is considerably depressed in value in consequence. Is this the time to talk of further taxation of the same subject? Extremists desire to tax the private ownership of land out of existence, and they may possibly be credited with the idea that the more the land is depreciated the easier will their object be accomplished, but we decline to believe that members of the Government can have any such object in view. We do, however, desire to draw attention to the very serious effect on land values and building enterprise produced by this informal inquiry into the subject of land values and taxation countenanced by a responsible Minister.

DRILL HALL, ALDERSHOT.

A new drill hall has been erected on Redan Hill for the Aldershot Territorials. The drill hall is 80 ft. long and 40 ft. wide. In addition, there are offices for stores for E Company, 4th Hants Regiment, the Hants Brigade Company, A.S.C., and the Hants Carabiniers, as well as rooms for officers and sergeants. On the first floor are a large lecture-room and a men's recreation-room, in which there will be facilities for various games. At the rear of the building are also quarters for the caretaker. The building is of red bricks, rough cast on the exterior, with a roof of asbestos slates. The builder is Mr. W. J. Snuggs, of Aldershot.

TRADE UNION MEMBERSHIP.

THE figures published in the *Labourer* relating to the membership of the trade unions appear to show a direct connexion between membership and militancy. The membership during the year 1906 was the largest recorded since statistics have been available for the purposes of comparison. The increase was 3,010,346, or 23.3 per cent. This increase of membership was most noticeable in those trades in which there were disputes. Thus the iron and steel trade, the transport trade in which the increase showed the largest increase, and the textile trade, in which the increase was the next largest, were the trades most affected by the increase. From the above statistics it would appear that the unions flourish in stormy times; militant policy is necessary to them to increase their membership.

Against such a deduction it may be said that the previous year showing a large increase in membership was 1907, a year in which a considerable number of disputes occurred. However, it may be pointed out that the exception of railway employees, in which the increase was the largest, was a disturbance of the trades which showed a decrease, and that that year was a year of considerable agitation in the railroads as between the trade union and the unions and the companies. In this year 1906 was the year in which the prominence was again given to the passing of the Trade Disputes Act, and in the year 1905 the increase in the membership of the unions was 1.2 per cent., in 1906 it was 10 per cent., and in 1907 13.4 per cent. It must be admitted that against the essentials to the maintenance of the trade unions as they are constituted.

GOVERNMENT BUILDINGS WORK.

MATTERS of importance to the building trade are discussed in the Report of the Parliamentary Committee on Estimates, which has just been issued. Referring to the Royal palaces, etc., the Committee states that they are informed that competition for work and materials are being invited, open competition, following public notice, if possible, or by limited competition among selected firms in special cases of building work, open competition, except in some instances, the provision of Labour. Existing buildings were adapted for new purposes, and the urgency of the work allowed time to prepare bills of quantities was stated that such works were more than 5000. The Committee hopes that in any similar provision of service, which may become necessary, such reasonable time may be allowed for the preparation of the necessary bills, and that the Office of Works to permit the Office of Works to plan in the most economical manner. There is an exception to the rule of open competition in buildings which the Committee considers to be proper. If the work to be taken involves exceptionally difficult or specially-skilled workmen, tenders are only invited from firms known to be capable of carrying out the work in a satisfactory manner. For repairs are needed in an ancient building, as Holyrood, or in a very elaborate building, such as the Houses of Parliament, only invited from selected firms, and that if open competition was entered, the lowest tender might be that of a firm which, though good enough for ordinary purposes, lacked the special skill and experience required for this class of work, minor, but not unimportant, point of this limited competition is the fact that men who are employed in the Royal palaces, including Westminster, become responsible for the safety of such places, where the entrance is not very desirable. Passing over maintenance contracts, the Committee states that this contract, in London alone, is worth about 200,000L. a year, and embraces all alterations and repairs exceeding 300L. The Committee

The restoration of the tower of Wellington Church is now being carried out, and some particulars of the work are given in a recent issue of the *Herefordshire Times*.—"An inspection of the interior revealed a condition of things at once pitiable and alarming. The Norman windows from the battlements to the Norman windows of the belfry, were two great gaps large enough for a man to stand upright. One of these, on the north side, had been deliberately made for the purpose of allowing the hammer of the old clock to swing free as it struck the bell. The other, on the south side, was a mere gap, the stone, as it may seem, kept in place with practically nothing to support it. These gaps have been filled up solid with cement concrete. Above each of the Norman windows immediately below the XVIIIth century masonry a concrete bander with an iron bar was inserted. This bander will serve to carry the greater weight of the XVIIIth century masonry which the Norman arches had before to carry."

Underneath the first bell framing, which consists of huge oak beams 14 in. by 12 in. thick stone corbels have been placed. These enormous beams, bearing the whole weight of the bells and framing, were found to be firmly fixed in the west wall of the tower the other but owing to the list in the tower the other end of the beam was held up by only 3 in. of stonework. . . . The stone corbels now hold these beams in perfect safety on their projecting brackets. Just above these beams was the weakest part of the tower. Here the chief pressure was felt from the heavy XVIIIth century addition pressing down from above, from the outward thrust of the enormous bell framing, and from the jar of the ringing bells. Here it is that four iron tie rods, 1½ in. each in diameter, with 4-in. plates concreted in with screw ends, have been fixed. By means of these the masonry has been screwed nearly 2 in. nearer to the perpendicular. Below the bell framing the north and south walls have been opened out, concreted, and faced with ash stone. In the clock chamber in future the bells will be rung. Here the walls were honeycombed with fissures. Above and below the windows concrete bonders, 4 ft. 6 in. long, have been placed. The work is being taken in hand by Messrs. Beavan & Hodges, of Hereford, to the plans of Mr. Bettington. All the features of the Norman building are being preserved.

DUNFERMLINE LIBRARY EXTENSION.

Plans prepared by Mr. James Shearer, architect, in connexion with a large extension of the Central Library at Dunfermline, have been accepted by the Public Library Committee. The cost is estimated at about 11,000l.

SPINNERS' HALL, BOLTON.

A new building has been erected for the Bolton Operative Spinners Association from the designs of Messrs. Potts & Hennings, A.R.I.B.A., architects. The building contains three assembly halls, accommodating respectively 750, 300, and 160; also nine offices, retiring-rooms, kitchen, and caretaker's rooms. The contractors are Messrs. William Townson & Sons, Ltd., and the hall was formally opened on Saturday last.

BANK IMPROVEMENT, WOLVERHAMPTON.

Extensions and alterations are to be carried out at the Metropolitan Bank, in Lichfield-street. The architects are Messrs. Cossins, Peacock, & Bewley, of Birmingham, and the scheme involves the demolition of the present bank premises and the erection of a three-story building with frontages executed in Darley Dale stone. The builders are Messrs. T. Elvins & Son, of Birmingham.

TRADE NEWS.

Under the direction of Messrs. Yeates & Jones, architects, Worcester, Boyle's latest patent "air-pump" ventilators have been applied to the Girls' and Infants' British Schools, Worcester. Under the direction of Messrs. William & Segar Owen, architects, Warrington, the firm's latest patent "air-pump" ventilators have been applied to the new dining hall, Warrington Workhouse.

The Crompton-road School, Macclesfield, are being supplied with Shorland's warm-air ventilating patent Manchester grates and patent exhaust roof ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester. The New Schools, Fakenham, are being supplied with the firm's patent exhaust roof ventilators.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Proposed extensions to fish market (5,800l.). Mr. W. Dyack, Surveyor, Burgh Hall, Aberdeen.

Barrow (Suffolk).—Six houses: Mr. A. R. Cameron, Surveyor, Rural District Council Offices, Thunpoe.

Cheltenham.—Hospital buildings (780l.). Mr. J. Meek, Clerk, Guardians' Offices, Cheltenham.

Chinley.—Twelve houses, Green-lane: Mr. J. W. Jackson, Fishguard.

Clatterbridge.—Extensions to workhouse: Mr. J. E. J. Ollive, Clerk, Wirral Guardians, 54, Hamilton-street, Birkenhead.

Coatbridge.—School, corner of Drumpellier-street (2,700l.), for the Monkland School Board, Coatbridge.

Crawley.—School, Mr. L. Thompson, County Council Buildings, Horsham.

Devonport.—Dispensary and alterations at infirmary: Mr. A. Gard, Clerk, Guardians' Offices, Devonport.

* See also our list of Competitions, Contracts, etc., on another page.

Dovercourt.—Garden city (50,000l.); Mr. F. G. V. Brown, architect, Dovercourt.

Dumbarion.—Alterations and additions to slaughterhouse (1,300l.); Mr. J. Briggs, Surveyor, Burgh Hall, Dumbarion.

Edinburgh.—Picture house: Mr. Thomas Stewart, 150, Lauriston place.

Failsworth.—Proposed baths, Wrigley Head (3,000l.); Mr. George F. Gray, Surveyor, Urban District Council Offices, Failsworth.

Faversham.—Extensions to Baptist church (850l.); Messrs. Ratcliff Brothers, builders, 16, West-street, Faversham.

Gainsborough.—Four shops, Church-street: Mr. S. W. Parker, Surveyor, Urban District Council Offices, Gainsborough.

Glasgow.—Improvements of several congested areas; Mr. A. B. McDonald, Surveyor, Burgh Hall, Glasgow.

Harcombe (near Chudleigh).—Residence, laundry block, garage, etc.; Mr. J. A. Lucas, architect, Guildhall-chambers, High street, Exeter; Messrs. Woodman & Sons, builders, Bartholomew-street East, Exeter.

Hornsea (Hull).—Reconstructing public rooms (1,000l.); Messrs. W. E. Walker & Sons, architects, Hull; Mr. C. M. Stephenson, builder, Hornsea.

Hull.—Vicarage, Albert-avenue (1,550l.); Messrs. W. S. Walker & Sons, architects, 77, Longgate.

Kingstown (Ireland).—Baths and washhouses (1,000l.); Mr. F. Weaver, builder, 72, Glashale road, Kingstown.

Kirkcubbin.—Drill hall for the Dumfries Territorial Association (1,000l.); Mr. James Young, builder, Sanquhar.

Leagrave.—School (3,379l.); Mr. O. P. Drever, builder, 69, Round-hill-road, Kettering.

Lyme Regis.—Eight houses, Lower Early Mead Field; Mr. F. H. McDonnell, Surveyor, Town Hall, Lyme Regis.

Malden.—Extensions at new county buildings (1,000l.); Mr. H. P. Maybury, Surveyor, West Borough-chambers, Malden.

Matlock.—Pavilion in Matlock Park (4,000l.); Mr. J. Turner, Architect, Town Hall, Matlock.

Milnbridge.—Additions to St. Michael's Church, Scar-lane; Mr. A. Shaw, architect, Golcar.

Montgomeryshire.—Forty houses; Mr. T. Alwyn Lloyd, architect, London.

Northfleet.—Extensions to gas producer house for M.P. Messrs. Henley's Telegraph Work Company, Ltd.

Norwich.—Hotel, Bethel-street, for the Y.M.C.A.; Messrs. E. Boardman & Sons, architects, Queen-street, Norwich.

Oldham.—Hospital and extensions to Strinsdale and Westhulme hospitals; Mr. E. C. Foote, Surveyor, Town Hall, Oldham.

Paxton.—School; Mr. F. W. Crook, Secretary Kent Education Committee, Caxton House, Westminster, S.W.

Pentrecwytch.—Congregational chapel: Messrs. Thomas Mcager & Jones, architects, Swansea; Messrs. Thomas & Jones, builders, State street, Morriston.

Pershore.—Proposed cottage homes (1,000l.); Mr. A. E. Baker, Clerk, Guardians' Offices, Pershore.

Perrin.—House, Wilson-street, Craigie; Mr. Andrew Gowans, builder, Perth.

Rishton. Workmen's dwellings; Mr. John Parker, architect, 106, High street, Rishton.

Saddleworth (Yorks).—Proposed fifty-five houses (16,000l.); Mr. J. H. Reynolds, Surveyor, Urban District Council Offices, Saddleworth.

Scotstown.—Twenty-three houses for the Scotstown Estate and Building Company; hall, Station-road, Scotstown West, for Messrs. Henderson & McDonald.

Seaham Harbour.—Fifty-three houses: Mr. J. Burrell, Surveyor, Urban District Council Offices, Seaham Harbour.

Sedburgh.—Pavilion; Messrs. Hicks & Charleswood, architects, 67, Westgate-road, Newcastle.

Sharrow.—Improvements at St. Andrew's Church (1,200l.); Mr. W. H. Wood, ecclesiastical architect, Newcastle.

Sheffield.—Sunday school (1,650l.); Trustees of the Fifth Park United Methodist Church.

Southport.—Lodge (650l.); Messrs. Fairbridge & Hatch, builders, 9a, Aughton-road, Birkdale, Southport.

Spalding.—Drill hall; Messrs. Scorer & Gamble, architects, Bank street-chambers, Lincoln.

Sparsholt.—Proposed farm school: Mr. D. T. Cowans, Hants County Council Offices, Winchester.

Stafford.—Post-office: Mr. H. Smith, builder, Wolverley, Kidderminster.

Stamford.—School; Mr. H. Donaldson, County Hall, Grantham.

Stockport.—Extensions and alterations to police buildings (15,000l.); Mr. J. Atkinson, Surveyor, Town Hall, Stockport.

Stretford.—Plans have been followed:—Seven houses, Darley-street, Fred Thorpe; extensions to the Trafford Wharf, for the Co-operative Society, Ltd.

Sunderland.—Day training cottages to Bede Collegiate School (places). Mr. F. G. Taylor, Builder, Town Hall, Sunderland.

Swansea.—Isolation block at (300l.); Messrs. Humphreys, Ltd., Knightsbridge, S.W. Business premises place: Mr. H. C. Portman, 6, Fisher-street, Swansea. Messrs. Brothers, builders, Heathfield-yard.

Wallsend.—School (12,000l.); Mr. builder, Morpeth.

Ware.—Enlargement of laundry house (2,800l.); Clerk, Guards Ware.

West Cornforth.—Theatre for Gray, proprietor of the New Electric Cooche.

West Hartlepool.—School; Mr. J. Clerk, Town Hall, West Hartlepool, to be appointed by competition. Electric power-station (480l.); Messrs. Son, builders, Burn-road, V pool.

Whitefield.—School (800 places) Little, architect, Ribblesdale-place.

Whitley.—Cemetery building (4, W. Allison, builder, Southchurch Auckland.

Wirral.—Proposed alterations to and extensions at infirmary (2,400l.); Messrs. Wirral.

Wolstanton.—School; Mr. S. H. Basford, Stoke-on-Trent.

Wolverhampton.—Buildings, Cattle Market (700l.); Mr. G. Green, Town Hall, Wolverhampton.

Workshop.—Re-erection of Margu, Inn; Messrs. Vallance & Westwick, Mansfield; Messrs. Vallance & Bly, Duke-street, Mansfield.

York.—Recovering home (1,988l.); Messrs. Guardians' Offices, York.

Youghal Dwellings.—Messrs. C. & Levis, architects, Youghal.

AN ANTI-TUBERCULOUS EXHIBITION.

IN view of the recommendation of the Committee on Tuberculosis, a special exhibition has been organized by the Society of Medical Officers of Health, headquarters, No. 1, Upper Mount-Russell-square, London, W.C. It is a comprehensive one, the exhibits ranging from the building materials to the epidemiology and phylomonometers. Shelters undergoing open-air treatment are three patterns are exhibited, two being coated with an antiseptic liquid, do not, in the present day, appear to be lodgings of the kind calculated to raise drooping spirits; they are undeniably well ventilated, having, in addition to a louvre, constructed chiefly of venetian blind, third is enamel painted in white and mounted on a turntable so that it may be varied with the weather; about it a suggestion of cheerfulness should think an important factor in a cure. All these shelters are of low prices, so that their destruction is not a great loss to the community.

Cooking appliances suitable for use are exhibited, and a special feature of the Zurich system of house-to-house refuse collecting. This is a scheme of the use of special covered wagons "sanitary dustbins," so arranged that rubbish after it has once been put into is not again subject to being dislodged every gust of wind. When full, inverted on the roof of the wagon, forward, the one movement opening covers of both bin and wagon and refuse to fall from the one into the other. Pulling the empty bin back again, two covers. Provision for the disposal of the rubbish is made by constructing the wagon as a series of flaps, which would resist the muscular but the type of dustman in vogue in the country, though they are said to work well in those of those trained under conscription by the Continental towns in which the system is adopted.

WESTONS," BEMBRIDGE, ISLE OF WIGHT.

se is situated in the Swain's-road, and is planned so that the rooms are on the garden front, the east, overlooking Selsey Bill. The walls are built hollow of local stone covered with white rough-cast. The roof is covered with red sand-faced half-round ridging tiles. The front and back are brought down to large verandahs, supported on pine posts and framings. The internally are quite simple, the hall being panelled with deal filled in with green canvas, and the rooms with Oregon pine timbers, from the saw and stained a dark-ir. The main staircase is of Oregon plain square newels, carried up supported by beams and simple brackets. The chief rooms have mantels specially designed by the architect, A. Jessop Hardwick, F.R.I.B.A., on-Thames. In addition to the plan shown by the accompanying are four large bedrooms, a bath and cupboards, with space in the for enlargements. Messrs. Love & Bembridge, were the general contractors. Messrs. Humphrey Jackson, & Co. supplying the special fittings.

Front View, "Westons," Bembridge, Isle of Wight.

Mr. A. Jessop Hardwick, F.R.I.B.A., Architect.

MEDIAEVAL MASON.

in the Middle Ages was commonly as a mason simply. Where, however, a number of masons were employed as in the accounts of mediaeval they were divided into various groups in the wages ledger being

ns," Bembridge, Isle of Wight.

essop Hardwick, F.R.I.B.A., Architect.

ter a distinctive heading. We see of a number of masons set down under heading "Fremasyns," another group heading "Setters," and others under "Row-masons," "Entailers," "yers," and "Hard-Hewers." The meaning of the term freemason is not the setters we may believe to have by whom the stone was set or laid cut and trimmed. In one account-builders' expenses (Record Office MS. 474-12) the setters are referred "tars of stone." We are not able to meaning of the term "lodgmen"; tion, so far as we are aware, occurs of accounts alone. The "hard-hewer" bly be by whom the stone was cut ed ready for the setter. "Row-may be a term for rough-mason. Dictionary defines rough-mason as one only with unhewn stone."

ct kind of work done by the "Row-m is not clear. His position apparently ly inferior to that of the freemason, 499-19 the former are paid 6d. a the latter 3s. 4d. a week. The MS. tioned relates perhaps rather more "ow-mason" than is commonly met e is not frequently referred to at all documents. From this particular e we learn that the "Row-mason"

worked on chimneys and on the floors of large ovens. There is, however, no reason to suppose that his work differed materially from that of an ordinary mason. In this important MS. we find a record of the employment of two different sets of "Row-masons" at the same time. The one group consisted of individuals who were paid by the day; the other group worked and were paid by the piece. These pieceworkers were known as "taskers"—that is, task-workers, men who worked by the task. The taskers were paid so much at a time in instalments, which was the manner usually adopted for the payment of men working by the piece. Richard Lewis, one of these masons and a tasker, was, we find, paid 10s. "in parte of payment for hys task work."

In MS. 479-11 the masons appearing under the names of "rough-layers" and "row-layers" were probably "Row-masons." In MS. 477-12 a large number of names of rough-layers appear. Of these the chief warden received 10d. a day, the warden 8d., and the remainder 7d. and 6d.; apprentices were paid 5d. and 6d. In the building of New College, Oxford (MS. 479-11),

the warden of the rough-layers had 7d. and the others 6d. a day. Where a large number of masons were employed a foreman, known as the "warden," was generally engaged.

In a large volume containing a record of the expenses connected with the erection of an important building in 1539 (Rec. Off. MS. 477-12) we see that the warden of the masons received 4s. a week, the setters 3s. 8d., and the lodgemen 3s. 4d.

In MS. 479-26 is an entry recording the wages paid to a mason and stating that food and drink were found by the mason himself: "Item payed to William Carter, mason, for his labor vi. days, with mete and drynke att his owne charges the same weke, at viid. the day, iiii. viid."

In MS. 479-11 more than one master mason was employed, each having xliid. a day. "The varden, masons, and scetters" each had 8s. 8d. a week, and every freemason 3s. 4d. This was for work done at Wolsey's New College at Oxford in the time of Henry VIII. The hard-hewers are referred to in MSS. 479-9 and 11 as having been paid 3s. 4d. a week. The mason's

Mr. A. Jessop Hardwick, F.R.I.B.A., Architect.

of the Act, "Lines of building by sect. 31, is not to affect the special statutory powers of railway or railway purposes."

relates to "naming and numbering and is outside the points we are at but Part V. "Open spaces about height of buildings," contains a provision for railway companies in the only sections which could apply to, sects. 47 and 49, relating to buildings.

tion under Parts VI and VII. is curious. By sect. 201 (8), "any structure situate upon the railway or station premises, and used for purposes of or in connexion with a railway company," is exempt from the operation of Parts VI and VII. respectively to "Construction of and "Special and temporary buildings or structures"; but in addition a general exemption, sect. 86 exempts the operation of Part VII. "Structures erected or set up upon the premises of any railway company," and "any structure situate upon the premises of a railway company." The remainder of the Act we need not consider, as with matters not relevant to our and we can now refer to the duties of Surveyors.

provides that, "Subject to the provisions of this Act, and to the exemptions mentioned, every building or and every work done to, in, or building or structure, and all matters the width and direction of streets, the line of building in streets, the open spaces about buildings, and of buildings, shall be subject to the discretion of the district surveyors. . . . it will be observed, fall within the of the Act above alluded to and the exemptions of railway companies are considered.

and VII. of the Act are those on every occasion inspection, as they construction of buildings and to structures, and from these two exemption for railway companies is the same as under the other Parts, 20, extending, as it does, to building premises used in connexion with the office.

class of exemption is more comprehensive considerations of the special referred upon the companies by of Parliament.

ing on this latter class of exemption found noted in the *Builder*, 1908 (London County Council v. Coal and Railway Society, Ltd.). The London and Railway Company had leased the land within of deviation to the Coal Company, option to resume immediate possession had been erected beyond the line. One of the Judges of a Court held that the Railway Company had exercised special legislative powers, and were, therefore, not exempted from the provisions of the Act; a second Judge Companies Act to prohibit building the building line; whilst the third of that the land was being used for purposes, and that the London Building restricted the restriction enforced by the Act. This case will illustrate the problems involved by this class on.

point to be borne in mind appears in the case of "construction of the exemption from Part VI, is provided the building is on railway and is used for the purpose of or in with the traffic of the railway

which the Finance Act came into operation), increment value duty should only date from the day of the purchase. It was pointed out that as no increment duty was payable between the two dates the vendor had to pay no duty, but the purchaser, if he resold the property at the same figure he gave for it, might yet be called upon to pay increment that had accrued due while the property was still the vendor's. The Chancellor of the Exchequer admitted that a case had been shown for an amendment of the law; indeed, he said the amendment to the Act proposed did not go far enough, as the case had to be considered where a contract had been entered into before the commencement of the Act.

An unforeseen difficulty has arisen, however, in carrying into effect an amendment which is called for to do away with a manifest injustice, as the Chancellor said the amendment could only be inserted in the Bill if it did not take the Bill out of the Parliament Act by converting the Bill into other than a money Bill. This question is still in abeyance, pending decision by the Speaker.

A motion abolishing increment on minus values was not carried, but it was stated that the Scotch decision, which we noted April 26 last, and which held such a practice to be an absurdity, is being carried to the House of Lords.

LONDON COUNCILS.

East Ham.—Dr. W. Benton, Medical Officer of Health for the Borough, in his annual Report for 1911, which has just been issued, states that the Borough is well supplied with houses and tenements, and that there is still a large number of houses being built. Plans were submitted and passed for the erection of buildings, comprising:—439 single tenement houses, forty-seven double tenement houses, fourteen shops and dwellings, one lock-up shop, two picture palaces, one school, twenty-three additions and alterations, etc. to business premises, and eleven additions and alterations, etc., to private houses. A regular system of house-to-house inspection has been carried out in the Borough, and a number of defects remedied. The very important work of inspecting choked drains has received much time and attention. There are 26,860 houses in the Borough, and at 2,359 the drains have been unstoppered and cleansed, which is equal to 8.7 per cent. of the houses, as compared with 9.7 per cent. for the previous year. These figures at first glance appear large, but it is to be remembered that the houses are drained by the combined system, six or more houses running into a common drain, intercepted from the sewer by a siphon. A thoughtless, or careless, act of an occupier would cause the whole of the houses connected to the common drain to be choked. At 613 houses the drains have been tested either with water, smoke, or chemicals, and at 262 houses the drains were discovered to be defective. In 507 instances, as compared with 310 for the previous year, notices have been served calling upon owners to abate nuisances caused by defective roofs, eaves, gutters, and rain-water pipes.

Damage and dilapidations are frequently the result of neglecting what is sometimes considered minor sanitary defects, but it is a great mistake to suppose that these necessary adjuncts to a dwelling-house can be disregarded. A defective rain-water pipe will cause dampness, discomfort, and probably injury to health. On 537 occasions it has been necessary to call attention to defective and insufficient underfloor ventilation, damp walls, and defective, or want of damp-course. Of this number, 401 relate to insufficient underfloor ventilation. It is to be regretted, Mr. Benton thinks, that architects and builders do not provide for a thorough current of air to pass under the floors of houses. If more attention was given to this when the house was under construction much trouble caused by dampness would be prevented. Dampness in dwelling-houses is certainly too prevalent in the Borough, especially in houses built prior to the East Ham Improvement Act, 1903, which gives power to the Council to regulate the level of the ground floor of new buildings intended for human habitation. This Act is consistently put into operation, and is of great advantage to the district, although it may cost the builder a few more pounds for construction. Notices have been served during the year to abate nuisances caused by dilapidated yards or forecourts in 941 instances. The importance of having the yard of a dwelling-house paved cannot be over-estimated, both in the interest of health and cleanliness. If the ground adjacent to the brickwork is paved with an impervious pavement, it will prevent dampness, and will help considerably to keep the interior floors clean.

Greenwich.—Dr. E. G. Annis, Medical Officer of Health for the Borough of Greenwich, in his annual Report for the past year, draws attention to police-court proceedings, which were instituted in connexion with works carried out at the London County Council Deptford Pumping Station. These proceedings, Dr. Annis states, were, after much correspondence between the respective officers and the Committees concerned, finally withdrawn on assurance being given by the Chairman of the Public Health Committee of the London County Council that in future, when any sanitary work was being carried out by that authority, they would give the Greenwich Council notice respecting the carrying out of such work, and would deposit the necessary plans of drainage in connexion therewith. The facts upon which these proceedings were initiated throws, he says, a very curious light on the attitude of the County Council in respect to sanitary works carried out by them, for they erected buildings not complying with the requirements of the London Building Act with regard to structure, not complying with the by-laws of the London County Council with regard to sanitary fittings, and, in fact, in some respects, being definitely contrary to the accepted present-day standards as regards sanitary arrangements, and, further, not complying with their own by-laws with respect to the giving of the necessary notices, and the deposit of plans; and, as indicated above, although the summonses have been withdrawn on promise of good behaviour in the future, yet the building in question still stands as it was erected.

In another part of the Report the Medical Officer states that the Housing and Town Planning Act, 1909, had been carefully considered, and, as a result, that portion of the Borough lying between the River Thames and the main road throughout the district, i.e., Woolwich, Trafalgar, and Greenwich roads, together with the continuation of Eastney-street on the south side of the main road, and in the West Ward, the rectangular plot enclosed by Lewisham-road, John Penn-street, the River Ravensbourne, and Albion-hill, and in the South Ward, the somewhat rectangular plot enclosed by Blackheath-hill, Maidstone-hill, Point-hill, Blissett-street, and South-street, had been delineated as the district for the special inspections required under the Act.

Hford.—Plans have been passed for Messrs. Rawlin, Culver, & Co. for five houses in Charbury-gardens; also for Mr. A. T. Haines for five houses in Vicarage-lane.

Islington.—Dr. A. E. Harris, Medical Officer of Health for the Borough, in his annual Report for 1911, just issued, states that builders, who were for the most part of the speculative class, in their desire to build as much as they could on a given piece of land, erected houses with basements, which, in older buildings, were almost, if not entirely, below the level of the street. This answered very well so long as there was no servant difficulty, but as it increased, so did basements become unpopular, and there was an increased demand for non-basement houses which could not be fully met in Islington. In the newer districts very attractive houses have been largely built in the Queen Anne style, but without the Queen Anne solidity. They have nice artistic exteriors, but the rooms are sometimes dark, the French windows are not suitable for this country, and, owing to the door-like method of opening, do not afford sufficient ventilation to the rooms. Their panes of glass, divided by many bars, admit the minimum of light, while they require the maximum of labour to clean; and the fanlights, many of which do not open, are for the most part glazed with coloured glass, so that near the ceilings efficient ventilation and light are not afforded where they are most requisite. Builders will find out by-and-by that people will discover, as already many have, that large windows with sliding sashes are the only efficient means of providing those two great necessities of life—good light and ventilation, without draughts, to keep the air sweet and pure; and that the sliding sashes also afford far better means for regulating the supply of air than is furnished by the windows of these picturesque houses, which are better adapted for warm climates where the people live with open windows nearly all the year round. In England, however, except in some very sheltered spots, they are not suitable.

Tottenham.—At a recent meeting of the Joint Hospital Board plans submitted by the Architect, Mr. A. J. Hardwick, for works to be carried out at the isolation hospital, were approved, and tenders are to be invited for carrying out the work, which is estimated to cost over 300l.

Tottenham.—According to Dr. S. Seokings, Acting Medical Officer of Health, the number of houses and shops and houses actually erected during the past year was 150.

LONDON COUNCILS—continued on page 270.

BUILDING—Continued.

ten at the commencement of each the latest date when the tender, or those willing to submit tenders,

3. **Hull.**—**JETTY.**—The Humber Board invite tenders for the renewal in ferro-concrete of the jetty in buoy shed on the east side of the Hull. Specifications and forms of offer, Alfred W. Franklin, Secretary, Buildings, Hull.

4. **Cairo.**—**PAVILIONS.**—Tenders for the Chief of the Administrative Works Ministry, Cairo, for the three new pavilions to Khanka (in Qalubia). Specification, plan, and quantities at the office of the Service, Public Works Ministry, Bury St. Edmunds.

5. **Crosshills.**—**BUILDING.**—Erection of the new house at Crosshills, near Skipton, architect, Skipton.

6. **Derlington.**—**STABLES.**—For extension at Harrogate, architect, Skipton.

7. **Golar.**—**HOUSE.**—Erection of a house at Golar, architect, Skipton.

8. **Hallifax.**—**PICTURE HOUSE.**—For a picture house at Ward-end, Halifax, architect and surveyor, George

9. **Hereford.**—**ALTERATIONS.**—For alterations to the Art School, Castle Street, Hereford, architect, Shire Hall.

10. **Law.**—**HALL.**—For proposed new hall at Law, 8th Battalion, H.L.I., 84, to Messrs. Trill & Stewart, Law.

11. **Liverpool.**—**MORTUARY.**—For the mortuary at the Workhouse, Brown Street, Liverpool, architect, Haigh, 2, Exchange-street East, Liverpool.

12. **Newcastle.**—**SCHOOL.**—The Council of Newcastle, Newcastle, invite tenders for a new agricultural school, W. H. Knowles, F.S.A., architect, Newcastle, Newcastle. Quantities on file.

13. **Pontefract.**—**HALL.**—For alterations, Market-place, Pontefract, for Messrs. J. H. Griffiths, architects, Pontefract, and Messrs. Pennington, architects, Pontefract.

14. **Purston.**—**RESIDENCE.**—For the residence at Purston, near Foston, architect, J. Tennant, architect and surveyor, Purston.

15. **Rypon.**—**HIPPODROME.**—For the Hippodrome, Rypon, measuring about 84 ft. long, and consisting of wood framing, iron and steel, including iron, steel, and fittings. Particulars tender from Mr. R. S. Griffiths, architect, Rypon.

16. **Walsby.**—**HOUSE.**—Erection of a house in Walsby, for the Yorkshire Coal Owners' Association, Edmondson, M.S.A., architect, 71, Walsby.

17. **Worthing.**—**PIER EXTENSION.**—For the extension of the pier, including erection of piles, steel girders, beams, bracing, and other works. Drawings and quantities from the Messrs. J. Mansergh & Sons, 5, Westminster, on deposit of 5l.

18. **London.**—**MACHINE.**—For 250 men's shirt capacity washing machine, Brook-street, Kennington, description of the machine, with drawings, from Mr. J. L. Goldstein, (Guardians' Boardroom) Brook-street, Kennington-road, London.

19. **Ardsley.**—**BRIDGE.**—For the new Mill Bridge, over the River Ardsley, specification, quantities, and drawings, from Mr. J. E. Riding Surveyor, County Hall, Ardsley.

20. **September 5.**—**Felixstowe.**—**ACCUMULATORS.**—For extensions to accumulators and balancer booster. Specifications, with general conditions and form of tender, at the Town Hall, Felixstowe. Deposit of 1l. 1s.

21. **September 9.**—**Cardiff.**—**STEELWORK.**—The Directors of the South Wales Portland Cement and Lime Company, Ltd., invite tenders for the constructional steelwork required in the extension of their works at Lower Penarth, near Cardiff. Plans seen, and specification and quantities from Mr. John W. Rodger, architect, 14, High-street, Cardiff.

22. **September 10.**—**Mexico.**—**WHARF.**—Tenders are invited by the Ministry of Communications and Public Works for the reconstruction of the Custom House Wharf at Alcala, State of Sinaloa. Plans and specifications at the "Oficina de Partes de la Secretaría de Comunicaciones y Obras Publicas," Mexico City. Deposit of 100 dollars (about 10l.).

23. **September 14.**—**Middleton.**—**WELL.**—For sinking a well and erecting a pump in Lisgoold. Mr. John Stanton, Clerk to the Council, Boardroom, Middleton Workhouse.

24. **September 24.**—**Lanark.**—**BRIDGES.**—Reconstruction of two bridges, carrying the Steel Company of Scotland's Branch Railway over the new highway at Newton station. Specification and quantities from Mr. Robert Spittal, Road Surveyor, District Offices, Hamilton.

25. **October 1.**—**Melbourne.**—**DREDGE.**—For the construction and delivery of a twin-screw sand suction hopper dredge of 1,200 tons capacity. Deposit, 200l. Plans, specifications, and conditions of the Agent General for Victoria, Melbourne-place, Strand, London.

26. **October 9.**—**Bradford.**—**SEWER.**—For the construction of a circular outfall sewer in tunnel from Fringhall to Strangford, 10 ft. in diameter and 4,800 yds. in length, with two shafts, 9 ft. diameter, 85 yds. and 104 yds. deep, with observatories, object pillars, etc. Drawings seen, and specification, conditions of contract, quantities, and form of tender from Mr. James Watson, M.Inst.C.E., Waterworks Engineer, Town Hall, Bradford, or of Mr. Joseph Garfield, Assoc. M.Inst.C.E., Sewage Works Engineer, Escholt Hall, near Shipley. Deposit of 5l. 6s.

FURNITURE, PAINTING, MATERIALS, etc.

27. **August 31.**—**Blaby.**—**PAINTING.**—For the painting, whitewashing, and cleaning of kitchen, dining-house, and laundry block and other rooms, etc. Particulars from Mr. B. A. Shires, Clerk, 1, Friar-lane, Leicester.

50. **September 9.**—**Skipton.**—**ROAD.**—For the construction of a 15-ft. roadway on the hilltop, the Fifth Recreation-ground, Skipton. Particulars from Mr. Aldridge, the Council's Engineer, Town Hall, Skipton.

51. **September 10.**—**Bedford.**—**GRANITE.**—For the supply of about 2,800 tons of broken granite, 2,870 tons of ironstone slag, and 1,600 tons of ironstone slag for macadam for road-making. Forms of tender and particulars from Mr. N. Greenfield, A.M.Inst.C.E., Borough Engineer and Surveyor, Town Hall, Bedford.

52. **September 10.**—**Belfast.**—**SPECIALS.**—For the laying and jointing of about 110 lin. yds. of 30-in. and 1,100 lin. yds. of 48-in. steel pipes and specials, and other works. Specification seen, and quantities and form of tender from the City Surveyor on deposit of 1l. 1s.

53. **September 10.**—**Leatherhead.**—**MATERIALS.**—For the supply of materials. Specifications and forms of tender from Mr. Sidney R. Drake, Surveyor, Council Offices, Leatherhead.

54. **September 11.**—**Garshalt.**—**ROAD.**—For works of road-making, paving, surface, drainage, etc., at Stanley Park-road. Plans, sections, and specification by Surveyor, Mr. W. Willis Gale, A.M.Inst.C.E. Quantities and particulars, on deposit of 1l., from Mr. C. P. Lovelock, Clerk, District Council Offices, The Square, Garshalt.

55. **September 11.**—**Strood.**—**WATER SUPPLY.**—For laying of about 200 lin. yds. of 8-in. cast iron water pipes in the grounds at the Council's Location Hospital, Whitehill-road, near Gravesend. Specification of works with Mr. J. E. Povey, Clerk to the Council, Union Offices, Strood, Kent.

56. **September 12.**—**Fishguard.**—**ROAD.**—For the construction of 833 lin. yds. of roadway, together with retaining and parapet walls, wire fences, surface-water drains, etc., at Dinas-hill, Fishguard. Plans and specification, conditions of contract, and form of contract seen, and quantities, with form of tender, at the Shire Hall, Havardweston, on deposit of 5l. 3s.

57. **September 12.**—**Gosport.**—**MATERIALS.**—For the supply of the following materials, etc.:—Artificial paving stone; broken stone for macadamizing; castings of cast-iron, stone, gravel and sand, etc.; kerb, channel, and setts; stoneware drain pipes. Specifications, forms of

ROADS, etc.—continued.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

Tender, etc., from the Surveyor to the Council, Town Hall, Gosport.

SEPTEMBER 12.—**Hounslow.**—PAVING.—For relaying the wood block paving in High-street, Hounslow from the junction of Bath and Staines roads to the White Bear Public-house, Hounslow. Plans seen, and specification, quantities, and form of tender from Mr. J. G. Carey, A.M.I.C.E., Engineer and Surveyor to the Council, on deposit of 2l. 2s.

SEPTEMBER 14.—**Fen Ditton.**—SEWAGE.—For the construction of about 500 yds. of 9-in. sewer, with manholes, etc., in Ditton-lane. Plans at the Surveyor's Office, Brunswick House, Cambridge. Deposit of 5l.

SEPTEMBER 17.—**Acton.**—ROADS.—For making-up Montague-gardens and Oakley-avenue, and resurfacing roads with tar-macadam. Forms of tender from the Surveyor, Council Offices, Winchester-street, Acton, W.

SEPTEMBER 23.—**Frodsham.**—STREETS.—For the making of Volunteer-street and Sandfields. Plans, specifications, and quantities with Mr. Henry Swetenham, 49, Northgate-street, Chester, the Council's Surveyor. Deposit of 10s. 6d.

SEPTEMBER 23.—**Weston.**—STREET.—The making of Clark's-terrace and lane and certain back passages (see sets) at Weston Point. Plans, and quantities with Mr. Frank J. chambers, Runcorn, the Council's deposit of 10s. 6d.

SEPTEMBER 30.—**Cairo.**—SANITARY.—Tenders will be received at the office of the Administrative Service, Ministry, Cairo, for the sanitary at the three new pavilions at Lunatic Asylum (Gallubia). Specifications and estimate at the office of the Administrative Service, Public Works, Cairo.

Auction Sale.

Nature and Place of Sale.	By whom Offered.
*BUILDING MATERIALS, NORWOOD—On the Site	Verward & Yates

LONDON COUNCILS—continued from page 267.

as against 199 for the previous year. Buildings of other descriptions number sixty-four, as compared with sixty-seven in 1910. The number of additions and alterations made to existing buildings was forty-one, as contrasted with forty-nine in 1910. Plans estimated cost of 397 new buildings during the year, as compared with 312 during last year. New streets and extensions of existing streets numbered five (as against fourteen in 1910), and their total length was 2,375 ft., as contrasted with a total length of 6,715 ft. for 1910: 190 ft. of new 9-in. soil sewers, and 78 ft. of 15-in., and 475 ft. of 9-in. surface water sewers have been laid under the supervision of the Building Department. On the London County Council Estate certificates have been granted for fifty-one houses completed during the year; thirty-two others are in the course of construction.

FOREIGN AND COLONIAL.

Building, etc., Canada.

The University of Toronto will erect a new building for a gymnasium, dining hall, reading and billiard rooms, etc., at an estimated cost of 1,150,000 dollars (about 256,000l.). The name and address of the architect may be obtained by British manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 75, Basinghall street, London, E.C.

Reinforced Concrete and Metal Work, Bulgaria.

With reference to the notice on p. 496 of the *Board of Trade Journal* of June 6 relative to a call for tenders by the Bulgarian Directorate-General of Railways and Ports for the supply of reinforced concrete and metal work for warehouse sheds at Varna and Bourgas, at an upset price of 195,000 francs (7,800l.), the *Official Messenger* (Sofia) of August 14 notices that, none of the tenders received having been accepted, a further adjudication under modified conditions will be held. Offers, accompanied by certificates of competency, will be received up to 5 p.m. on September 2 at the "Bureau des Finances, Graf Ignatieff 12," Sofia. Copies of the form of tender, with revised specifications, drawings, and conditions, may be obtained from the "Direction Générale des Chemins de Fer et des Ports de l'Elat Bulgare," Sofia, on payment of 10 francs (8s.) per set. Local representation is necessary. A list of agents established in Sofia may be obtained by British firms on application to the Commercial Intelligence Branch of the Board of Trade, 75, Basinghall-street, London, E.C.

PATENTS.

APPLICATIONS PUBLISHED.*

17,549 of 1911.—James Garvie: Apparatus for making concrete pipes *in situ*.

17,720 of 1911.—John Croft Smith: Windows, doors, and the like.

21,469 of 1911.—Richard Wilson: Joint for wooden eaves, spouts, or gutters, and the like.

21,697 of 1911.—John Gustav Adolf Rhodin: Manufacture of cement.

23,010 of 1911.—George Gordon Brodie and James Daniel Prior: Cooking ranges.

23,205 of 1911.—Titus Searson Robert William Anderson: Method of and means for insulating walls, ceilings, decks, bulkheads, or the like, against the conduction of heat.

*All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

23,488 of 1911.—Ioich Nakahara: Electric door operators.

23,391 of 1911.—Rudolf Herman Lange and Walter Charles Knebelkamp: Door-holders.

955 of 1912.—Lucien Adenot: Draught-excluders for doors and the like.

2,802 of 1912.—S. M. Wilmot & Co., and Samuel Mullett Wilmot: Construction of gates for field, estate, and general purposes.

4,322 of 1912.—Edward Hottot and Claude Hamilton Harris: Automatic apparatus for opening greenhouse windows, skylights, fanlights, and other hinged sashes.

8,200 of 1912.—Henry Imrie (Arthur Pack-scher): Glazed frames.

8,404 of 1912.—Wilhelm Liegener: Walls and the like.

SELECTED PATENTS.

8,619 of 1911.—Johannes Fock, jun.: Lazy-longs scaffolding.

This relates to lazy-longs scaffolding, which is mounted on a wheeled carriage and is raised by chains *a* wound on a ratchet drum *k*, and is provided with platforms *d* and ladders *e*, hinged to the under sides of the

8,619 of 1911.

upper platforms. The top platform carries a winch and is provided with handrails *f*. The lazy-longs are maintained in the extended position by a pawl engaging the ratchet drum, and by clamps *n* engaging in holes *m* in the levers of the lazy-longs. The structure is adjusted to be horizontal by screwed spindles *b*.

8,884 of 1911.—Adolf Muller-Deuschmann: Glazing.

This relates to glazing-bars for window frames which are formed of wooden laths *a*

8,884 of 1911.

with sheaths of metal *b*, the ends of which are lapped to form flanges *c* to support the glass panes. The corners of the frames are formed

of separate corner pieces of structure.

9,147 of 1911.—Percy Edgar Builders' cradles.

This relates to builders' cradles, suspended by ropes *f* from beams, which are constructed sections 6 and side sections 7, 8, and the central sections and connect to move simultaneously in or out

9,147 of 1911.

ends of the sections are connected by passing over pulleys carried by tackle 2, and over guide-pulleys *h* on the floor of the central section. They are guided on the central section 17, 18, carried by the side section respectively.

9,382 of 1911.—James Henry George Richard Leadson: Or lights and casements.

This relates to fanlights or casements which are opened and closed by a rod, one end of which is pivoted to a sliding member 7 sliding in a slotted tube

9,382 of 1911.

the other end to a member 17 bracket 18 on the fanlight, to which 17 is also pivoted an arm 10a, the end of which works in a fixed slot in the frame. The arm 8 is formed with a cam work against a fixed pin 21, so that on the closing movement the arm 8 is pivoted against the frame. The operation is operated by cords 24, the tube 5 and passing over pulleys 25.

9,768 of 1911.—William Henman Beasley Heap: Domestic hearths.

This relates to hearths consisting of trimmer tiles, bricks, or blocks transversely to the length of the hearth supported at their two ends by a wall respectively, the tiles and formed with notches in the ends to engage a fillet secured to the transverse support. The tile has a V-shaped notch *b* at each end, and is supported upon a ledge *c* formed by the brick

PERSONALITY AND ARCHITECTURE.

EDUCATION has, like architecture, suffered from the attempt to apply it by rule, too much from without, as a kind of ornament. That architecture is *decori urbium*, a familiar motto puts before that aim, and it is through knowledge the citizens and their ways that to embellish the city.

Increasing attention given to education now-a-days from many points of view, and in its correspondence with architecture, is bringing into clearer light the city, both as starting-point and primarily it has to lead out the attributes and mental constitution of the pupil—what he is, in fact—may instruct, develop, and make efficient to the growth of character—what he has the power to become. Personality, as to its identity, must be granted; a man can only use his faculties, but it is in his power to use them, or to misuse, abuse, or neglect them. It seems strange that only now becoming evident that good, that it may even amount to a duty to try to instruct, to build up the knowledge which he has not the power to assimilate, to try to train that do not exist.

The tremendous change that has been going on during the last

150 years the old and present methods of education are seen to be inadequate. One result of that change has been that in the far greater subdivision and specialisation of work, in the springing up of new occupations, new types of personality have arisen, and others, like the architect's, now require training to a higher pitch of efficiency and comprehensiveness. In the growth of the social organism towards truer co-ordination the need of the right man in the right place becomes more apparent. Correspondingly the individual difficulty of choosing a calling becomes more insistent.

The necessity of getting men of the right mental qualities and constitution in the architectural profession is the more felt now that its education is being brought up to modern requirements. Many, of course, are from an early age sufficiently self-conscious of their own powers and desires to self-determine their own calling. But there are many others—we would say a considerable majority—who are not, and some of these drift into architecture from various indefinite traits, such as a taste for drawing, a tendency to art, and the like.

We are not aware of any statement by any professional or educational body as to type of personality, particular mental constitution, or special aptitudes necessary in those who would become

architects. The only qualification asked for as a rule is a good general education, which is vague as a test of fitness, as the usual routine process may mean much to one personality, little or nothing to another. The result is, we fear, that the term general may often be taken in the sense of the Scottish professor, who, when asked what he meant by good "generally" applied to a certain student, said "Not particularly."

The process of selection or weeding-out is left till professional education has advanced a stage or two, and, though more feasible in the better system and opportunities now prevailing, so experimental a method obviously presents serious disadvantages for many students. Earlier selection is desirable, natural selection, if possible, through the student's own knowledge of his possibilities and desires; but at all events some way of testing, at the very outset, whether an aspirant has essential characteristics fitting him for architectural training and practice. We do not think it beyond the scope of general education to make this possible in most cases at school-leaving age. On the contrary, it is just in those early years that care should be taken to give the special individual characteristics, that constitute personality, opportunity to show themselves and develop.

The question is, then, what can be done now to this end, and what more under improved but still possible conditions? We hear much of the greater complication and responsibility and the more exacting nature of an architect's calling to-day as compared with earlier periods. But, though this may imply the necessity of a far wider, a more comprehensive and exact education, a more varied efficiency, the broad attributes of personality are the same for the complete architect to-day as in the days of Wren, Brunelleschi, or of Iktinos and Calliocrates.

His position is that of leader of a body of co-operating mechanics, craftsmen, artists, and various functionaries whose operations he has to direct, control, and manage to one end. He is the organiser, co-ordinator, arranger, the planner who must be able to scheme and contrive as constructor. So far he would be a good builder—or other things—and architecture must be good building, but also something better. So that further he must have initiative and invention, the originating and creative impulse and energy of the able designer. He must have the intuitive sense of fitness, keen perception of beauty, imagination free to range over things known and beyond them. He must have the artist's power to communicate and impress his conceptions upon others, his capacity of hand and eye, to make concretely visible the thought his mind can visualise. Again, he must have the judicial power, the intuitive insight and quick decision necessary in the arbitrator, the assessor of "values," and the critic, and something of the evident personality that impresses and carries weight as adviser, supervisor, and leader.

Capacity for art, of course, he must have, but, it is well to remember, the quite kindred capacity for practical science also. He stands, in fact, at the synthesis of art and science. In the old popular division of useful and fine arts he stands midway, and intimately related to both, between those who "make" for practical uses and those whose making is more directly for spiritual ends. His must be the healthful and virile feeling of art for life's sake, the perpetual office of which is to educate in the perception of the beauty which everywhere in the realm of nature and of man is coincident with truth and fitness to some purpose.

In attempting to state broadly the personal attributes essential for the making of the complete architect we must bear in mind both the unity and universality of personality. Though for convenience we enumerate separately the functions or categories of functions, we must realise they do not exist as separate powers of the mind, but as a synthetic unity defying analysis. In their infinite possibilities of combination and interaction, and with other attributes as important but more general, arises the infinite variety of individualities and possibilities of specialisation. But architectural education aims at the production, not of the trained specialist, but of the fully-instructed and efficient architect; and its growth is showing that such a finished product involves the starting with the right raw material. It

is a true application of the principle that "*Poëta nascitur, non fit.*" The poet is essentially the "maker." So is the architect. His buildings, like the poet's verses, must not only, to use Emerson's phrase, "rhyme well," not only be true in construction and to some purpose, but must express in their own peculiar way some underlying thought of beauty.

We have no ready-made scheme by which these right men are to be discovered. If a board of practising architects could be formed—men of marked and varied individuality and experience—before whom every aspirant would have to state personally why he proposed to become an architect, and give some evidence of natural qualifications therefore, something more might be done than by any examination testing his standard of general education.

The defects of this proposal are, however, under present conditions, sufficiently obvious. If Registration come, the subject will have to be considered, and possibly some such test as this, already used elsewhere, may be thought out.

But, after all, this only affects one part of the problem. By advice and discouragement it may tend to the elimination of the unfit, but hardly to the discovery and encouragement of the fit. For that we must look to a process of natural selection; how to bring that more freely into action is the real question.

We have alluded to the complementary difficulty in choice of occupation. So many youths leave school—some even, be it whispered, the Universities—without definite consciousness of their own possibilities, or concrete knowledge of the present actual work of the world. Having passed through a certain routine, they have acquired perhaps the necessary foundation or instruments of learning; they may have attained various, sometimes high, proficiency and culture, classical, mathematical, scientific. It is a sufficient starting-point for some, but in a majority personality is yet more or less latent, has not been sufficiently brought into contact with the facts and actualities outside to awaken it to full sense of its particular sympathies and potentialities in relation thereto.

Thought tends to the concrete rather than the abstract, especially in the young. We know that insatiable questioning faculty, beginning almost with speech. In former articles we have made some reference to an incipient educational movement, aiming by more objective teaching to build up that natural practical interest in immediate environment, and lead on, with developing capacity, to all the phenomena of civilisation in their complex co-ordination. The tracing of occupations and industry, for instance, from earliest beginnings to the present in their correlation with each other and with activities of local government, teaching, art, and the rest, gives a vital interest to geography and history that appeals to the young mind, tending to rouse and differentiate its sympathies and desires.

We mention this movement again here to point its suggestiveness towards the

natural selection we look for; also as the inception of a system will retain all that is good in classical and modern methods, harmony instead of contrast, that character is only fully developed the efficiency of the particular of each personality. This, of course, is matter of general but not less, therefore, of professional interest. Architects are interested in seeing the "good general education" for their purpose; for unless that education be right it is of no good to the superstructure. They must remain passive. Of all citizens as professors of the great organic constructive art, have an appointment in raising in human society a not made with hands, of which buildings in brick and stone have made the symbols.

ST. GEORGE'S HALL AGAIN.

WE publish in this issue from Mr. Hastwell, the President of the Architectural Society, an endeavouring to induce the Corporation to consider a sketch of providing a suitable place for the statue of statutory at either end of the street. Considering that the whole *raison d'être* of the act of vandalism contemplated was to prepare a position for the late King's statue, it appears to be most reasonable that such a request should meet with response. There appears, however, to be in the actions of the Corporation over this matter some of the eagerness which characterises the action of a girl who, having to make a marriage from which friends would dissuade her, meets objections by hastening the event, and so renders protest useless.

As Mr. Grayson points out, the proposal is dual in its character, the objects aimed at in the Corporation scheme are unfortunate and ill-considered. Nothing perhaps in architectural planning needs more careful consideration than that of an external stair in conjunction with a main building of the importance of George's Hall such a scheme is the most careful adjustment and the new stairway will lead "nowhere in particular to the vestibule behind the Judge's chair is no adequate space at the top which the flight starts, nor is there a practical possibility of forming a great hall.

Thus the proposal has neither artistic value to recommend it nor by the means of such trivial details with the adjuncts of a great building which have been condemned is practically the unanimous opinion of the leading architectural societies. The Liverpool Corporation intends its spirit of independence and contempt of competent advice.

We are afraid it is now too late to expect a change in the official

more act of successful vandalism recorded.

It would be an interesting study to show how far the sense of inheritance in the past has been a part of the life of any nation or age.

At the very point to the action of the authorities in rebuilding the city of S. Mark's as an example of the past, but we are afraid the remains do not appeal to the average Italian as an asset for making a living in the city than in any other light. The lights turned her face away from the glorious traditions of her art to copy crudely, and the less inspired examples of the past in Europe. In mediæval Europe the ruins of one century often destroyed the work of their forefathers, but they did not usually something to give in

the can (if such a time is to come) to face the great works of the past (the recent past) by work of intrinsic merit, and even then necessity demands it, we are dishonest stewards, wasting the inheritance which does not belong

to us still seek for the key which will give the sympathies of the average man enable him to feel with us in the past, to leave a history written on the life of our generation, and this feeling will come a sense of the work of our fathers. The few of the few is, as it is too common in the face of rampant

NOTES.

We heartily welcome the new issue of the Local Government Board circular, No. 285, calling attention to the necessity for a periodical revision of the laws relating to new streets and by-laws, in view of the new methods of construction and the trials introduced since some of the laws were framed. By-laws were intended to curtail, but to securing good building, and the lack of common knowledge that often failed in their intention, has been the cause of considerable and annoyance to all concerned in the operations. We are glad to see, therefore, that portion of the Bill commenting on some of the defects in rural districts which will lead to the building of proper cottages by reason of their very provisions, and we hope that the Bill will lead to the speedy revision of the existing by-laws.

It will be a healthy sign of progress in the applied arts when producers begin to show the practical interest in the art schools expressed in the letter of the "Editor" to the *Times* of the 10th. In the stimulus to revived interest between education, art, and that would result therefrom, the reintegration of the aims and

interests of the artist and art teacher on the one hand and of the producer and the public on the other, there could not but be reactions beneficial to art and its restoration to its rightful office as the interpretation of use and purpose in terms of beauty, and the joyous and efficient expression of character and ideal. Only in such restoration will it again be seen by all as the fully healthy condition of living and working, and rise out of the clouds of anæmic or hypocritical cant and sentimentality that too often separate it at present from sane and virile activities. In this we see one of the ways mentioned in our "Note" upon "National Art Training" a fortnight ago, by which industry will eventually free itself from its slavery to capricious and arbitrary fashion. Following "Manufacturer's" letter, and complementing and emphasising it by the juxtaposition, is one, signed by "Artist," calling attention to the same difficulty, which is dealt with mainly from the point of view of architecture in our leading article to-day—the difficulty, namely, of selecting only such students for training as are qualified by natural fitness for an art career. "Artist" incidentally comments upon the delusiveness of the copying faculty as a promise of art, and in this also there is food for much serious reflection with regard to architecture and architectural education and practice to-day.

Condition of Holborn Viaduct.

THE defects which have been for some time past evident in the twelve granite columns supporting the main span of Holborn Viaduct are beginning to assume a serious character. The shafts of the columns are, in plan, hexagons of about 2 ft. 6 in. side, the faces being so hollowed as to make the shape resemble a group of six large keel mouldings, and each consists of a shaft of polished red granite, monolithic save for a bed stone about a foot high and a necking stone of somewhat less than a foot. They stand upon moulded bases and high plinths. Trouble arose some time ago from the fact, we believe, that the bed joints are made with sheets of lead, the tendency of which to spread laterally under pressure tore asunder some of the bed stones. It is probable that these injuries would have been more pronounced but for the fact that the bed stones, unlike the main shafts, have each a vertical joint at the centre. For some time there has also been evident a tendency of some of the stones to shift upon their beds, which is probably due to movements of the iron arch ribs carrying the roadway, and it must contribute to the causes inducing unforeseen stresses in the shafts. This shifting of the stones is most pronounced in the eastern range of columns, in nearly all of which the large monolith has shifted westwards upon its bed, while the necking stone shows a still further displacement in the same direction. In the western range there is much less of this movement, but where it occurs it seems to be towards the east. The most serious features, however, are the considerable number and the general distribution of the cracks now in evidence. Recent inspection from the footway, under conditions which made it impossible to

assert that no defects were overlooked, showed that ten of the twelve bed-stones are broken, and three, at least, of the necking-stones, while the main stones themselves are in four or five cases cracked or otherwise injured. It is to be feared that the very great increase in the weight of and vibration caused by present-day motor traffic is responsible for the trouble, and, if this be so, those charged with the maintenance of the structure will, before long, have to take serious steps to secure its safety.

Women as Architects.

THE alleged suitability of women as architects is again under discussion in the daily Press, as the result of what is called "Lady Osborne Morgan's criticism of male architects" in the course of the inaugural ceremony of the Arts and Crafts Exhibition in connexion with the National Eisteddfod at Wrexham. Lady Osborne Morgan, in congratulating the promoters on the success of the exhibition, is reported to have said, referring to the designs for workmen's cottages in the competition promoted by the Welsh Housing Association*: "The profession of architecture offers strong inducements to women. The knowledge and experience of the home should enable women to make it a profitable as well as a useful profession, for, with all due deference to the lords of creation, I do not think male architects quite understand the construction of a larder." Probably these remarks were not made seriously, but a point of the criticism, implying that the construction of a house consists in the designing of larders, is being endorsed by writers in the daily Press. A well-known provincial journal, at all events, commenting on these remarks, appears to think that in the great majority of the houses put up as the habitations of the lower middle class the needs of women receive strikingly inadequate consideration: "Houses rented at from twenty-four to thirty pounds a year have no cupboards worth talking about," implying, of course, that the male architect is at fault, whereas no architect has anything to do with the great majority of these buildings. It is true that the real author of these structures—the speculative builder—is mentioned later on, but the writer's confusion in facts is shown when he says: "Garden cities in various parts of the country are showing that conditions can be improved with no greater demands on space or funds. . . . Possibly our architects of Suburbia will follow the example. . . . The existing state of things might easily be improved by women architects, presuming that they had domestic knowledge and experience on which to base their designs." We need scarcely point out that conditions have improved in garden cities because of the increasing employment of architects, and we doubt whether women architects, even with domestic knowledge and experience, would be able to improve on the existing state of things, though we might welcome the substitution of the woman architect for our old friend the jerry-builder.

* See "Civic Review" this week, p. 283.

S. Maria in Campitelli, Rome.

BAROQUE ARCHITECTURE: II. ROMAN POPES AND CHURCHES.

"In the year 1443, when Eugenius IV. returned to Rome, the city was become a mere dwelling of herdsmen; her inhabitants were in no way distinguished from the peasants and shepherds of the surrounding country. The hills had been long abandoned, and the dwellings were gathered together in the levels along the windings of the Tiber; no pavements were found in the narrow streets, and these were darkened by projecting balconies and by the buttresses that served to prop one house against another. Cattle wandered about as in a village. From San Silvestro to the Porta del Popolo all was garden and marsh, the resort of wild ducks. The very memory of antiquity was fast sinking; the Capitol had become 'the hill of goats,' the Forum Romanum was 'the cows' field.' To the few monuments yet remaining the people attached the most absurd legends. The church of St. Peter was on the point of falling to pieces."

Such was the state of Rome in early Renaissance days, as described by the great German historian of the Popes, at the time when Florence, Genoa, Venice, and many other smaller States were in the highest prosperity.

And when we remember that eighty years after this date Rome was sacked by a ruthless mercenary army we may place the beginnings of modern Rome in the XVIth century.

It would be idle to pretend that the Baroque period found Rome in quite so sad a condition as the lines quoted above imply, for the fifty years that intervened between the sack of 1527 and the end of the Renaissance proper were busy years for architects. Peruzzi, Sangallo, and Michelangelo were hard at work paving the way for the extraordinary period of building activity which was to follow. The population, which was no more than 50,000 in 1555, doubled in the ensuing twenty years.

The Papal power, fiercely assailed, as we have seen, by reformers both within and without its walls, awoke to defend itself

hotly against the movement which became its undoing, and with its success the new Rome, but renewed strength and waking life from sleep, rushed into all the bold colossal, and often vainglorious of Baroque architecture.

Without positively affirming that Rome was the only birthplace of Baroque architecture, some would say that it sprang in other places simultaneously varying causes—none could deny that Rome it first became of great importance to the world.

With even greater certainty it can be laid down that the period was the time of Papal supremacy, so that Rome of the time was no more and no less than Baroque.

It is true that a saying of Montaigne was in Rome, that he considered the three most beautiful things in the world were the Gesh church, and that and his daughter—the other two cannot be included in that category from that date onwards, at any rate, for the Popes built below doubt to the period in question churches and their palaces, their fountains, their villas and their gardens.

How much this style in Rome Papacy we may infer from a close study of history.

To Sixtus V. is usually assigned the remodelling of Rome. Another Pope, he had climbed to the top of St. Peter from a menial position as a herdboy. His object in life was to glorify God by the city where the head of his Church resided, and to keep the world well informed of his own share in the glory thereof. He poured into Rome of Christendom poured into Rome insufficient for the Papal need, and debt began to accumulate as the more magnificent every day.

The spirit in which Sixtus V. carried out his great projects is typical of the Baroque period. The stately days of Queen Elizabeth I. were marked in Rome by more than one triumph of the Church over the heresy of the present and the past.

Take, for instance, an event which cannot be regarded as epoch-making in consequences, the removal of the obelisk a short distance from its position to its present site in the Piazza di S. Pietro. It was a difficult matter, and there is no harm in the fact that the 900 men (a preposterous number, one thinks) by hearing Mass, confessing, and receiving the Sacrament. But let us read the story.

"When all was ready the signal was given by sound of trumpet."

And when the obelisk was hoisted on its base by windlasses:—

"A salute was fired from the guns of S. Angelo. All the bells of the city pealed forth."

Several months later, when the obelisk had settled in, the work was begun:—

"The day chosen by Sixtus V. for the undertaking was September 12, 1586 (which he had at first intended to be a fortunate day), immediately preceding the feast of the Elevation of the Cross, to which the obelisk was to be dedicated. The Pope again commenced their labour, and himself, mending themselves to God, and their knees as they entered the Piazza."

An hour before sunset the work was effected:—

"The exulting cries of the people filled the air, and the satisfaction of the Pope was complete. This work, which

decessors had desired to perform, so many writers had roomed he had not accomplished. He his diary that he has achieved difficult enterprise conceivable of man. He struck medals in ration of this event, received congratulation in every language, official announcements of his foreign powers.

from this extract, quoted here propose, how great a change had the world since the days of so short a time before. Then for art's sake rather than to God or man. Now architects blazing publicity and fawning exalt the Church and her wealthy

the XVIIth century the Popes ormously rich, an important factor hitecultural history. It is impos- y exactly what the amount of their e from their office, but, as they employ a mercenary army, they ed their energies on founding a d a fortune for their families. evonnes were chiefly drawn from roses. The fertile and prosperous

territory in Italy, greatly increased in the XVIth century, which formed the patrimony of St. Peter, was taxed to its utmost capacity and beyond it. The contributions of the faithful throughout the world were augmented by persuasion and coercion long past the point of being voluntary. Lastly, as a final resource, vast quantities of sinecure offices were established in Rome, and whole "colleges" whose members paid subscriptions for nominal privileges and titles drawing a sort of life annuity.

Yet in spite of all these sources of wealth the income of the Popes, which was largely devoted to their buildings, was insufficient to meet the enormous demands made upon it, and so we see the beginnings laid of an immense debt. We must, therefore, bear in mind that, although the great achievements of the Baroque period are due to the XVIIIth-century Popes, we cannot credit them with having provided all the necessary funds. This was an unwelcome legacy to their successors.

The debt, which in 1587 may be computed at 1,900,000*l.* in our money, had risen in forty years to 4,500,000*l.*; and Sixtus V., among other economies, reduced his table expenses to 3*s.* a day to cope with it.

On the other hand, we find the Popes "putting by" vast sums of money for their families. The Borghese acquired eighty estates in the Campagna, and are said to have received in sixteen years the equivalent of 250,000*l.* in money and offices. The Aldobrandini were equally fortunate, but the Barberini far surpassed both. Their income from the Papacy is estimated at 166,000*l.* per annum, and we are told on good authority that the incredible sum of 26,000,000*l.* passed into their hands during their pontificate.

These figures make one realise easily the origin of these great palaces in the centre of Rome, and those luxurious villas on its outskirts which bear the names of the papal families. For to everyone who knows Rome what names are more familiar than those of the Aldobrandini, the Borghese, and the Ludovisi, the Barberini and the Chigi, the Odescalchi and the Albani—all of them families whose fortunes were made by the XVIIIth-century Popes?

Their official dwellings, too, the Vatican and Lateran palaces, much of the Quirinal also, owe almost all their splendour and

wealth to this period. Bernini's *Scala Regia* in the Vatican may have been built out of extortionate taxation, or its cost may have been added to the vast debt of the Popes, but it is all part and parcel of a time of magnificent display, the time when Modern Rome was made.

Their genuine zeal for the Church led them into many bold enterprises, and the XVIIIth-century churches of Rome may literally be reckoned by the hundred. They range from vast buildings, such as St. John Lateran and the Gesù, down to tiny chapels and oratories. Yet among the churches we may infer that the worst acts of vandalism were committed, for these modern champions of Christendom had small veneration for Christendom of the distant past.

Lastly must be mentioned those buildings of the Popes which represent their sense of public spirit and civic pride in the glory of Rome, buildings which ensured for them an almost constant popularity in the city despite their extravagance. For their mercenary habits in the Papal States were matched by their prodigality in Rome. From two and twenty miles away in the hills Sixtus V. brought a fine supply of water into the city, desiring to produce a work "whose magnificence might compete with the glories of Ancient Rome." Cost and difficulties alike were nothing to him; to think imperially was his aim.

Paul V., who emulated him in the splendour of his schemes, built an even more lengthy aqueduct, and the water which gushes forth from his bombastic Acqua Paolina is borne 35 miles. To fully realise the part which the Popes played in Rome at this time we must add such great works as the Piazza di S. Pietro, the Piazza del Popolo, the "Spanish Steps" in the Piazza di Spagna, most of the fountains, and many of the features which we should class as a part of their "town planning."

It is not altogether exaggeration to say that XVIIIth-century building in Rome was restricted to the Popes and the Papal families.

Meanwhile, the city was settling down, and the official class, at first largely bachelor in character, was giving place to a population of families. From the middle of the XVIth century, when the Popes began to beautify and establish the city, Rome has slowly and steadily developed, and has maintained its position as the capital of the world.

In reviewing the Baroque churches of Rome only a few examples can be even mentioned from the countless number. Gurlitt, in his volume on the period in Italy, describes about a hundred, but these form only a proportion of the total.

We may first consider how the work of the Baroque architects affected the three greatest historic churches of Rome—St. Peter's, S. Giovanni in Laterano, and S. Maria Maggiore.

St. Peter's both lost and gained at the hands of those who followed Michelangelo. Up to his day only Bramante had played a really prominent part in its design, and the church as we now see it is largely due to Michelangelo's adoption or adaptation of Bramante's original ideas, combined and infused with his own genius. The dome we may consider entirely Michelangelo's creation as Giacomo della Porta and Domenico Fontana worked from his model after his death. Vignola designed the cupolas surrounding the central dome. These may or may not have been inspired by Michelangelo, but are certainly worthy of him, though the criticism has been made with some justification that they are perhaps out of scale with the central dome. We now find ourselves in the Baroque period and have to consider what Maderna, Bernini, and Borromini left for posterity in St. Peter's. "Maderna's contemptible façade," as it is usually known, was the result of Paul V.'s decision to make the plan of the church a Latin instead of a Greek cross, and so to have the façade at the end of a long nave

[Photo. by Mascioni.]

S. Agnese, Rome, with the Piazza Navona.

instead of being close to the dome. This front is decidedly weak in design. The intercolumniation is defective and the disposition of openings particularly unfortunate. Possibly Maderna felt the difficulty of working on Michelangelo's scale, possibly the idea of lengthening the church originated with his employer and not with him, but, at any rate, the worst point about this façade is its existence at all, blocking up, as it does, what ought to be the best view of the magnificent dome. There are other Baroque features in St. Peter's, bad and good. There is Bernini's strange, florid, yet not altogether unsuitable baldacchino, the colossal dimensions of which are hard to realise. There is Maderna's golden Confessio, another witness to Paul V.'s lust for display. But the last great addition to the glory of St. Peter's, made more than sixty years after Michelangelo's death, is worthy of unqualified and enthusiastic praise—Bernini's colonnaded piazza. Of this perfect setting to a building which exhibits the continuous trend of Italian architecture for 120 years, of other schemes for placing this great church as it should be placed, more will be said in the following chapter.

S. Giovanni in Laterano is at least as noteworthy historically as St. Peter's, and is officially the Mother Church of all the world, but its architecture is not commensurate with its importance. Leaving out of the question the remarkably interesting buildings which surround the church proper, and the extraordinarily hideous and garish extension of the choir in modern times, most of what we see is due to three Baroque architects. In the days of Sixtus V. (1586) Domenico Fontana built the Loggia and façade of the south transept and most of

the adjoining palace, in a style which is Baroque in detail, but severe in its general lines. Sixty-four years later Borromini's over-ornate but magnificent nave (marred by the bizarre niches on the piers) showed the change in taste, and lastly, Galileo's colossal west front, dwarfing everything else in the neighbourhood, displayed some of the strength and much of the weakness of the Baroque period.

In Santa Maria Maggiore, on the other hand, with an equally long range of building activity, we find the architecture at a high level throughout. The church loses nothing by its fine and carefully planned situation, isolated in a huge piazza, and forming the vista at the end of several long streets. Here, by reason of its glorious traditions, was a suitable place for Sixtus V. to dazzle the world by a display of costly marbles and beautiful architecture. His Capella del Presepio fulfilled both his wishes, and in 1611 Paul V., whose object was to emulate the achievements of Sixtus, built a chapel corresponding to the Presepio, and surpassing it in magnificence, if not in elegance. Between 1670 and 1676 Clement X. remodelled the whole of the east end and succeeded admirably. His work shows nothing florid or out of place, and is in perfect harmony with the papal chapels and with its surroundings. It is an excellent example of the Baroque style at its best, and of its especial fitness for monumental subjects. As late as 1743 the architect Fuga erected the striking west front, deeply recessed, bold, and recalling rather the style of the XVIIIth than his own century. Few churches in Rome satisfy architects as does S. Maria Maggiore.

Of those which were erected before 1600,

it may in general be said that a less mature character than that which we find at St. Peter's, and where they are good they are good. We may take as three examples the Gesu, S. Luigi dei Francesi, and S. Maria della Pace. The first of these, the church of the Jesuits, begun by Vignola in 1568; the second, the church of the French, begun by S. Filippo Neri, who died in 1593, and was consecrated in 1600; the third, the national church of the French, begun by Giacomo della Porta, the last by Lunghi's best work. These buildings are typical of the architecture of the Baroque era in Rome. We should add to the group the large and beautiful church of S. Andrea della Valle by Pietro Paolo Olivieri (1651) begun in 1594. The façade, by several years later, and in a florid style, but the body of the church closely resembles the Gesu, and still more so.

It is interesting to compare these two great churches which each other in one of the busiest city. At first sight they appear identical, even the number of nave being the same; but on close inspection it will be found that the advantage is with S. Andrea, where the arcade is proportion to its order than at the Gesu, in this case more successful, which above the arcade at the Gesu, sculpture and ornament, comparable with S. Andrea. However, the dome is wider and more impressive in the neighbouring church. Both interiors are magnificent, and adapted for preaching to a large congregation. An ample range of chapels in Della Porta's two façades—the S. Luigi—show the advent of Baroque recessing, and it is fortunate that Vignola's inferior design for the west front was not carried out. Yet they are an admitted Baroque weakness, the appearance of isolation from the rest of the church, the façade tending to be more and more a great stone screen, designs were carved rather than carved part of a church.

The XVIIIth-century churches have perhaps been more abused than others, and though some examples merit it, others have so many in their favour that the scale is balanced. One or two built in the century display but little extra in their design. Thus S. Ignazio, the architects Zampieri and Grassano, the years 1626 and 1675, has a severe interior with the usual crossing, and Maderna's S. Suzanna (1595-1603) has an objectionable feature, a sloping pediment above the pediment. This might be a heinous fault, but against it may be set the otherwise excellent design of the portions of the façade, well suited to the church which it terminates, and the decoration (which in no case is excessive) and the admirable fenestration. The façade of S. Ignazio, it may be said, is the work of Algardi.

The architect for whom all the typical Baroque churches in Rome are reserved is Francesco Borromini (1584-1667), and indeed he has thoroughly deserved his reputation. Just as Bernini sometimes seemed to give place to fancy (which one thinks he never possessed him in designing the interior at St. Peter's), so Borromini is given to the wildest and most extravagant manner. It would appear that all through the Baroque period two tendencies were found—a legitimate developing of lines, such as in S. Maria della Pace, S. Agnese, or S. Maria della Pace.

Some Typical Plans of Baroque Churches in Rome.

PROPOSED ALTERATION TO ST. GEORGE'S HALL, LIVERPOOL.

HASTWELL GRAYSON, President, Liver-
pool Architectural Society, Incorporated, has
in Tuesday's issue of the *Times* in
reference to the proposed alteration to St.
George's Hall, Liverpool, in the course of which
the City Council will on Wednesday
the proposed alteration of the southern
of St. George's Hall. The Finance
tee, with a pertinacity which we cannot
imagine, have persisted in obtaining
es for combining a southern approach
the Memorial to King Edward. Archi-
tural opinion has with extraordinary
ity opposed each of the official schemes,
to now the general public have merely
the scheme with a benevolent neutrality.
combined efforts of Elmes and Cockerell,
probably the City Surveyor, who was
ge of the works between 1847, when
died, and 1851, the date of Cockerell's
ment, succeeded in creating, in spite
steep incline to St. John's-lane, a finish
south end of the hall which has called
universal praise. No other building in
ish Isles, except St. Paul's and the

Houses of Parliament, is so widely known and
appreciated. The Finance Committee must
admit that the proposed flight of steps, with
its irregular commencement, extending 29 ft.
into the road, may spoil the existing harmonious
composition of podium and pediment. They
appear willing to take this risk, but it is for
the citizens of Liverpool to give or withhold
permission. I am asked by the Liverpool
Architectural Society to make this last appeal
to leave St. George's Hall as it is and to give up
the idea of a flight of steps leading from nowhere
in particular to a small vestibule behind the
Judge's chair. Such a flight logically requires
a fine open space at the foot designed to receive
it, and a direct internal approach to the Great
Hall, neither of which, even at enormous
expense, is feasible.

There is no need to have the Memorial near
the hall, as there are several equally prominent
positions in Liverpool. But if, however, the
public will have it at the south end of the hall,
it need not be made an excuse for a useless
and disfiguring flight of steps. A sketch by
Elmes preserved in the library of the Royal
Institute of British Architects shows at each
end of the podium a massive pedestal of
masonry, surmounted by an equestrian statue.
The Liverpool Architectural Society suggest
to the City Council that the proposal of the
Finance Committee should be referred back
in order that a model be prepared based on
this sketch of Elmes, and the Society reiterates
the views already expressed by the architects
of Great Britain, America, and Europe, that
the City Council have no moral right to attempt
unwarranted experiments to the famous
building of which they are the trustees.

[The subject is referred to in our second
article, p. 274. The Council have decided by
fifty-two votes to forty in favour of the scheme
for altering the south front.]

GENERAL NEWS.

Professional Announcements.

The address of Mr. T. Elson Hardy, architect
and surveyor, has been altered by the postal
authorities to 19, Broadway, Westminster,
S.W. His telephone number is Victoria 4784.
Mr. Stanley Towse is moving his office from
8, New-square, Lincoln's Inn, to 9, Newcomen-
street, London Bridge, and his telephone
number will be 12965 Central.

Appointments.

Mr. L. S. Carr has been appointed con-
structional engineer for the erection of the
electric power station at Nechells, Birmingham.
Mr. Carr, who is thirty-eight years of age,
received his training at Rutherford College,
Newcastle-on-Tyne.

The Secretary of the Royal Institute of
British Architects is requested to invite ap-
plications for an appointment at Hong Kong.
Candidates should be Associates of the Royal
Institute between twenty-five and thirty
years of age, experienced in steel construction
and with some knowledge of quantities. A
good salary is offered.

The South Indian Railway Company is pre-
pared to receive applications for the position
of architect upon their engineering staff in
India. Particulars may be obtained from the
Company's Consulting Engineer, Mr. Robert
White, 3, Victoria-street, London, S.W.

Fire Appliances for St. Paul's.

The Dean and Chapter of St. Paul's Cathedral
have decided to have the building equipped
with an efficient fire protection plant. Some
months ago the London Fire Brigade made
experiments, and subsequently Messrs. Merry-
weather & Sons, the fire appliance engineers,
were asked to submit a scheme for the better
protection of the Cathedral from fire. Their
plans were approved, and work has been in
progress, under the direction of the Cathedral
architect, Mr. Mervyn Macartney, F.R.I.B.A.
Under the new system it will be possible to
pour water on any part of the building, from
the crypt to the dome.

Crane Collapse in the City.

By the collapse of a crane on Monday in
Great St. Helen's, Bishopsgate, one man was
killed and six injured. The crane, which stood
on a platform and weighed about 5 tons,
snapped, it is stated, at the base while a scoop

of rubbish was being lifted from the foundations
of new offices in course of erection on the site
of the old Synagogue. It fell on a number of
men, and also dragged with it the driver, who
was scalded by water from the boiler and
suffered from shock and bruises.

Well-Boring in Aldwych.

Messrs. Duke & Ockenden, Ltd., are boring
for a well on the site of the Australian Govern-
ment buildings in Aldwych. The boring
will descend to a depth of 450 ft. down to the
chalk, passing through the surface gravels
and London clay, Reading and Woolwich beds,
and Thanet sands. Nearly forty wells have
been sunk upon private premises in London
during the past seventy-five years, the yield
of water being very good in respect of organic
purity, with an even temperature of about
53 deg. all the year round.

The Royal Photographic Society.

The annual exhibition of the Royal Photo-
graphic Society is being held this year at the
Galleries of the Royal Society of British Artists
in Suffolk-street, Pall Mall, from September 2
till September 21. There are between 800
and 700 exhibits by home, foreign, and colonial
workers, and the exhibition as usual is divided
into two main sections, the pictorial and the
scientific. Colour photography moves slowly
to the long-wished-for goal of prints in
natural colours upon paper. Two steps
in this direction have been made quite
recently, and prints are shown upon the walls.
The first method is shown in the pictorial
section, and is an evolution of the transfer
oil process invented by M. Robert Demachy,
of Paris. Briefly stated, an oil print is made
by well-known means on gelatinised paper, and
is transferred from that by means of a copper-
plate press to any suitable drawing or printing
paper. The new method consists in substi-
tuting colour pigments for monochrome inks,
and the prints closely resemble water-colour
sketches. Another series of prints show what
has been done recently in advancing colour
photography. These prints have been produced
by what is known to the expert photographer
as the transfer oil process, colour pigment being
substituted for the photographic monochrome
image.

London County Council Chief Engineer.

The London County Council are inviting
applications for the appointment of Chief
Engineer of the Council and County Surveyor
for the Administrative County of London. The
applicant appointed will be required to take up
his duties on January 1, 1913, and will not be
allowed to take any private business or any
other paid employment. The salary attaching
to the appointment is 2,000*l.* a year.

Rural Main Roads in Kent.

From the annual report of the County
Surveyor (Mr. H. P. Maybury) we learn that the
total expenditure upon the rural main roads
in Kent last year was 112,361*l.*, or 18,117*l.*
more than in the previous year. Of the
total amount 36,205*l.* was spent upon tar-
coating, widening, kerbing, channelling, paving,
and drainage works. The cost of coating
roads with tar amounted to 28,665*l.*, and an
additional sum of 5,103*l.* paid to urban
authorities for similar work within their areas
raised the total cost to the county to 33,768*l.*

The L.C.C. Central School.

With Mr. F. V. Burridge, R.E., as Principal,
the Central School of Arts and Crafts, South-
ampton-row, will reopen on September 23.
Mr. S. B. K. Caulfield, F.R.I.B.A., and Mr.
S. Woods Hill, A.R.I.B.A., are the instructors
in Architectural Design and Drawing, Mr.
F. A. Mansford will take the Building Con-
struction course, and Mr. P. J. Waldram,
F.S.I., will teach Structural Mechanics. The
Prospectus and Time Table for all classes is
now ready.

The Selborne Society and Antiquities.

The Selborne Society have appointed a
special section with the purpose of protecting
places and objects of antiquarian interest
or natural beauty, including ancient buildings,
earthworks, and similar historical relics,
together with weapons, coins, utensils, etc.,
of all periods. The antiquities section will,
it is expected, give their attention to the
contemplated excavations on the site of
Verulamium, and the preservation of Whitgift
Hospital, Croydon.

ILLUSTRATIONS.

Cathedral Church of St. Paul, Namirembe, Kampala, Uganda.

THE view of the interior corresponds with the geometrical drawings published in the *Builder* last year. The architectural treatment is based upon the large and simple brickwork method of Northern Italy, and is entirely devoid of ornament except in the four capitals of the central columns, which it is proposed should be of marble. The drawing was exhibited in the Royal Academy Exhibition this year.

Baroque Architecture.

Two of our plates this week are given in connexion with the second article (p. 276) of our series on "Baroque Architecture," the first of which appeared in our issue for August 16. The plates consist of: S. Carlo alle Quattro Fontane; S. Maria Della Pace; West Front, Santa Maria Maggiore; and Interior of the Church of the Gesù—all at Rome.

MEETING.

MONDAY, SEPTEMBER 9.

The Incorporated Clerks of Works' Association (Carpenters' Hall, London-west).—Paper by Mr. John Church (of the Cubitt Construction Company) on "Medusa Waterproofing Compound and White Portland Cement," 8 p.m.

COMPETITION NEWS.

A list of current Competitions is printed on page 291.

Scholarships in Art.

The Board of Education propose, if there are candidates of sufficient merit, to make the following awards in Art in 1913:—Ten Royal Exhibitions (60*l.* a year for three years and instruction in the Royal College of Art); six National Scholarships (60*l.* a year for three years and free admission to the Royal College of Art); not less than fifteen Free Scholarships, entitling each holder to tuition in the Schools of the Royal College of Art; and twenty-four Local Scholarships tenable at Schools of Art recognised by the Board, with allowances of 20*l.* a year each for three years. These awards will be made upon the results of the Board's examinations in Drawing, Painting, Modelling, Pictorial Design, and Industrial Design, or, in the case of candidates in Architecture, upon those of the Intermediate Examination of the Royal Institute of British Architects, to be held in June, 1913. The Regulations may be obtained from his Majesty's Stationery Office, price 1*d.*

The Australian Federal Capital.

The July issue of the *Journal of Proceedings* of the Royal Victorian Institute of Architects contains a breezy review of the Federal Capital Site Competition, the winning design in which (by Mr. W. B. Griffin) was illustrated in our issue of August 2. "Only about one-third of the designs submitted are on exhibition," writes the critic, "the remainder being considered unworthy of being shown. None of the competitors whose names have been made public have the least claim to be considered among the town-planning specialists of the world. The first prize design is without doubt the best submitted. We cannot congratulate the Government upon receiving a high-class collection of designs, and they richly deserve the blame for the fiasco they deliberately set about to make."

CORRESPONDENCE.

Trafalgar-square.

SIR,—As at Hyde Park-corner, the excess of roadway in Trafalgar-square adds to the dangers of the traffic, and takes from space which is so much needed for the pedestrian, while the narrowness of the pavement to the south of the Nelson Column gives rise to the most disagreeable feeling of want of space for so massive a structure. By an extension of the central pavement, the construction of a triangular-island pavement, and the consequent alteration in the roadways, as shown on the plan I send herewith.

a considerable addition could be made to the pavement area of the square, making possible a regulation of the road traffic, which would add greatly to safety and save much of the time which is lost owing to the medley of the present planning of the roads.

MARK H. JUDGE.

FIFTY YEARS AGO

From the *Builder* of September 6, 1863.

Cirencester Church.

THE inhabitants of Cirencester, public meeting on the 15th ult., Earl Bathurst presided, to resolve on their magnificent parish church, a vast fabric of the XVth and earlier centuries, and of that ornate character and construction which place it beyond means of local resources to do without required after the lapse of years many odd things which have been various times to spoil the architectural ecclesiastical arrangements of these edifices. Cirencester was one of the abbeys, and the church was gorgeous, are remnants of glass indicative of the colour that distinguished its numerous large windows. But these cannot be in what the parishioners restore, and would not suffice for that item.

The Princess's Theatre, Oxford-street.

SIR,—Although regular subscribers to your journal, by reason of the holiday season our attention has only just been attracted to the paragraph in your issue of the 16th ult. in reference to the Princess's Theatre, Oxford-street (which we have disposed of, together with the other properties and the site embodied in the Princess's Hotel scheme), wherein you state that the ground is nearly 21,500 ft. super.

As there is no doubt that you intend this to apply to the theatre only and a misconception might arise in many minds as to how an hotel costing 600,000*l.* could be erected on that space, we beg to inform you that the area covered by the hotel will be 52,300 sq. ft., which may be subsequently increased, as the area of the land taken from Lord Howard de Walden is over 1½ acres.

The architects engaged are Messrs. Boehmer & Gibbs, of 11, Spring-gardens, S.W., and building operations will shortly be commenced.

DAVIS & CO.

INTERCOMMUNICATION COLUMN.

Customary Travelling Expenses.

SIR,—Having been appointed architect for a building to be erected 120 miles distant from my office on the understanding that all customary travelling expenses will be paid by the clients, in addition to the usual commission, I shall be obliged if you will kindly say what "customary travelling expenses" includes. As a visit to the work involves a whole day, should any charge be made for time, in addition to travelling expenses, and if so, at what rate? I presume it is usual to charge first-class travelling expenses. Should "customary travelling expenses" include other out-of-pocket expenses, apart from actual travelling expenses?

T-SQUARE.

HOT WATER SUPPLY.

In the last paragraph of the "Ed." note after Mr. W. B. Hopkins' letter, on page 253, last week, the word "top" should be "tap."

PARISH CHURCH OF CHRISTCHURCH, COLEFORD.

The Parish Church of Christchurch, Coleford, erected in 1812, the first church to be erected in the Forest of Dean, is undergoing restoration at the hands of Mr. Ernest Davies, architect, of Hereford. The work consists of the removal of the old gallery, reseating the nave and north aisle with modern seating (to take the place of the high, straight-back pews), the erection of an oak screen under the chancel arch, and the building of a new vestry adjoining the west tower with castellated top, flat roof, and wood-block floors. The contract has been let to Messrs. Jones Brothers, builders, Bridewell, Coleford.

** Since the above was written, Cirencester Church has passed through vicissitudes, but it is still one of the parish churches in England, as it is traditionally one of the most beautiful to the Reformation it must have passed a most gorgeous interior; enough of the frescoes, stained glass, embroidery, and inscriptions to tell William Morris to say of it that it was "romantic to a degree." In the time of Laud's time steps were taken to repair the dilapidated and neglected state in which the fabric had fallen, and repairs in the manner of the day were carried out time to time afterwards, but it was not until 1865 that the work was taken up thoroughly, as foreshadowed by the extract. Sir Gilbert Scott was called in with this delicate operation, and he laid out some 13,000*l.* upon a restoration which was quite as vigorous as was the structure. The gem of the whole is the Trinity Chapel, which was the principal Guild of the town, a two-storied south porch facing the place is a feature for which Cirencester is especially well known. Built in the reign of Henry VIII., and displaying all the of vertical line and beauty of rich detail which the masons of that period were remarkable, it seems originally to have served as the meeting-place of the Guilds, of which there were at least ten at that time. The wealthy woolstaplers of the district watched over the needs of the church, and here, as in many another church, the merchants and princes of the cloth lavished their wealth upon their church as a thank-offering for their prosperity.—Ed.

"BAROQUE ARCHITECTURE," II

THE BUILDER, SEPTEMBER 6, 1912.

This is a detailed architectural drawing of a large, circular, domed structure, likely a dome or a large hall. The drawing is oriented vertically on the page. It features a central tower or dome with a smaller structure on top. The main body of the structure is circular with a series of smaller, semi-circular or polygonal sections along its perimeter. The drawing is highly detailed, showing structural elements like walls, windows, and internal divisions. The overall style is that of a technical or architectural sketch, with fine lines and shading to indicate depth and form.

MONTHLY REVIEW *of* CIVIC DESIGN.

Canadian Bank of Commerce, Vancouver.

Messrs. Darling & Pearson, Architects.

CANADIAN BANK.

an article on Montreal reference to the prominent position in commercial life of the community has been expressed by buildings of character was illustrated by Montreal branch of the Canadian Commerce, designed by Messrs. Darling & Pearson.

ing, situated at the principal port on the Eastern Coast, is matched by the same architects, at the northern port, Vancouver, the terminus of the Canadian Pacific Railway, which practically came into existence with the coming of the rail- road 45,000 inhabitants in 1905, and no doubt, to be one of the great Western Continent. This fact has increased the size and style of the bank, which is worthy of a city. It sets a standard of scale of design which, if followed by the future of Vancouver, will make of the finest as well as one of the future in Canada.

led us much satisfaction to have published these admirable designs by Darling & Pearson. Mr. Frank is a long and honourable career, a pioneer work, and influenced us throughout the length and breadth during a critical stage of its

development. We wish to take this opportunity to express our regret that the name of his firm was inadvertently omitted from the illustration we published last month of the Convocation Hall of the University of Toronto. We regret this omission the more as Messrs. Darling & Pearson's work deserves wider recognition than it has yet obtained in this country.

A SUGGESTED WHITEHALL IMPROVEMENT.

In our issue of June 7 we drew attention to the proposed new Government building in Whitehall, and suggested that the architectural problem might be considerably simplified by the creation of a new street, as shown in our illustration.

We have reason to believe that this suggestion has been carefully considered by those responsible, and that the frontage line to the Embankment has been altered from that originally intended, and shown on the plan sent to us by Mr. Howley Sim—published on July 5—to a line more in conformity with our sketch.

We understand, however, that there are supposed to be serious objections to the construction of any such new street as we suggested. It is thought that the light to the back of the United Service Institution and Gwydyr House would be interfered with, and that sufficient space would not be left between the new street and the Embankment to provide a site capable of accommodating the whole of the Board of Trade in one building.

We pointed out at the time that much of the space lost by the new street could be gained by projecting the building beyond the line of Whitehall Court on the Embankment side, as shown on our plan, in such a way as to suggest the continuation of the present frontage.

There may be, of course, more serious objections of which we are not aware, but we must say that those to which we have referred do not appear insuperable. The question of light to the present buildings is surely a matter of arrangement in detail—our plan was simply intended to explain the general idea—and the space necessary for the Board of Trade is largely a matter of compactness of plan and the skill with which the building is arranged.

But, after all, the idea for a street was only put forward as a suggestion for one way of dealing with the problem as a whole. There are other, and possibly better, ways. What concerns us most deeply is the necessity of treating the scheme as a whole, however it may be done; of considering the future development of the entire tract of land between Whitehall and the Embankment, and the futility of proceeding in the same piecemeal way that has been responsible for so many disasters in the past.

We may perhaps be permitted to express our surprise that a Government which has shown so much interest in the development of our cities as to pass the Town Planning Act should permit, or even perhaps constrain, one of its departments to deal with the sites for State buildings in such a manner as virtually appears

Proposed Estate Development, Huddersfield.

[The above illustration explains the nature of the Crescent Group designed by Mr. Edgar Wood, F.R.I.B.A., for the Birkey Estate, Huddersfield. The buildings would be carried out in local stone, cut face surface, with concrete and asphalt roofs. This group forms a portion of an estate in town-planning lines.]

to set the spirit, if not the letter, of the Act at defiance by proceeding as if it was not in existence.

Instead of being the first to set an example and to practise what it preaches, the Government seems to content itself with urging local authorities to deal with their improvements in a comprehensive manner, while all the time it is dealing with the improvements under its own control in the very heart of the capital city of the Empire in a piecemeal way that shows no regard for the amenities, for the needs of the future, or for the architectural possibilities of the situation.

We urge the advisability of preparing a scheme for the whole of this district which will provide sites for the additional Government buildings inevitably required in the future. We suggest that it will be to the advantage of the State if the most gifted of those who have been encouraged by the Town Planning Act to take up the study of this subject are given an opportunity to place their services at its disposal by means of a competition.

We can imagine nothing better calculated to excite public interest in the working of the Act than an announcement that the Government intend to carry out all State improvements in the same spirit, and we commend this point of view to the attention of the President of the Local Government Board.

CONTINENTAL TOWN-PLANNERS' VISIT TO ENGLAND.

A NUMBER of members of various Continental garden cities and town-planning associations have been visiting several garden cities in this country. The visitors were mainly from Germany, but the party included several Bohemians, Austrians, Danes, and Russians. Some are architects, some are lawyers, some are provincial mayors, some University professors, and in most cases they

are the official representatives of the towns or districts from which they come. In the course of their tour they visited Hull, York, Liverpool, Port Sunlight, Chester, Birmingham, Brentham (near Ealing), Hampstead, and Letchworth. At Ealing the president of the party, Dr. Bernhard Kampffmeyer, Herr Otto the secretary, Dr. Stahl, of Stuttgart, and other members gave a representative of the *Manchester Guardian* an outline of the present tour and some information as to the impressions they had received. They had noticed, on the whole, a great improvement in the general housing conditions, not only in the garden cities, but also in the old towns. England, they observed, had certainly awakened to the need of united action in the matter of housing.

"England has also made wonderful strides in town planning," said Herr Kampffmeyer. "We do not come to you to learn town planning; for that you come to us. Our town-planning laws are much older than yours, and our cities—even the old ones—have been built upon planned lines. Of course, some of our industrial cities and seaports are new, and they have grown so rapidly that in some cases they have formed slums. But we are overtaking them by degrees, and even in our worst industrial towns we have our slums well in hand. There will be no more, and we shall never have anything like the poorer quarters of Hull, York, or Liverpool. But we have still a good deal to learn from England in the matter of housing, especially as regards the garden cities. We, too, have garden cities. They are springing up in connexion with almost all our big towns on definitely planned lines. But they are mainly for the industrial population and are on the Bourneville or Port Sunlight model. Garden cities like Hampstead and Harborne, designed for all classes, we have not yet achieved."

Dr. Stahl, of Stuttgart, referred to the garden suburb adjoining that city, which

was begun by the workpeople on co-partnership lines. The Stuttgart dissatisfied with the housing of the city, formed an association and site before going to capitalists for aid to begin building, and the estate agreed, had thoroughly justified itself. "They were dissatisfied with the quality of the housing in the city," he said, "it was nothing like so bad as in towns I have seen. The reason was so bad with us is because our laws are much stricter. They are no longer, and they are not particularly obligatory. Even then the municipality go beyond them, and they do. It is a law that in semi-urban districts one-third of the land can be built over, may not be built higher than four floors. If a municipality likes to be built four floors high it may then only half the land may be built over. The rest must be used for roads, public open spaces."

"One result of these severe laws," said another member, "is that those depressing streets of hundred all exactly alike, which imply material for new slums. I saw in Baltimore and afterwards in the enormous block-dwellings, in which we are not well satisfied with the town districts, and we are the small-house system that is in England."

"At the same time," Herr Stahl said, "we in Stuttgart find we are especially under a co-partnership system people the kind of housing they do not want to live in, and we have no point in our building cottages do not want to tend gardens, and we try to force them. We find a number of persons of the type who prefer 'flat life,' and we have

The question of definite regulations will no doubt be considered by the Competitions Committee at their earliest opportunity, as the frequency of these competitions proves the question to be urgent.

Pending the evolution of the perfect town-planner who will combine in one personality every aspect of this many-sided subject, it appears to us imperative that an architect with special knowledge of the question should be concerned in the assessing of such competitions. Such an arrangement would perhaps lead to a general acceptance of the jury system which, as we have frequently pointed out, is, in our opinion, generally the most satisfactory one for competitions of every description.

THE "TOWN PLANNING REVIEW."

The *Town Planning Review* for July is a valuable number which has a special interest for us, as, in addition to a notice of our recent competition for the Regent's Quadrant, in which the award of our Assessors is upheld, it contains an historical article on the origin and growth of Regent-street, profusely illustrated by photographs showing the salient features still remaining, such as Waterloo-place and other parts before the present demolition was begun. Reproductions appear of old views, showing the colonnades in the Quadrant, St. George's and St. Philip's Chapels, and parts of both the east and west sides of the street as originally designed; also four views of recent buildings showing the street under process of modernisation. The plan by Nash, dated 1814, differs in some respects from that actually carried out.

The article touches upon the condition of London at this period and upon the scheme for the lay-out of Marylebone Park—now Regent's Park—which is really part of the same general scheme for the development of this district; it throws an interesting light on the methods of the speculators of the period and on the general financial arrangements involved. It also gives information as to the other architects engaged on original designs for buildings in Regent-street, such as Soane, Smirke, Burton, and Cockerell, and finally deals with the alterations made since 1828, from Pennethorne's destruction of the colonnade and the rebuilding of the Harmonic Institute down to the erection of the Piccadilly Hotel and the new Polytechnic. This article will, we imagine, have permanent value as placing on record the salient facts in a most interesting episode in the later development of London.

In a short Editorial note on the present situation the opinion is expressed that, although it may be too late to consider the question of widening, it is not too late to limit the height of future buildings, and we certainly agree that this should be done. A suggestion is also made that, if painted stucco cannot be permitted, the use of Pentelicon marble, instead of Portland stone, might ensure those qualities of cleanliness, lightness, and durability which are desirable in a street of this character.

A short article by Professor Adshead on Burton's arch at Hyde Park-corner presents the opportunity to make a most interesting comparison between Burton's original idea—as illustrated by the drawing he presented to the Institute—and the work as now finally completed by the addition of the quadriga recently erected. Whatever the merits of this quadriga may be, it is to be regretted that the scale and proportions of the original design could not be maintained.

The Editor, Mr. Patrick Abercrombie, contributes the first part of what promises to be a complete study of the development of Brussels, illustrated by maps and by numerous views. The article is wide in its scope, and treats of the political and social development of the Belgian peoples, and refers to the European events which influenced the history of Flanders and Brabant, so throwing a light on the history of Brussels. The Napoleonic régime is particularly interesting, and the account of the manner in which the organic growth of the city has been retarded for political reasons points a moral which should be continually borne in mind. We shall look forward to the second part of this article with much interest.

The series of articles by Professor Adshead on "The Decoration and Furnishing of the City" is continued by a further article on "Fountains." This like the previous articles, is very well illustrated by some charming examples. It is a pity, however, that so many of the views do not show more of the

surroundings—some of them do not even permit us to realise the complete design of the fountains themselves—whereas it is surely the placing of the fountains and their relation to their environment which is even more important than their features and detail. The series of "Features of English Towns" is continued by No. 3, "The Porter Brook and Valley, Sheffield," by Mr. A. H. Holland; No. 4, "The Market Place, St. Albans," by Mr. A. E. Richardson; and No. 5, "Church Row, Hampstead," by Mr. T. Alwyn Lloyd.

"Sheffield under the Town Planning Act, prefaced by an Historical Note," is another careful and comprehensive study by Mr. Abercrombie which should be invaluable to all those who have to deal with problems of a similar character.

"The Many-Tentacled Town" deals with the work of Emile Verhaeren, the poet of modern Flanders, who, says Mr. Abercrombie, "might be called the poet of town planning; the same state of affairs which drove Mr. Booth and Mr. Rowntree to write their *Surveys of Poverty*, which suggested to Mr. Howard's mind the ideal of a garden city, and produced our Housing and Town Planning Act of 1909, inspired him to sing." "The power of great ideas, fearlessly advocated in order to lead the energies of the city into the right channel; this is Verhaeren's contention, and it explains the fascination which the modern city has for him, for he realises that all the energy is there—it only lacks direction."

Reviews of New Books and Magazines and a Chronicle of Passing Events complete a number which adds to the high reputation of the *Town Planning Review*.

CIVIC DESIGN NOTES.

Cottage Famine Scandal.

ANOTHER example of the lack of cottage accommodation, and of the difficulty of building cottages in conformity with the by-laws at rents in proportion to a labourer's wages, is afforded by the compulsory closing of eight cottages at Sheffield, in Bedfordshire. Four of the five families have been obliged to remove to Bedford, 10 miles away, and Arlesay, 4 miles away, although their work is in Sheffield, while one infirm woman has been taken to the workhouse infirmary, none of them being able to obtain suitable cottages.

A Disputed Case.

At Reigate, where the District Council has been requested to give further attention to an unfavourable report submitted by the Inspector of the Local Government Board at a meeting of the Council has been held, and the report severely criticised. It was decided to point out to the Local Government Board that in no case had it been found necessary to call the attention of the Council to the deficiency in the housing accommodation, that the figures given by the inspector appeared to be the minimum as regards wages and the maximum as regards rent, that, though rents might be higher than in some parts of the county, wages were higher also, and that after full consideration of all the circumstances they did not think it would be prudent to undertake the provision of accommodation for the working-classes.

Improvement Scheme, City of Indore.

MR. H. V. LANCASTER, F.R.I.B.A., has been commissioned to prepare an improvement scheme for the city of Indore, for the Maharajah of Indore, for the difficulty at Indore, as in many other towns in India, is that in the growth of the city very congested and insanitary areas have been produced, and the population is from time to time decimated by plague. It is hoped that by the carrying out of extensive improvements these defects will be remedied and obviated in the future.

The East Birmingham Scheme.

THE Town Planning Committee of the Birmingham City Council has now completed their town-planning scheme for East Birmingham. They have adopted the principle of dividing the area into zones, with different building densities. The lowest limit was twelve houses to the acre, and the highest limit was eighteen houses to the acre. There was also an intermediate zone, which would give fifteen houses to the acre. In all cases the maximum number

of houses which could be built on a site was twenty. They have inserted a clause in the bye-laws to keep advertising under the control of the Corporation, and another clause of the Corporation to make railway sidings areas, and to give the use of them to manufacturers on such terms as may be thought desirable. The Committee obtained the sanction of the Council for application to the Local Government for permission to prepare a scheme for the area of the Corporation. Yardley, and now proposed to ask to sanction an application to prepare a scheme for Stechford.

Proposed Garden City, Southport.

FOLLOWING the announcement of Southport with effect recently, for a town-planning scheme, has been sanctioned by the Local Government Board. The scheme will be about 3,000 acres in extent, embracing the village of Alsedale, and the present has in other directions where the land is well situated on the coast, the railway facilities exist already, the borough will prove attractive, and proposed to invite designs.

A Limit to the Size of Buildings.

THE announcement of the Earl's Court authorities, considering the enormous size of the largest hall in the world, a roof span of over 100 feet, raises the question as to whether it is a practical necessity for limiting the size of buildings in a city. The area of the building can occupy seems to be determined by the necessities of the traffic and for free intercommunication between parts of the town. No building should be so much ground as to cut off direct communication unless, like a palace, it is of great importance, or, like a public building, it has other advantages which make an adequate compensation for the inconvenience. The new London County Council Offices, with a length of over 800 feet, inconveniently large from the point of view were they not placed on a river, where no question of intercommunication arises, but, even so, they appear to be a point in size at which the convenience of building ceases, even from its own view. The bank of a river, where communication from side to side is already rather difficult, seems the natural position for such a building as require great length, but when the building is in districts where the traffic cannot be taken with the treatment adopted at the taking the traffic through the ground, the building appears to be the most expedient. We seem to need some pronouncement as to the distance of streets with reference both to the convenience of traffic and to the development of the district between them.

Reconstruction of Our Streets.

IN spite of the efforts of the public interest in the reconstruction of our streets, with the help of the daily Press the public can be influenced, and he is to be thankful that the design of our cities really is that it vitally affects their health and that they say nothing of their comfort or their interests. We are glad therefore to see the *Westminster Gazette*, in commenting on the piecemeal way in which our streets are pieced, points out that:—

"It seems a pity that in undertakings of this kind we have not the public supervision which is taken of course on the Continent. The street will be as great a medley of styles and disproportionate buildings, with most of the more prominent hidden behind huge advertisements, and deal with our streets as a whole, are in danger of destroying the enlightenment of the past."

This destruction of such schemes as the design for Regent-street, the saddest part of the kind we have not cannot yet rise to the height of the streets as a whole, let us at least work of those who could. If it is still to establish general regulations for the London, at any rate it should be to make special regulations for the piecemeal pieces of comprehensive design remain to us and to ensure that they shall be dealt with as a whole.

Dealing with their proposal that a national site rate, say, of 3d. in the pound on site values

should be levied and distributed according to the needs of rural districts, he says that any sum over 1s.6d. in the pound would cause a greater burden on agriculture. After quoting evidence given by members of the group, Mr. Eve remarks: "The question of necessary technical knowledge and departure from town life to village life never seems to bother these enthusiasts." He had made a valuation of the parish of Pavenham, omitting the Midland Railway main line running through it, to show the effect of the proposed tax of 3d. in the pound on site values, and found that the occupiers or owners there would be called upon to make a new and additional contribution of over 3000. per annum to the Treasury. The rates at 4s. in the pound on buildings and 2s. in the pound on land produced approximately an equal sum, so that the burden of the parish would be doubled. Such a tax was estimated by its advocates to yield 30,000,000, and as the Treasury already made grants, etc., to the amount of 25,000,000, Pavenham would receive in theory some part of the 5,000,000, but he did not anticipate that the parish would be credited with larger sums than at present. Why, remarks Mr. Eve, the general taxpayer should benefit at the expense of Pavenham seemed a reversal of common sense and justice.

THE TRADES' TRAINING SCHOOLS, GREAT TITCHFIELD-STREET, W.

We have received the report of the judges on the work done at the Trades' Training Schools of the Worshipful Companies of Carpenters, Joiners, Painter Stainers, Plasterers, Tylers, and Bricklayers, and Wheelwrights, at No. 153, Great Titchfield-street, W., and we have pleasure in calling attention to the good work of the Associated City Companies in their endeavour to improve the technique of each craft by instructing the men who actually earn their living by their labours therein. According to the report of the Chairman of the Schools' Committee (Mr. John Willson, J.P.), no student is admitted unless actually engaged in the trade in which he seeks to perfect himself; only *bona-fide* craftsmen are received, and then carefully trained. Many of the men who have availed themselves of the instruction are now occupying important and well-paid posts, and the number of students is still increasing. The judges have expressed general satisfaction with the work of the School, for the exhibition of which a room has been set apart at the Carpenters' Hall.

Mr. H. Phillips Fletcher, F.R.I.B.A., the Director of the Schools, in reporting on the work done, mentions that the Schools were established nearly twenty years ago. The aim throughout has been to raise the general standard of technique in the various crafts by educating the younger generation in the most practical methods of workmanship, and also to assist the craftsman out of the groove or mere mechanism and fit him to do his work with intelligence and skill.

Particulars relating to all the classes for Session 1912-13 can be obtained at the Schools, 153, Great Titchfield-street, W.

PROPOSED GLASGOW BUILDING TRADES EXHIBITION.

A meeting of the Glasgow and West of Scotland Building Trades Employers' Council was held on Monday last week in the Secretary's Office, 204, St. Vincent-street. Mr. William H. Baxter, Chairman, presided. A report was submitted regarding the negotiations which had passed with the International Building Trades Exhibition Company in connexion with the proposal to hold a building trades exhibition in Glasgow in September, 1913. The Chairman expressed the opinion that the exhibition would stimulate the building trade in Glasgow and neighbourhood, and being the first of the kind held in Glasgow, would be most interesting and instructive.

The Secretary reported having communicated with the Secretaries of the Associations affiliated with the Council regarding the arrangements contemplated by Sect. 99 of the National Insurance Act, under which the Board of Trade undertake on behalf of employers the custody, stamping, distribution, and exchange of contribution cards and unemployment books. He also reported that he had

written to the Town Clerk regarding the contracts for the extension of Glasgow Municipal Buildings, stating that they hoped the various contracts would be given out to separate contractors for each branch of work.

GENERAL BUILDING NEWS.

RENOVATION OF WEST PARISH CHURCH, GREENOCK.
The renovation of the West Parish Church, Greenock, has now been completed. It comprises generally the addition of a choir chancel and vestries, the reseating and redecoration of the old building, and the installation of a new pipe organ. The work has been carried out from the designs and under the supervision of Mr. John Keppie, F.R.I.B.A., of Messrs. Honeyman, Keppie, & Mackintosh, architects, Glasgow.

HOLY TRINITY CHURCH, SOUTHPORT.
This church, originally erected in 1837, is being rebuilt from the designs, published in the *Builder*, December 24, 1904, of Mr. Huon A. Maiter, F.R.I.B.A. Services are held regularly in the new building, and it is expected that the tower will be completed early next year. Messrs. John C. & Frank Woods, of Bolton, are the contractors.

LANCING COLLEGE, SHOREHAM.
A new wing has been added to Lancing College, near Shoreham, and will be formally opened on September 19. The architects are Messrs. Simpson & Ayton, of London, and the contractors are Messrs. Trollope & Colls, also of London. Further extensions are to be carried out at the college, including a 70-ft. tower, dormitories, and studies.

SHREWSBURY BRIDGE IMPROVEMENT.
Mr. H. Shelford Bidwell, M.Inst.C.E., held an inquiry at Shrewsbury on the 28th ult. on behalf of the Local Government Board concerning an application of the Shrewsbury Corporation for sanction to a loan of 12,000. to defray the cost of a scheme for widening the English Bridge. The scheme provides for an additional width of 15 ft. 7 in. and slightly reducing the present gradient, which is one in sixteen. It is proposed to retain the main architectural feature of the bridge.

SEWAGE FARM, COVENTRY.
It is proposed to carry out an extension scheme at the Coventry Sewage Farm at an estimated cost of 35,880. The Council have decided to adopt the scheme and to make application to borrow the sum required for the purpose.

SEWAGE WORKS, BENTLEY.
A Local Government Board inquiry was held recently with reference to the application of the local Council of Bentley for sanction to borrow 12,225. for the construction of sewerage and sewage disposal works. The scheme has been prepared by Messrs. Balfour & Co., of Newcastle, and the inquiry was conducted by Mr. A. G. Drury, M.Inst.C.E., the Local Government Board Inspector.

A NEW INFIRMARY IN LANCASHIRE.
The Alder Hey Chronic Hospital, to contain 1,000 beds, is in active progress, the cost, without equipment, being estimated at about 100,000. Mr. Charles H. Lancaster, F.S.I., Surveyor and Valuer to the West Derby Guardians, is the architect, and the general contractors are Messrs. Horace Kelly & Brother, of Walton, Liverpool.

EXTENSION OF GASWORKS, TIPTON.
At a meeting of the Tipton District Council the following tenders were accepted for extensions to the gasworks:—Mr. J. E. Proberts, of Bilston, 489s. for the boiler-house; Messrs. R. J. Dempster, of Manchester, 440s. for the scrubber, and 235s. for the engine and exhausters; West's Gas Improvements Company, of Manchester, 9,700s. for the vertical retorts. The Council also accepted the tender of Messrs. Thompson & Farley, of Kidderminster, of 5,686s. for a sewage disposal scheme.

INSTITUTE, KIRBYMOORSIDE.
The foundation-stone has just been laid of a new church institute at Kirbymoorside. The cost of the new institute is 1,600.; the plans have been prepared by Mr. Temple Moore, of London, and the construction of the building has been let by contract to Messrs. Rickaby & Sons, of Kirbymoorside. The building is to be a two-story one, and the ground floor will comprise a billiard-room, cloakrooms, a kitchen, and caretaker's apartments, while the first floor will be devoted to the purposes of one spacious hall for meetings, etc.

MEASLES PAVILION, DUNDEE.
A measles pavilion with an administrative block for further extensions at King's Cross Hospital is to be erected, the total outlay being over 12,000. At a meeting of the Public Health Committee, the City Engineer (Mr.

James Thomson) reported that on the basis the lowest tenders opened at the previous meeting, the cost of the respective blocks a buildings was as follows:—Measles pavilion for forty beds, 5,250.; discharge block, 2,250.; administrative block, 4,047.; kitchen block, 952.; corridor, 922.; and tunnels for pipe, 380.—a total of 11,855. If the measles pavilion were constructed with timber work covered with corrugated iron, the cost would be reduced by 1,500., while the cheaper form of construction would result in modifications of the method of construction.

WORKPEOPLE'S DINING HALL, WILLINGTON QUAY.
A dining-hall, capable of seating 400 persons has been erected by Messrs. R. Hood, Hagg & Son for the benefit of the workers in the rope factory at Willington Quay. The contractor is Mr. J. McHarg, and the architect Mr. Edward Cratney, of Wallsend.

TRADE NEWS.

Under the direction of Mr. A. J. Lacey, architect, Norwich, the "Boyle" system ventilation (natural), embracing Boyle's late patent "air-pump" ventilators and air-inlets has been applied to Holy Trinity Church, Norwich.

Messrs. O'Brien, Thomas, & Co., of 17 and 18, Upper Thames-street, E.C., and Excel Works, Hatcham, S.E., have recently supplied one of their D. O. Boyd's hygienic grates to the New Malden East Special Subjects School for the Surrey Education Committee. They are also supplying three of their D. O. Boyd's hygienic independent stoves to St. Mark's School, Reigate, for the same Committee.

Messrs. Brown & Backhouse are installing passenger lift in the Town Hall, Liverpool. The St. Paul's Schools and Institute, Newport, are being ventilated by means of Shorland's patent exhaust roof ventilators, supplied by Messrs. H. H. Shorland & Brother, Ltd., of Failswoy, Manchester.

NATIONAL INSTITUTION OF APPRENTICESHIP.
The Council's Report for 1911 sets forth that during the twelve months 193 boys and thirty-two girls were bound in apprenticeship and indentures, and that the numbers would have been much larger if the Institution had funds wherewith to make grants in payment of premiums, or by way of supplementing wages when they are low. In 1911 117 apprentices completed their indentures, and nearly 100 remained in the employment of the masters, whom they had been apprenticed. In the interval, May, 1905–December 31 last, 12 apprentices were bound to masters in various trades.

NEW PAVING IN HOLBORN.
Norwegian granite blocks are being laid in High Holborn in place of the asphalt road surface. This return to the older material has been brought about partly by the general use of rubber tyres on vehicles.

PROJECTED NEW BUILDING IN THE PROVINCES.*

ALDERSHOT.—Theatre, Station-road, for the Aldershot Picture Palace Company, Ltd. Ashton-on-Ribble.—Erection of St. Andrew Church; Messrs. T. Croft & Sons, builders, Ashton-on-Ribble.

Barnmouth.—Alterations to school; Architect Merioneth County Council, Portmadoc.

Barry (Glam.).—Drill hall; Messrs. Feather Wilson, architects, Queen-street, Cardiff.

Belfast.—Prudential offices, Wellington Square; Mr. P. Waterhouse, architect, Staple-in-buildings, High Holborn, W.C.

Bingley.—Alterations to school; Mr. I. Bottomley, Surveyor, Urban District Council Offices, Bingley.

Birmingham.—Premises for Mr. J. Wright, gas-stove manufacturer; Mr. W. J. Gibbs, builder, King's Heath, Birmingham Theatre, King's Heath; Mr. F. Reynolds, architect, 7, Waterloo-street, Birmingham Theatre, Small Heath; Messrs. Hipkiss Stephens, architects, Martineau-street, Birmingham. Premises for Messrs. Lambourn & Co., jewellery manufacturers; Messrs. Barnsley & Son, builders, Ryland-street, Birmingham Theatre Royal, Aston; Messrs. Garfield & Sons, builders, 39, Chain-walk, Loddles, Birmingham Shops, Solihull; Mr. P. G. Co. builder, Grove-lane, Handsworth, Warehouse Messrs. J. Dallow & Son, builders, Blackheath Birmingham. Extensions to All Saint Church, King's Heath; Messrs. A. Harrison Cox, architects, Birmingham.

Broadway.—School; Mr. A. W. Priestley, County Council Offices, Worcester.

* See also our list of Competitions, Contract etc., on another page.

Leethorpes.—School on site opposite St. Peter's-road. Mr. S. M. Grant, Lindsey County Council Offices, Lincoln.

Rich.—Alterations, etc., to St. Mary's church, for the Vicar.

St. Albans.—Buildings in connexion with the railway's Explosive Works; Messrs. R. Cur & Son, builders, 28, Greenside-place, St. Albans.

Waverley.—Additions to isolation hospital (1000); Mr. J. B. Williams, Surveyor, Town Hall.

Weymouth.—Additions to infirmary; Messrs. Hamcock & Son, architects, Branch 4, Batley. Enlargement of Wheelwrights' tools (3,500), for the Endowed School, Weymouth.

Widcombe.—The following plans have been passed: Three houses, Vine-mews, for Mr. J. A. Oakden, architect. Four houses, Ringwood-road; Mr. W. R. Box, architect. Mr. W. Llewellyn, builder. Five houses, St. Andrew's-road; Mr. William Hookham, builder. Addition to the Hydro Hotel, Mount St. Andrew, for the Eastbourne Hydro Hotel Company; Mr. J. W. Woolnough, architect.

Widcombe.—Additions to bakery, Dalderstone (2,000), for the Bainsford and Graham Co-operative Baking Society.

Widcombe.—Additions to Holme Mills for Messrs. Lockwood & Son, woollen manufacturers.

Great Harwood.—Church and presbytery; Messrs. St. Wulston's, Rishton street, Great Harwood.

Great Yarmouth.—Plans have been passed as follows:—Rebuilding premises, St. Peter's-row, for Mr. De Haaf; warehouse, etc., Row for Messrs. Palmers and three houses, Canville and Century-roads, for Mr. C. Church.

Guardsbridge.—Extensions to mills for the Guardsbridge Paper Company, Ltd.

Huish (near Yeovil).—Additions to St. Andrew's Church (160 extra places) for the church.

Kearsley.—Extensions to mills for Messrs. Fletcher & Sons.

Kennmare.—Carnegie library (1,377); Mr. J. J. J. builder, Castlelea.

Kilbirnie.—School between Kilbirnie and Glasgow (400 places); Messrs. H. & D. Murray, architects, 245, St. Vincent-street, Glasgow.

Kilgarvan.—Residence for Medical Officer (500); Messrs. Duggan Brothers, builders, Newcastle, Cork.

Macclesfield.—Alterations to St. George's school (3,000); Mr. F. R. Oldfield, Town Hall, Macclesfield.

Mundessley.—Restoration of All Saints' church; Messrs. Lacey & Upcher, Upper Marlborough, Kent.

Nechells.—Electricity station; Mr. R. A. Lattock, City Electrical Engineer, Town Hall, Birmingham.

New Delaval.—Alterations and additions to school for the Delaval Coal Company, Newcastle-buildings, Newcastle.

New Kyo.—Swimming-baths; Mr. Thomas Welch, care of the Trustees of the Miners' all, New Kyo.

Nuneaton.—Additions at Abbey Mills, Nuneaton; Messrs. Hall & Phillips, industrial manufacturers.

Pennyboy.—School; Mr. V. Morgan, architect, Spilman-street, Carmarthen.

Pirvin (Pershore).—Houses; Messrs. Dicks & Aldon, Evesham, Worcestershire.

Parleigh (Essex).—School; Mr. F. Whitmore, architect, Duke-street, Chelmsford.

Redditch.—Cookery school (1,700); Mr. V. Lowe, architect, Foregate-street, Worcester.

Rowtenhall.—Eleven houses; Mr. W. Ashforth, builder, Burnley-road, Waterfoot.

Ryhope.—Council offices (1,420); Mr. J. Lunley, builder, care of the Town Clerk, Ryhope Council Offices, Ryhope.

Salford.—Erection of wall to embankment to canal, and pit for coal conveyor at Electricity Works, Frederick-road (1,157); Messrs. J. Terratt & Sons, Ltd., builders, Swinton. Plans have been passed for alterations and extensions to the Bay Horse Inn, 119, Ordsall-avenue, and to works, Leigh-street.

Sharrow.—Extensions, etc., to St. Andrew's church (1,200), for the Vicar.

Southampton.—School, King Edward-avenue; Mr. J. A. Crowther, Engineer, Town Hall.

Staffs.—Drill hall at Handsworth and Lichfield; Mr. C. Cowlishaw, architect, Stafford.

Swansea.—Extensions to works (100,000). For the Cwmfelin Steel and Tin Plate Company, Ltd., Carmarthen-road, Swansea.

Thomastown.—Forty-four houses (9,945); Mr. R. Lloyd, builder, Cefn, Glam.

Tunstall.—Fire-station; Mr. T. Young, Surveyor, Rural District Offices, Sunderland.

Whitefield.—School; Mr. R. Littler, architect, Ribblesdale-place, Preston.

Wilts.—Schools, Idmiston and Rodbourne

Cheney; Mr. J. G. Powell, County Hall, Trowbridge.

Wolverhampton.—Metropolitan Bank premises, Lichfield-street; Messrs. Cossins, Peacock, & Bewlay, architects, Colmore-row, Birmingham; Mr. T. Elvins, builder, Naden-road, School, Birmingham. Nursing home; Messrs. T. & S. Ham, builders, 31 and 32, Mander-street. Rebuilding and enlargement of bank for the National Provincial Bank, Ltd.

Yateley (Hants).—School; Mr. W. J. Taylor, The Castle, Winchester.

LONDON COUNCILS.

Tottenham.—The following plans have been passed:—Mr. J. W. S. Appleton, additions to No. 141, Northumberland Park; Messrs. Goodall & Son, alterations to White Hart public-house, High-road; the Cedex Electric Traction Company, conversion of the Stamford Hill Skating Rink, High-road, into motor assembly; Mr. T. Stevens, two houses and shops, High-road; the Metropolitan Electric Tramways, garage at High Cross.

Watford.—Plans submitted by Messrs. Dickinson & Co. have been passed for extensions at their Croxley Mills.

FOREIGN AND COLONIAL.

Building Materials, Brazil.

The *Diario Official* of July 23 publishes decree No. 9,693, opening in favour of the Ministry of Posts and Telegraphs a credit of 404,272 milreis (about 27,000*l.*) for the purpose of completing the erection of a building intended for a postal-telegraph office in Porto Alegre, State of Rio Grande do Sul.

Building, etc., Russia (Poland).

The following information is from the report by H.M. Consul at Warsaw (Mr. C. Olive Bayley) on the trade of Poland and Grodno in 1911, which will shortly be issued:—Though the number of houses built or repaired in Warsaw itself declined from 1,645 in 1910 to 1,425 in 1911, there was a considerable increase in building activity in provincial towns and in the country. High rents and the increased cost of living are gradually driving the less well-to-do classes to live in small country places in the neighbourhood of Warsaw, especially such as are served by the principal lines of railways, and in consequence there has been an abnormal development of such villages into small towns. This change has, to a great extent, been assisted by the fact that no extension of Warsaw beyond its limited boundaries has been possible in consequence of the refusal of the military authorities to allow any substantial buildings in the neighbourhood of the fortifications. In August, 1911, this prohibition was, to a great extent, withdrawn, and the near future should open up possibilities for the sale of British building material in the new areas of construction, which will have now been made available. Much will depend on the extension of the present system of tramways to these new suburbs, and the improvement of the service of the light railways which exist on both sides of the Vistula. Here again British capital might be used with every prospect of satisfactory returns. The improved building standard is still making great headway; iron construction has made considerable advance and so-called fireproof buildings are the only type now sanctioned. This naturally creates a demand for fireproofing materials, which is worthy of attention from British manufacturers.

PATENTS.

APPLICANTS PUBLISHED.*

17,742 of 1911.—Albert David Le Croissette: Draught-excluding doors.

17,757 of 1911.—John Henry Faulkner: Door fasteners and the like.

17,802 of 1911.—Clara Hedwig Martini: Apparatus for regulating the temperature of rooms heated by central heating plants.

18,394 of 1911.—William Calway (Director of the Building and States Development Company, Ltd.): Building of concrete, cement, and like walls.

19,996 of 1911.—James Henderson: Ball-cocks for cisterns and water-taps.

23,537 of 1911.—John Thomas Johnson: Tile asphards, curbs, or fenders for fireplaces.

24,099 of 1911.—Arthur Richard Abrey: Water taps and valves.

27,001 of 1911.—George Eagle: Theodolites.

2,667 of 1912.—William Burrow Shorland: Handles and their fittings for doors or the like.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

3,841 of 1912.—Thomas Ashby: Apparatus for cleansing sewers, drains, and the like.

4,072 of 1912.—Alfred Ernest Wheeler and Charles Hawkes Ridley: Systems of hot-water circulation.

5,405 of 1912.—Roland Krämer and Carl Krämer: Means for securing brackets for curtain poles and the like to walls.

8,055 of 1912.—William Clark and John Paterson Andrew (Andrew Clark & Co.): Platform ladders.

9,542 of 1912.—William Henry Lloyd: Mounting of water closet bowls.

11,950 of 1912.—August Straub: Flushing device.

SELECTED PATENTS.

9,835 of 1911.—George Naklik: Cows.

This relates to chimney and ventilating shaft cowl having conical wind-catching and wind outlet pipes, in the latter of which a cone is fixed, which are arranged so that a reinforced current of air is conducted over the smoke outlet, in a direction parallel to its mouth. The rotary head *h* contains the conical wind inlet and outlet pipes *f*, *g* respectively, their narrow ends being held in the ring-like portion of the spindle *e* on which the head turns. The

9,835 of 1911.

wind-outlet pipe *g* projects beyond the mouth of the shaft *a*, and its walls are so inclined that, if prolonged, they would encounter the edge of the head *h*. These supposed prolongations *x*, *y* form the surface of the smoke-escape opening, over which, by the aid of the cone *l*, a current of air passes in a direction parallel to that of the surface, so exerting a suction action. The cone *l* is adjustable in the pipe *g* to vary the suction action. A cleaning door *b* is provided in the shaft *a*.

OBITUARY.

Mr. R. C. Jones.

Mr. Richard Cornwell Jones, who died on August 25 at the advanced age of seventy-six, at 113, Selsdon-road, Croxford, was for many years a resident of Ryde, where Swanmore Church and a house in West-street, close to the Parish Church, were erected from his designs. He superintended the construction of the spire of the Parish Church at Ryde, said to be a copy of the one at Oxford. A fine peal of eight bells is in that steeple.

Mr. J. Baker.

Mr. John Baker, ecclesiastical carver, who was well known in Beverley because of the work he carried out at the Minster during the past twenty years, passed away at his home in London recently. Among Mr. Baker's chief works were the carvings in the Lady Chapel, St. Albans Abbey; the west front of Hereford Cathedral, Selby Abbey restoration, and the new south transept, Selby; Sledmere Church and Sledmere Cross, Dublin Cathedral restoration, Armagh Cathedral, St. Peter's Church, Belfast; Twickenbury Abbey, Southwark Cathedral, St. John's Gate, London; and Ripon Cathedral and Macclesfield Parish Church, Wrexham Parish Church, and at Beverley Minster, where his work included the restoration of the grotesques on the arching in the interior at the north side, and a great deal of other carving, both interior and exterior. He was sixty-five years of age.

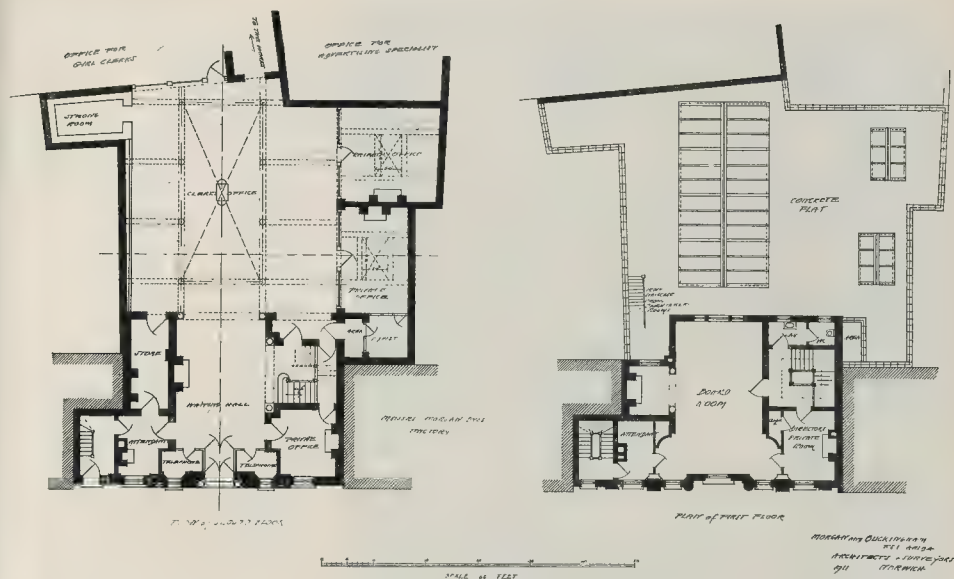

Business Premises, Norwich.

Business Premises, Norwich.

Messrs. Morgan & Buckingham, Architects.

Business Premises, Norwich.

Messrs. Morgan & Buckingham, Architects.

BUSINESS PREMISES AT NORWICH.

THESE premises have been erected recently in Norwich for Messrs. Coleman & Co., Ltd., manufacturers of Wincarnis, and for Messrs. Morgan Bros., boot and shoe manufacturers.

The new offices for Wincarnis include, on the ground floor, a large waiting hall, general office with accommodation for forty clerks, and three private offices for the management, and also accommodation for an attendant, strong-room, cloak-room, etc. The first floor is entirely taken up by the board-room and directors' rooms, and on the second floor are the attendants' living-rooms.

The original offices on the ground floor at the back of the new building have been adapted to accommodate twenty girl clerks.

The general contractors were Messrs. Anderson & Son, of Norwich, and the reinforced concrete flats with supporting beams were carried out by Messrs. Bradford & Co., of Homerton, London, and are covered with Limer's asphalt.

The heating of the whole of the offices was carried out by the Brightside Engineering Company, and is by hot water from a calorifier supplied with steam from the works boilers.

Open fireplaces are also provided in all the rooms, and in the general offices is fixed a Shoreland's green faience double central stove.

The main staircase and the screens in the entrance-hall are a combination of white enamel woodwork and oak polished with beeswax, the front counter and desks being in mahogany polished to a dark rosewood colour.

The walls throughout the building are decorated in a cream colour with ivory-white ceilings and fibrous plaster enrichment, and the board-room walls are panelled with Carton Fibre enrichment, this work being carried out by Messrs. W. G. Crotch & Son, of Norwich.

The masonry on the street elevation is of Ancaster stone, and is the work of Mr. Edward Potter, and the carving is by Mr. Hubert Miller, both of Norwich.

The adjoining building of Messrs. Morgan Bros. has an entirely new frontage to the street, with a depth of about 20 ft., which was erected at the same time as the Wincarnis offices by Messrs. T. Gill & Son, of Norwich.

Adjoining this factory to the north is a further addition to Wincarnis works, which comprises a loading dock for two vans and a packing floor of reinforced concrete with a north-lighted roof of timber and Simplex glazing. The cost of the buildings without their equipment was about 12,000*l.*

VILLAGE HALL, TOYS HILL.

TOYS HILL is a small hamlet between Westerham and Sevenoaks. There being no church, the back portion of the platform is separated from the rest by a movable screen, the part behind the screen being consecrated so that the hall can be used for religious services. When the screen is pulled across the chancel portion the hall is available for all the usual secular purposes of a village hall. It is quite simply built of local brick covered with rough plaster, the roof covered with Dutch pantiles, the lower portion with Westerham plain tiles. The roof is constructed of pitch-pine left from the tool. The panelling is of oak left from tool, and was presented by Mr. Owen Fleming as a memorial to his late wife. The clock was presented by the villagers, also in memory of the late Mrs. Fleming. The cast lead panel round the clock and the clock face were designed by the architect, Mr. J. Algernon Hallam. The model for the panel was made by Mr. Gelleck, sculptor.

The builder was Mr. John Capel, of Toys Hill who, together with his foreman, Mr. Horace Bunhell, took great interest in the work. The flight of external steps are in dull red local bricks. The heating is by Messrs. Strode & Co.

BOOKS.

Memorials of Old Nottinghamshire. Edited by EVERARD L. GUILFORD, M.A. Illustrated. (London: George Allen & Co., Ltd., Rathbone-place, W. Demy 8vo. 15s. net.)

This volume consists of a collection of fifteen essays, all of interest and some of special architectural value. The Editor's two contributions, an opening chapter on "Historical Nottinghamshire," and "The Civil War in Nottinghamshire," and other essays in the book give point to the following paragraph from the Preface:—"The present Editor has tried to choose his subjects from a field as varied as possible, and he

[Photo. by W. H. Drake.]

ventures to think that papers will be found here which will be welcome both on account of the matter to be found in them and because of the novelty of the subject." Those who read the articles already mentioned, and others on "Nottinghamshire Poets," "The Forest of Sherwood," "The Ancient and Modern Trent," "Nottingham," "Southwell," "The Nottingham Mint," "The Clockmakers of Newark-on-Trent," will, we believe, endorse this remark; but architectural readers will be more directly interested in the following chapters:—"The Mediaeval Church Architecture of Nottinghamshire," by Mr. A. Hamilton Thompson, M.A., F.S.A.; "Newstead Priory and the Religious Houses of Nottinghamshire," by the Rev. J. Charles Cox, LL.D., F.S.A.; "Wollaton Hall," by Mr. J. A. Gotch, F.S.A.; "Roods, Screens, and Lofts in Nottinghamshire," by Mr. Aymer Vallance, F.S.A.; "Nottinghamshire Spires," by Mr. H. Gill; and "Low Side Windows of Nottinghamshire," by the same writer, in which some suggestive conclusions are arrived at. "A systematic survey of all the low side windows in the county has led me," says the author, "to the conclusion that they were not all made for one and the same purpose." As to the openings which were originally fitted with an oak shutter as distinct from those that were rebated for glass, the author is of opinion that they were made for the purpose of ringing the sacring bell, while the glazed openings were intended simply to give light. Both Mr. Gill's chapters are well illustrated, a remark which applies to the able articles by Mr. Vallance on "Roods, Screens, and Lofts," and "Mediaeval Church Architecture," by Mr. Hamilton Thompson. The whole volume is of considerable interest, and it should find many readers.

The Country Gentleman's Estate Book, 1912.

Edited and compiled by WILLIAM BROOMHALL, (London: The County Gentlemen's Association, Ltd., 24 and 25, St. James's-street, W.C.)

THE Estate Book, to give this work its short title, has this year reached its decennial issue,

and we believe the present volume will prove of equal interest and usefulness to any that have preceded it. It contains much useful information on estate law, forestry, farming, gardening, and especially, from our point of view, on estate management and work. Included in the volume are articles or notes on: "Bungalows," by Mr. W. J. Chambers, F.R.I.B.A.; "Defects in Buildings and their Effect on Valuation," by Mr. H. Griffiths, A.R.I.B.A.; "Garden Cities at Home and Abroad," by Mr. Georges Benoit-Levy; and notes, reports, etc., of considerable interest. The volume is well arranged and edited.

PHASES OF ARCHITECTURAL EDUCATION.

THE following is a paper by Mr. Lloyd Warren, read on the occasion of the Forty-fifth Annual Convention of the American Institute of Architects at Washington, and taken from the *Proceedings* of the Convention published by the Board of Directors of the Institute (Mr. Glenn Brown, editor):—"How interesting it would be could we follow the phases of architectural training through the Middle Ages! How inspiring it would be to us, who seek to perfect this training at the present day, if we knew the influences which raise the art from the crude barrel-vault and block capital of the early Romanesque to the tenuous stone construction and the florid carving of Troyes and Notre Dame de Brion!"

Nothing, however, is left to give us a hint as to how the science of the builders was transmitted from generation to generation in those days. The mediaeval master-builder has passed away and has taken his secret with him; scarcely a document has remained, and nothing to inform us of his educational system. The builders before the Renaissance were a vast secret association, living and working apart from the rest of the world; migrating in companies when one cathedral was finished to the site of another which was

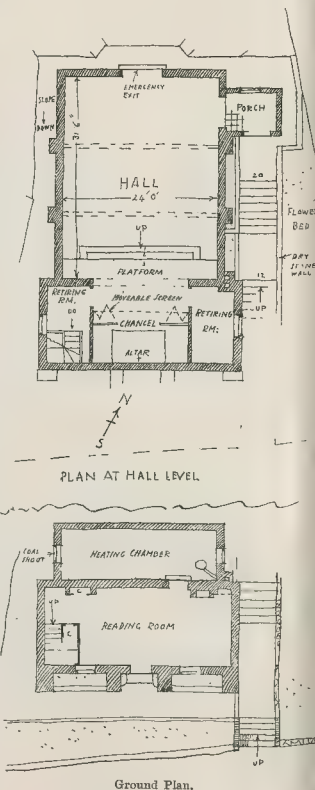

beginning, guarding their secrets jealously, mystic and tenebrous as was the age wherein they lived, and with that age they melted away before the brilliant rays of the Reformation and the Renaissance.

Then came the age of the despots, the litterati, and the precious, the pagan worship of the purely beautiful, which thrust aside the expression of construction as a thing inelegant and barbarous, and summoned the artist of pure form to build its temple. *Aenea Sylvius* and *Filippo Strozzi* thus called for the services of the sculptors *Rossellino* and *Benedetto da Majano*, and for nearly a century after only sculptors and painters occupy themselves with the design of monumental edifices, then *Palladio* and *Serlio* codify the science of building design in such a way as to put its technique within reach even of the inartistic constructor; unfold, as it were, by machinery the secrets of the artists' magic of form and proportion, and create that phase of architectural education which with little change has come down to the present day.

Thus we may describe these phases from the time of the downfall of Rome, traditional through the Middle Ages, purely artistic through the Renaissance, and codified or systematised thereafter.

That this last phase still exists in Europe I believe, but in this country we are rapidly developing a new one, which we cannot but recognise, and that is, that of intensive specialisation. The elements which now enter into the profession of architecture are so vastly complex that it is virtually impossible for one man to master them all—think of them for a moment. Is it only necessary that one be a man of general culture, a man of affairs, and a gentleman for the public to hasten automatically to one's office? If we would not have important work slip through our fingers we must be so eminently men of affairs that affairs must

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, iv.; Public Appointments, xix.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

SEPTEMBER 9.—**Chorley**.—SCHOOL.—The Chorley Education Committee invite designs for Council school for about 500 children. See advertisement in issue of July 12. Premiums 50l., 20l., and 10l. Deposit, 2l. 2s.

SEPTEMBER 30.—**Dublin**.—UNIVERSITY COLLEGE: NEW BUILDINGS.—Limited to architects in Ireland. Assessor, Mr. H. T. Haro, F.R.I.B.A. SEPTEMBER 3.—**Llanelli**.—SCHOOL, ETC.—The Llanelly Education Committee invite competitive designs and estimates for school buildings and domestic buildings at Staboneth Terrace. Assessor, Mr. G. E. Halliday, F.R.I.B.A. See advertisement in issue of August 2 for further particulars.

OCTOBER 14.—**Balham**.—SWIMMING BATH.—The Wandsworth B.C. invite designs for a Public Swimming Bath. See advertisement in issue of August 16 for further particulars.

OCTOBER 29.—**Glasgow**.—DESIGNS FOR EXTENSION OF MUNICIPAL BUILDINGS.—The Glasgow Corporation invite architects to submit preliminary sketch designs in competition for the extension of the Municipal buildings. Five will be selected to submit complete drawings in final competition. See advertisement in issue of July 12. Dr. Burnet, assessor. Deposit, 1l. 1s.

OCTOBER 31.—**Huddersfield**.—TOWN PLANNING.—The Housing and Town Planning Committee of the Huddersfield Corporation invite designs for the laying-out of certain areas within the county borough and part of an adjacent suburb. Premiums 100gs., 50gs. and 25gs. Deposit of 2l. 2s. See advertisement in issue of August 2 for further particulars.

* OCTOBER 31.—**Llandudno**.—LANDSCAPE GARDENING.—The Llandudno U.D.C. invite designs for laying-out land adjoining the Happy Valley, about 20 acres in extent. See advertisement in this issue for further particulars.

NOVEMBER 1.—**Ottawa**.—MONUMENT TO KING EDWARD VII.—Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa. Particulars from the Public Works Department, Ottawa (see p. 174, August 9).

DECEMBER 1.—**Bulgaria**.—DESIGNS FOR A ROYAL PALACE AND LAW COURTS.—Particulars from the Commercial Intelligence Branch of the Board of Trade, Basinghall-street, E.C. (see p. 173, August 9).

DECEMBER 2.—**Carlisle**.—SCHOOL BUILDINGS, ETC.—Particulars from the City Surveyor, 36, Fisher-street, Carlisle.

FEBRUARY 1, 1913.—**Rangoon**.—MUNICIPAL BUILDINGS.—The Committee of the Municipality of Rangoon invite designs for the new Municipal Buildings, Nos. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, and 11, respectively for first, second, and third. See advertisement in August 2 and 30 for further particulars.

NO DATE.—**Doncaster**.—SWIMMING BATH, ETC. FOR YORKSHIRE INSTITUTION FOR THE DEAF.—Premiums, 50l. Information from Mr. B. D. Crouch, 6, Hall-gate, Doncaster.

NO DATE.—**Jordanhill, Glasgow**.—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in "Competition News," December 1, page 635.

NO DATE.—**Motherwell**.—HIGH SCHOOL.—Dr. Burnet, assessor. Premiums 50l., 30l., and 20l.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

SEPTEMBER 7.—**Gilcrux**.—ALTERATIONS.—Alterations to farm buildings at Gilcrux. Plans and specifications with Mr. J. Horney, architect, surveyor, and civil engineer, Maryport.

SEPTEMBER 7.—**Keighley**.—BUILDINGS.—For the construction of eight workmen's dwellings in the site of the new Lower Laithes reservoir works, Stanbury, near Haworth. Plans seen, and specification, form of tender, and schedule for completion, from Mr. J. Horney, architect, surveyor, and civil engineer, Maryport.

SEPTEMBER 7.—**Lyme Regis**.—DWELLINGS.—For the construction of eight workmen's dwellings in blocks of four. Plans and specifications at the Borough Surveyor's Office. Deposit of 1l. 1s.

SEPTEMBER 7.—**Lynton**.—SHED, ETC.—Erection of a gun and wagon shed and quarters at Lynton for a section of No. 1 Heavy Battery Devonshire Royal Garrison Artillery. Plans and specifications seen, and quantities, from Messrs. Ellis, Son, & Bowden, F.S.I., architects and surveyors, Bedford-chambers, Exeter.

SEPTEMBER 9.—**Bargoed**.—PREMISES.—For erection of shop premises in High-street. Plans and specification seen, and particulars from Mr. G. Kershaw, M.S.A., Station-road, Bargoed.

SEPTEMBER 9.—**Kenilworth**.—LONGER, ETC.—For the erection of lodge, chapel, etc., in connection with proposed new cemetery. Plans and specifications seen, and quantities, on deposit of 3l. 3s., from Mr. Sholto Douglas, C.E., Architect and Surveyor to the Council, Council Offices, Kenilworth.

SEPTEMBER 9.—**Maryport**.—ALTERATIONS.—For alterations to branch shop, Grassiet, for the Maryport Co-operative Industrial Society, Ltd. Plans and specifications with Messrs. W. G. Scott & Co., architects and surveyors, Workington.

SEPTEMBER 10.—**Elland**.—MILL.—Erection of a four-storied fireproof mill, 187 ft. long by 70 ft. wide, and chimney 50 yds. high, at Wellington Mills. Elland, Mr. Thos. Kershaw, A.R.I.B.A., architect, 26, George-street, Halifax.

* SEPTEMBER 10.—**Tilbury**.—MIXED SCHOOL.—The Essex Education Committee invite tenders for erection of a mixed school. See advertisement in this issue for further particulars.

SEPTEMBER 11.—**Wigg**.—32A WALLS.—For the reconstruction in reinforced concrete of two sections of the sea walls at Nigg, Ross-shire. Plans and specification with, and quantities from Messrs. George Gordon & Co., civil engineers, Inverness.

SEPTEMBER 11.—**Skelton Dale**.—SCHOOL.—For erection of a school. Plans seen, and specification, quantities, and forms of tender from Mr. F. B. Lewis, City Architect, Guildhall, Nottingham, on deposit of 2l. 2s.

SEPTEMBER 12.—**Hackney**.—UNDERGROUND CONVENIENCE.—The Hackney B.C. invite tenders for public underground convenience on eastern side of Kingsland-road. See advertisement in this issue for further particulars.

SEPTEMBER 13.—**Brighouse**.—SHED.—Erection of a shed, 132 ft. by 62 ft., at Brookfield Mills, Brighouse, for Messrs. Turner & Wainwright. Plans seen, and quantities from Messrs. Sharp & Waller, architects, 32, Bradford-road, Brighouse.

SEPTEMBER 13.—**Cork**.—THEATRE.—For building a cinematograph theatre in King-street, Cork. Quantities and particulars from the architect, Messrs. Arthur & W. H. Hill, 22, George-street, Cork.

SEPTEMBER 14.—**Inverness**.—PREMISES.—For works of new dairy premises, stabling, and covered yards, etc., to be erected at Waterloo-place, Inverness, for the Farmers' Dairy Company. Plans and specifications and quantities with Mr. Thos. Munro, architect, 62, Academy-street, Inverness.

* SEPTEMBER 14.—**Reckford**.—ALTERATIONS, ETC.—The Reckford Guardians invite tenders for alterations and additions to female wards at Union Workhouse Infirmary. See advertisement in this issue for further particulars.

SEPTEMBER 16.—**Eskevals**.—ALTERATIONS, ETC.—For extensions and alterations to the Range-house, Eskevals, Cumberland. Quantities: on deposit of 1l. 1s., from Vickers, Ltd., the Naval Construction Works, Barrow-in-Furness.

SEPTEMBER 16.—**Pomeroy**.—CHURCH.—For building a new church at Pomeroy, Co. Tyrone. Plans and specification with Messrs. William H. Byrne & Son, architects, 20, Suffolk-street, Dublin. Quantities by Mr. A. B. Brunk, of 5, Leinster-street, Dublin, on deposit of 2l. 2s.

SEPTEMBER 17.—**Birmingham**.—SCHOOL.—Erection of a new special Council school in Bristol-street. Forms of tender and quantities at the Finance Office at the Education Department, Council House, Margaret-street, Birmingham. Deposit of 2l.

SEPTEMBER 17.—**Edinburgh**.—LABOUR EXCHANGE.—The erection of a Labour Exchange at Lauriston-place, Edinburgh. Drawings, specification, and a copy of the conditions and form of contract at H.M. Office of Works, 3, Parliament-square, Edinburgh. Quantities and forms of tender on deposit of 1l. 1s.

SEPTEMBER 17.—**York**.—SHED.—The North-Eastern Railway invite tenders for the erection of an engine-shed at York. Plans and specifications seen, and quantities from Mr. William Bell, the Company's Architect, at York.

SEPTEMBER 18.—**Dublin**.—OFFICES.—For the new Government offices to be erected in Upper Merrion-street. Dublin. Quantities from the Secretary, Office of Public Works, at Upper Merrion-street, Dublin, on deposit of 5l. 5s. Drawings and specification at the Office of the Commissioners.

SEPTEMBER 18.—**Hull**.—SUB-STATION.—For the construction of electricity sub-station at St. Andrew's Dock. Forms of tender and particulars from Mr. A. E. White, M.Inst.C.E., City Engineer, Guildhall, Hull.

SEPTEMBER 19.—**Axbridge**.—BUILDING.—For constructing new latrine building on the men's quarters of the Axbridge Workhouse. Plans and specification seen, and form of tender at the Board-room, Union Workhouse, Axbridge.

SEPTEMBER 19.—**Hull**.—SCHOOL.—Erection of a fishermen's School in Boulevard. Drawings and specification seen, and quantities, on deposit of 2l. 2s., from Mr. Joseph H. Hirst, City Architect, Guildhall, Hull.

* SEPTEMBER 20.—**London**.—S.E.—DOMESTIC ECONOMY CENTRE.—The Governors of the Newcomen Foundation invite tenders for conversion of schools in Newcomen-street, Borough, into a domestic economy centre. See advertisement in this issue for further particulars.

* SEPTEMBER 24.—**Michelmersh**.—IRON COOKERY-ROOM.—Southampton C.C. invite tenders for corrugated-iron cookery-room at Michelmersh Council School. See advertisement in this issue for further particulars.

SEPTEMBER 24.—**Rhondda**.—RECONSTRUCTION.—For the pulling down and reconstruction of the Star Hotel, Ystrad, Rhondda. Quantities, on deposit of 2l. 2s., from Mr. T. B. Richards, A.R.I.B.A., architect and surveyor, Pontypool and Cardiff.

SEPTEMBER 25.—**Derrinkehir**.—SCHOOL.—For the erection of National School Building at Derrinkehir, Ballinamore, Co. Leitrim. Plans and specification seen at Ballinamore Royal Irish Constabulary Barrack.

* SEPTEMBER 25.—**Dover**.—POST-OFFICE.—The Commissioners of H.M. Works and Public Buildings invite tenders for new post-office at Dover. See advertisement in this issue for further particulars.

* SEPTEMBER 26.—**Burley**.—CLASSROOMS, ETC.—The Southampton C.C. invite tenders for additional classroom and storeroom, alterations to cloakroom, and regrading, graveling, and tarpaving playground at Burley Council School. See advertisement in this issue for further particulars.

OCTOBER 2.—**Cwmrhylidceirw**.—HOUSES.—The Great Western Railway invite tenders for the erection of four houses at Cwmrhylidceirw, near Morriston, Glamorganshire. Plans and specification seen, and forms of tender from the Engineer at Nash Station.

OCTOBER 7.—**Leeds**.—BUILDING.—Erection of a steel and corrugated iron building, and the necessary surface-water drainage of the same, at the permanent way depot, Sovereign-street, Leeds. Form of specification, tender, and quantities from Mr. J. B. Hamilton, General Manager, Standard-buildings, City-square, Leeds.

* OCTOBER 11.—**Cold Norton**.—SCHOOL.—The Essex Education Committee (Maldon District Sub-Committee) invite tenders for public elementary school at Cold Norton. See advertisement in this issue for further particulars.

NO DATE.—**Daventry**.—SCHOOL.—For the erection of a new public elementary school at Daventry. Architects, Messrs. Talbot, Brown, & Fisher, Wellingborough.

NO DATE.—**Denbigh**.—ADDITIONS.—For additions to a house and shop in Love-lane, Denbigh. Plans and specifications with Mr. J. D. Lewis, architect and surveyor, Denbigh.

NO DATE.—**Rotherham**.—EXTENSIONS.—Alterations and extensions of the St. Ann's-road Council Schools. Mr. Jas. A. Mair, Secretary to the Education Committee, Education Office, Rotherham. Deposit of 1l. 1s.

NO DATE.—**Scunthorpe**.—HOUSES.—Erection of four houses in Cole-street, Scunthorpe. Plans with Mr. H. S. Stalker, architect, 150, High-street, Scunthorpe.

NO DATE.—**West Hartlepool**.—DAIRY, ETC.—For dairy and boot repairing workshop for the Hartlepool Co-operative Society, Ltd. Architect, Mr. L. G. Ekins, Co-operative Wholesale Society, Ltd., West Blandford-street, Newcastle-on-Tyne.

ENGINEERING, IRON, AND STEEL.

SEPTEMBER 15.—**Monmouth**.—CONCRETE.—For concreting the floors of two buildings, the latter part belonging to the Royal Monmouthshire Royal Engineers (Special Reserve), situate in a field about a mile and a half from Troy Station Monmouth. Tender forms from the Officer Commanding, Royal Monmouthshire Royal Engineers (S.R.), The Castle, Monmouth.

* SEPTEMBER 15.—**Tooting**.—REPAIRING RAILINGS.—The Lambeth B.C. invite tenders for repairing the wrought-iron boundary railings of allotments adjoining Lambeth Cemetery, Black-Troy-road. See advertisement in this issue for further particulars.

ENGINEERING, etc.—continued.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

SEPTEMBER 21. — **Andover.** — PURIFICATION WORKS.—For the construction of screen chamber, engine-house, suction tank, 9-in. rising main, settling tank, holding-up tank, four circular bacteria beds, alterations and additions to existing storm-water tank, erection of cottage, and other works. Specification and drawings by Messrs. J. Taylor, Sons, and Santo Crimp, civil engineers, Caxton House, Westminster, S.W. Deposit of 5l.

SEPTEMBER 23. — **Broadstairs.** — WATER-SOFTENING-HOUSE.—For water-softening-house and ferro-concrete tank (Hennepin system) at Rumsfelds pumping-station, cast-iron pipes and specials, sluice valves, etc. Plans and specifications seen, and forms of tender from the Engineer, Mr. H. Hurd, C.E., Council Offices, Broadstairs.

SEPTEMBER 24. — **Whitefield.** — SEWAGE.—For extensions at sewage-disposal works, and for new sewerage works, comprising about 600 yds. of new sewers from 9 in. to 18 in. diameter, with necessary manholes, lamp-holes, etc. General conditions, specifications, quantities, and form of tender at the office of Mr. George M. Denton, Engineer and Surveyor to the Council, Council Offices, Elms-street, Whitefield. Deposit of 2l. 2s.

* SEPTEMBER 25. **Woolwich.** VERANDAH.—The Metropolitan Asylums Board invite tenders for constructing verandah, etc., at Brook Fever Hospital, Shooter's-hill, S.E. See advertisement in this issue for further particulars.

OCTOBER 1. **Melbourne.** — DREDGE.—For the construction and delivery at Melbourne of a twin-screw sand suction hopper dredge of 1,200 tons capacity. Deposit, 200l. Plans, specifications, and conditions at the office of the Agent-General for Victoria, Melbourne-place, Strand, London.

NO DATE. **Rotherham.** HEATING.—For the heating of the St. Andrew's Council Schools. Mr. Jas. A. Muir, Secretary to the Education Committee, Education Office, Rotherham.

FURNITURE, PAINTING, MATERIALS, etc.

SEPTEMBER 7. — **Backbarrow.** — PAINTING.—For the painting of business premises and the three cottages and the hall adjoining, for the Backbarrow Co-operative Society.

SEPTEMBER 9. — **Halifax.** — PAINTING.—For painting the Natural History Museum at Belle Vue, Halifax. Specifications seen, and forms of tender from Mr. James Lord, M.Inst.C.E., Borough Engineer, Town Hall, Halifax. Deposit of 1l.

SEPTEMBER 11. — **Sundridge.** — PAINTING.—For painting four wards at Workhouse Infirmary at Sundridge. Specifications with Mr. Pawley, architect, 1, Suffolk-place, High-street, Sevenoaks.

SEPTEMBER 13. — **Preston.** — PAINTING.—For painting, etc., done at Avenham, Miller, Moor, and Haslam Parks, and Deepdale Enclosure. Specifications seen, and form of tender from the Borough Surveyor, Town Hall, Preston.

SEPTEMBER 17. — **Canterbury.** — PAINTING.—For internal and external painting at the Corn Market. Particulars from Mr. A. C. Turley, A.M.Inst.C.E., City Surveyor, Canterbury.

SEPTEMBER 19. **Cardiff.** — PAINTING.—For the painting of the power-station buildings, car sheds, etc. Specification and particulars from Mr. Arthur Ellis, Central Offices, The Hayes, on deposit of 2l. 2s.

* SEPTEMBER 19. — **Croydon.** — PAINTING, ETC.—The Guardians of Croydon invite tenders for cleaning, repainting, and painting works at schools, Wickham-road, Shirley, near Croydon. See advertisement in this issue for further particulars.

PHASES OF ARCHITECTURAL EDUCATION—
continued from page 290.

occupy the larger part of our time, to the neglect of many other things, and those chiefly artistic. I think you will not cavil if someone insists that we must also be scientific; and you know how absorbing is the science of modern construction. Then what place in all this is left for art? Shall architectural design never be anything but Palladian colonnades? Shall decoration and ornament be ever at the mercy of some clay-puddler in a modeller's shop?

In short, what part is art playing in our profession? Is it merely one of those confounded things after another of which it is said the American's life is composed? Is it for ever to consist of different copies of the splendid motives which Letorouilly has put within our reach, or in touched-up reproductions of the rather mediocre designs of modern European publications? Do you suppose that this great land of ours, which has produced eminent statesmen, writers, orators, and soldiers, cannot also bring forth its Albertis and its Sansovinos? And if they come along, what are we going to do with them; give them their pay by the week, and, as Mr. Cram said yesterday, "force them to sketch themselves into a grave of watery deliquescence"? What part shall the artist play—shall it be a chief and honourable part, or shall it be that of the salaried and, therefore, not independent draughtsman?

There can be but one answer to this: the place of the artist in the practice of

architecture should be second to no other, and to this artist should be opened an education which will enable him to assume that place.

Our architectural schools up to the present have refused to accept this phase of intensive specialisation; twenty years ago they differentiated themselves very little from the schools of civil engineering; to-day they will decline not differentiate the scientific from the artistic in the profession itself; and, though in the scientific branch the instruction is excellent, in the artistic it still leaves much to be desired, and students are not encouraged to choose one or the other on which to concentrate.

The realisation that we had unavoidably passed into this educational phase of intensive specialisation came to me only very recently. It had been my fond notion that all draughtsmen had the ambition to become all-round architects, and ten years ago I had urged Columbia University to open a night school with that end in view. Being unable to pass this measure through at that time, it was with great interest that I saw Columbia last year, at the instigation of our Commission on Education, establish extension courses, which, taken in conjunction with the problems in design of the Society of Beaux-Arts Architects, would give a complete course in architecture. Imagine my surprise, then, when I found that, though the extension courses were well filled, only two of this Society's students were enrolled in them. All these boys were studying to

specialise, each one, in some one branch of architectural practice.

And, after all, is not this quite right? Do we not need in our offices men highly trained in each of the widely-differentiated branches? The sanitary and ventilating experts each up to date with the ever-improving apparatus; the writer of specifications, keenly alive to every new advice for good and economical construction; the landscape gardener, with a minute knowledge of plants and trees to protect the client from the florists' extravagances.

All this we are producing, but what is horrible is that we are rapidly producing, too, an artisan designer, who, in knowledge of plan and of composition, excels the architect, his employer! Just stop a moment to realise what this means. The architect—that is, the man of culture, of affairs, and the gentleman in training to be the artistic inspiration of the architect's office will be the mill, run by a business man, where art occupies a nameless and salaried position. The result of such a condition may have the quality of opportunism, but surely, where the artist is not in authority, his work can never rise to genius.

To my mind there can be but one escape from this condition, and that is to give the man who bears the promise and has the chance of being an architect advantages of artistic training which the night-school man does not get.

At present his training in this is vastly inferior.

We cannot manufacture geniuses, but we can give them opportunity to develop. We cannot develop the genius simply by the T-square and triangle; his every aesthetic instinct must be aroused and given play. Rossetti and Benvenuto did not produce the marvels in Pienza and Florence because they had technique in architectural drawing; but because they were artists, primarily sculptors, and who knows whether they were either gentlemen or men of affairs?

An so I speak to you earnestly to-day at this Convention, where much interest in educational matters has been shown. I speak to you earnestly to urge that everywhere where the higher education of the architect is aimed that it be not restricted to that of the draughtsman, but that he be trained in the practice and observation of the beautiful through every medium.

The technique of architectural drawing is all very well, the principles of planning and the composition of façade are essential, but what is of overwhelming importance is to offer to the genius who may arise the possibilities of developing himself by practice in the three allied arts. Our Universities must admit plastic art in their curricula; they must realise that the artistic side of our profession can only be developed in an art school, or America to the end of time will be unfeelingly and without understanding reproduce Palladian colonnades and XVIIIth-century ornament ad nauseam.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor. All communications must be authenticated by the name and address of the sender, and be sent by post or not. No notice can be taken of anonymous communications. The responsibility of signed articles, letters, and reports read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them. All drawings sent to or left at this office for consideration should bear the owner's name and address written on the face or back of the drawing. Delay and inconvenience may result from intention to this. Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the Editor, who retains the right to reject or of an article, in type does not necessarily imply its acceptance. N.B.—Illustrations of the First Promoted Design in important competition will always be forwarded for publication by the Editor, whether they have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

*. Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

ARCHITECTURAL EDUCATION AND THE LONDON UNIVERSITY.

THE importance of the education of the young architect cannot be too strongly insisted on, the future welfare of architecture and the status of the architect to so great an extent depending upon knowledge. We make no apologies for returning to the subject from time to time, especially in view of the fact that it is to many members of our profession an alien subject, the real bearing of which they may never have thought out.

It has a twofold bearing on the object of an architect's life-work, which we take to be the production of beautiful and logical building; firstly, because, given the same initial ability, the best work must be produced by the man who has most systematically studied his subject, and, secondly, because, without cultivation we cannot hold our own with men of other callings who have the benefit of that culture which we have ourselves neglected. As a nation and as a profession we are proud of calling ourselves a practical people, often forgetting that the best practical results arise from the successful application of sound theories. In France and America this is better understood than in this

country, and the relative superiority of an architect's position in those countries is a direct result of the recognition of the fact that architecture—like all great ennobling and responsible callings—requires knowledge, preparation, and study.

No architect can expect to secure the confidence of a client if the latter ascertains from contact with him that he is devoid of that freemasonry which obtains among educated men. He is likely to be looked upon as a means whereby a certain result may be secured, as a necessary evil to be endured and then thrown aside. It is because their training is in many cases so incomplete that architects' complaints of their clients frequently arise—they are placed at a disadvantage by their ignorance of all but a section of their work.

The great architecture of the past was the outcome of the traditional spirit, in which generations of workers were trained. With the Renaissance came the necessity of study on systematic lines; the great pioneers were men of wide and general learning who were treated by the nobleman and the *savant* as their equals because of their attainments. Even in this country there was a

time when the architect was as familiar a figure at Court and at the meetings of the Royal Society as he now is at the Royal Academy and the societies which dabble in his art. It was left to the last century, that of shams and revivals, to degrade the calling of an architect by classing it with occupations which could be learnt by rule-of-thumb methods till George Eliot expresses, through Adam Bede, the characteristic opinion that a "carpenter with a bit of taste could be relied on where an architect failed." And the work of the few giants who have risen above the failures of their times may serve to emphasise to what low straits an art which is not seriously studied can fall.

It may be safely predicted, by all manner of reasoning, that if we are to leave a record for posterity in our executed work we must make wide and strong the foundation on which we build by thoroughly training those who enter our ranks.

The advantages of a University training for an architect are manifold, and may be briefly summarised. In the first place, it necessitates a good general education, without which the student cannot commence his special studies; it enables

him to get—and from no mean height—a comprehensive idea of what architecture means, a general grasp which is supplemented afterwards by his specialised experience; and, thirdly, it causes him to mix with and hold his own with men destined not only to his own but other professions, and this enlarges his sympathies for and understanding of the great facts of life. Culture has somewhere been defined as the general recollection of what we have forgotten, and the most useful men to a community

are not at all necessarily those who are in possession of the greatest number of facts, but those who are trained in the habit of clear thinking.

These, in brief, are some of the advantages offered by the London University courses at King's College and University College, which at present cannot be obtained at any technical school or isolated department devoted solely to the pursuit of architecture.

The first degree in England for architectural students was instituted at

Liverpool in 1899, under Professor F. M. Simpson, when a B.A. degree (Honours in Architecture) was given. The University College at Liverpool was at that time one of the constituent colleges of the Victoria University, which also included Manchester and Leeds. Manchester followed, and still retains the B.A. degree course unaltered, but Liverpool (now an independent University) the course has been changed, and we hope to revert to the schemes followed there and elsewhere in other articles.

(University of London.)

Sketches by Mr. E. Musmann, B.A.

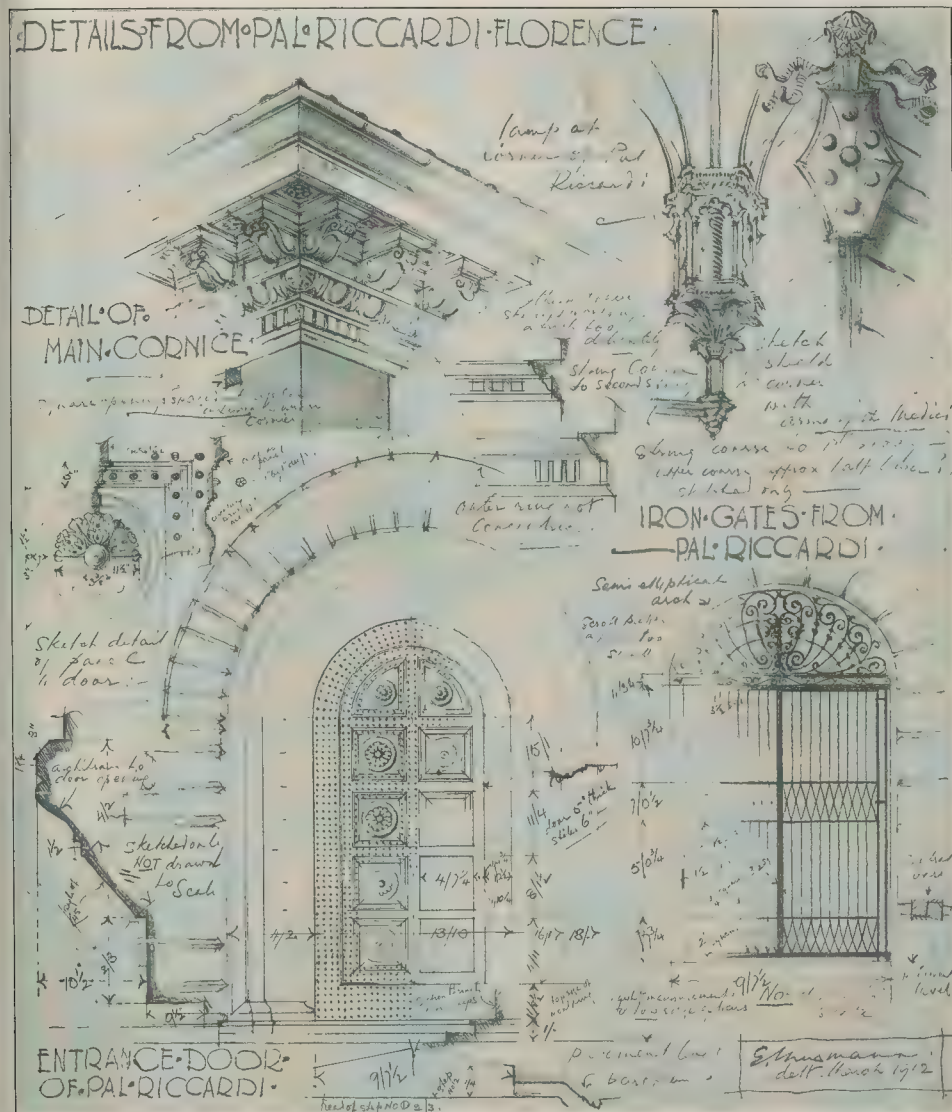

The Degree Course in London was desired many years ago by the late Mr. Arthur Cates, when he was Chairman of the Board of Studies in Architecture of the University, but he died before the scheme was carried through. The regulations of the University made both Greek and Latin compulsory subjects for the Intermediate examination, but some five years ago Greek was made optional, and the degree for Architectural students was instituted under the Chairmanship of Sir Aston Webb, R.A. The course—which is an Honours Course—is a preparation for a B.A. degree. The term "Honours Course" in this case means simply that students take their final examination in one

subject only, as distinguished from a Pass Degree in which several subjects must be taken; it is thus a misnomer, as it would seem to indicate the necessity for a superlative degree of excellence instead of a specialised type of training.

The length of the course is three years (officially described as "two years after passing the Intermediate Examination"). Students are required to pass the Matriculation Examination, but are allowed to enter in October and pass the Christmas following. During the first year students are required to attend lectures in four general subjects for the Intermediate examination which follows at the end of the Session.

A recent decision of the Senate enables students to take exercises in the Classic Orders and the History of Greek and Roman Architecture as one general subject, a great advantage to the architectural student, as part of the first year had previously to be spent in an architectural studio without thus helping the preparation for the Intermediate Examination, whereas under the new regulation the general subjects are reduced to three; the reduction was unavoidable, as the students' first year was otherwise too crowded.

As to the preliminary education essential to negotiating the several stages for such a course, a sixth-form boy at any of the public schools would have

little or no difficulty in passing both the Matriculation and Intermediate Examinations, but unfortunately comparatively few boys who take up architecture are kept long enough at school to reach the sixth forms. In such cases, the Matriculation Examination may need a little special preparation, with which it should be possible for any average boy to pass, as the standard demanded is a fair all-round test of a good education, and not an unreasonably or unnecessarily high one.

With regard to the special subject from which a student can choose for the Intermediate, a long list is given, but two languages are compulsory, of which one must be Latin or Greek. In the past the four subjects usually taken by students have been Latin, French, Mechanics, and Mathematics, but in the future the three first will probably be taken in conjunction with the Orders and the History of Greek and Roman Architecture, as Mathematics is compulsory for the Matriculation Examination, and the standard demanded in it is sufficient for the wants of an architectural student. Mechanics, on the other hand, is insufficiently taught at schools, and a good degree can be obtained at either Oxford or Cambridge by those who are absolutely ignorant of the subject.

To architectural students, however, who will probably have ferro-concrete and other constructional problems to deal with, a good knowledge of mechanics is becoming increasingly necessary.

After the Intermediate Examination the students remaining two years concentrate on professional work, and during these years the young architect's training cannot be based on too broad a basis. When he is in actual practice he will be immersed in detail; the University training should be such as will enable him to grasp the logical and historical basis on which architecture is founded. The development of style, the different way in which the principle of the buttress has been worked out in Northern and Southern France, the bearing and relation of the monastic Orders on the development of church planning and the origin and treatment of domical architecture as influenced by climatic and racial considerations, are instances or points which we can study with advantage, and time for which may never be obtained in after life. The interest which he will feel in such a course of training will largely indicate the fitness or otherwise of the avocation he wishes to adopt. A secondary, but still an important, reason why he should acquire a knowledge of such subjects is that in after life he may be brought into contact with some of the many amateurs or antiquarians possessing archaeological knowledge, and be able to meet them on a common platform.

The studio work during the last two years includes exercises in design increasing in difficulty and essays on different phases of architectural history. The practical side includes demonstrations in the methods of working and using materials, lectures and exercises in Building Construction, and lectures in the Engineering classrooms and workshops, specially arranged with regard

to the needs of the architectural students, and consequently ignoring machinery and purely engineering problems. These are supplemented by practical exercises and the strength and elasticity of materials in the Engineering Laboratories under the staff of that department. Courses on Sanitary Science are also given in the department of hygiene.

These courses obviously bring architectural students into direct contact with those who are taking up other professions. The advantages and broadening influence on both sides are no small factors in the acquisition of that liberal education which a University can alone confer.

There is some misunderstanding among architects as to the nature of the final qualifying examination. It is divided into two parts—practical and written, the former being considered by the examiners to be the more important. The practical examination—really an examination of the use a student has made of his training—includes selections

Sketch from Pont Alexandre, Paris.
By Mr. E. Musmann, B.A.

made from the work of the student for the first two years—constructional exercises, antique and life drawings, architectural exercises and designs, measured drawings, and also a design made from a subject set by the professor and external examiner. As a student he makes the sketch design unaided, and it is then initialled and retained, and he is given eight weeks to work it out and elaborate it. No student can enter for the second or written examination till he has satisfied the examiners in the first or practical section.

The second or written examination deals with the historical side of architecture, and the purely practical, such as Engineering and Sanitary Science. It would be in many cases an advantage if the student had the option of taking this after the first part of the examination, but at present the regulations do not admit of this being done.

Passing this examination does not entitle the student to call himself an architect, but merely to put B.A. after his name in the same way that a student

passing the engineering tripos at Cambridge has a similar right. It will, however, become more and more in the future a sign that a man has had what is almost a necessary grounding in the broad principles which must be thoroughly understood and mastered by those who aspire to do the best work.

We feel that it is particularly opportune that we should give these particulars of the London University course, for new buildings devoted to this important work are now being erected adjoining the Slad School in the grounds of University College, and the new studios for Modelling, Painting, Drawing, and Architecture will practically be under one roof on the completion of the scheme next year. The Engineering Laboratories are on the opposite side of the quadrangle, and here special classes for architectural students in Steel and Iron Construction and the Elasticity of Materials will be held, while lectures in Archaeology, Egyptology and Hygiene will be given in rooms entered from the same quadrangle. In the new buildings, which will afford accommodation for about 120 students, provision will be made for a department of Town Planning and other contemplated developments.

A course on Academic Design, under Dr. J. J. Burnet, has already been inaugurated, and will be thoroughly constituted when the new buildings are completed; and the foundation of Travelling Studentships is in contemplation. In order that some idea of the work already accomplished may be obtained, in connexion with this account of the teaching of the London University, we are reproducing in this issue some of the designs and sketches of Mr. E. Musmann, the first B.A. in Architecture of the University of London.

It will be seen from the foregoing that the organisation for imparting a sound architectural education has already been formed, and we hope will be taken full advantage of by those wishing to enter the profession. A very great advantage of such a course is that it provides a wide and liberal education while at the same time it forms a searching test of a student's suitability for the calling. If after going through it the student elected to enter another calling, he would be the gainer by having had a very thorough general training and a University degree, while if, as in most cases, it had brought out his latent talent he would have obtained a thorough general knowledge which it would be difficult in this country to acquire in any other way. So in either case his time would have been better spent than when, as under the old régime, he would have entered an architect's office direct on leaving school.

In conclusion we might reiterate our conviction that in nothing is the saying "a little learning is a dangerous thing" truer than in its application to the art and practice of architecture.

NOTTINGHAM CITY ARCHITECT.

The agenda for the meeting of the Nottingham City Council on Monday contained an intimation of the resignation of Mr. F. B. Lewis as City Architect. The resignation, it is stated, is brought about by reasons of health.

BRIDGES.

IN a well-written article in its issue of September 4 the *Morning Post* calls attention to the need for better-designed bridges across the Thames. The engineer can successfully deal with subways like that to be opened within a few weeks at Woolwich, but it needs the co-operation of the best architectural skill to secure a fine bridge, and, unfortunately, since Waterloo Bridge (which was built immediately after the battle), all our bridges have been failures in design. With the exception of Waterloo Bridge, there is scarcely a bridge of architectural merit within the confines of London.

And yet few problems admit of greater architectural expression, whether the material be stone or iron. No petty question of accommodation here fetters the designer, the necessary elements are simple—a roadway from bank to bank, supported by girders or arches resting on abutments of satisfactory design, its beauty is enhanced by running water catching every gleam of light at a thousand angles, with craft of all description constantly moving on the waters to add human and pictorial interest to its setting. Nor can a bridge be ever built in or have its beauty destroyed by inharmonious surroundings. It may rise from squalor on either bank, but it crosses the waters between them, eternal in their beauty and interest.

The great Renaissance builders seized their opportunities, and in Italy and elsewhere showed their skill and mastery of design.

Under the régime of Bernabò Visconti, in the latter years of the XIVth century, a bridge was built across the Adda in a single span, 251 ft. wide, while under Gian Galeazzo Visconti the Ticino was bridged at Pavia in the same century by a bridge composed of seven arches, each 70 ft. span and 64 ft. in height, with a roof over the roadway supported on 100 granite columns.

The fine bridge built by the Scaglieri at Verona, and many others, will occur to us, as well as the quaint and picturesque image of old London Bridge, lined with houses on either side, with a chapel dedicated to St. Thomas à Becket in the centre. In modern Paris we have an example of what an iron bridge may become under skilful hands in the Pont Alexandre II., while in this country it would be difficult to point to a single fine modern bridge except such a purely engineering marvel as that spanning the Forth.

There seems no adequate reason why with a new bridge across the Thames we should not have the convenience of covered footways, with their possibilities of architectural expression, and it will be a thousand pities if in St. Paul's Bridge we do not obtain a design of architectural merit.

In abandoning such a field to the engineer the architect loses one of the greatest chances he can ever have of proving that his profession has the power to create the "thing of beauty" which is a "joy for ever," and shows that he is unworthy to carry on the great traditions of the past.

NOTES.

St. George's Hall, Liverpool. WE are glad to hear that the Liverpool Architectural Society have decided to call a public meeting to organise opposition to the Corporation scheme to take down the podium of St. George's Hall for the purpose of constructing flights of steps and placing on the site a memorial statue of King Edward. We have already expressed our hearty agreement with the opinion that the alterations will injure the appearance of St. George's Hall, and we hope that in spite of the vote of the Council in favour of the scheme it is not too late to prevent the proposed work being carried out. It is stated that the opposition is being organised with a view to engaging counsel to represent the objectors at the forthcoming Local Government Board inquiry into the matter.

Architecture and Kingsway.

THE history of the development of the Strand to Holborn improvement, particularly with regard to its architectural character, is so clear an instance of the futility of our present methods in dealing with such works that we welcome any attempt on the part of the daily Press to call attention, as the *Standard* does on the 28th ult., to what should be a cause of regret, not only to architects, but to all who have any interest in London beyond the most selfish individualism or utilitarianism. Here was an opportunity such as seldom occurs, which, rightly seized, might have given us a first-class business street, worthy of English art and skill at the beginning of the XXth century, and an object-lesson in the practical advantage and value of an ordered architectural arrangement and amenity. The Council were at the outset alive to this when, twelve years ago, their Improvements Committee recommended that measures should be taken to secure an harmonious treatment of the buildings in Aldwych and Kingsway. But from various reasons these first steps led nowhere. These reasons may be summed up broadly as the want of sufficiently comprehensive powers for dealing with all sides of the problem, and the lack of the incentive and support afforded by well-informed public opinion. The Press can render good service with regard to arousing and educating this opinion, and when that is done the powers would not long be wanting. From the clearance of the Great Fire, and the failure to adopt Wren's plan for the rebuilding, until this present failure consistently to complete a fine improvement, London has been too much a city of lost opportunities. It is well to be reminded sometimes that she is still a city of splendid possibilities; that, though the old opportunities are beyond recall, new ones are constantly recurring, for London is being rebuilt every day.

Advantages of Architecture.

SO CAREFUL and jealous are we, as a people, of any encroachment upon individual rights and interests that we are apt to forget that an unregulated individualism tends always to defeat even its own ends. We pride ourselves upon being very practical, and yet are led by a very proper regard for sound

balance-sheets into valuing cash more than things that give the cash its value. We even ignore the fact that the architectural amenities of our streets are not only of direct practical effect for good, but may even be a very real commercial asset, whether they consist in the more formal and regular treatment as a whole, which a short, straight street like Kingsway and a crescent like Aldwych demand, or the more picturesque and irregular grouping and composition appropriate to many of the older streets. We have to break down the prevalent fallacy that art is an expensive luxury that does not pay, and we have to reinstate architecture in its true dignity as the great generalising and ordering art, whose true beauty is the final expression of perfected fitness, an efficiency to definite practical ends, both material and spiritual. The causes that make of one street and not of another a good business or shopping centre are in some cases clear enough. In others they are difficult to trace. Sometimes it is nothing more rational or secure than all-powerful fashion. We could not, for instance, calculate or design the causes that have made Bond-street one of the foremost shopping streets in the metropolis; yet we may very safely conclude that its greater neighbour—so much under discussion of late on account of imminent rebuilding—owes much of its popularity to its architectural amenities in being fairly spacious and its buildings designed in a style at least quietly refined and pleasing, and, until quite recent years, harmonious from end to end. We do not suggest that architectural order and beauty should clothe our streets for merely commercial ends, but only that such ends, which we do not pretend to despise, are as likely as those less material to be advantaged thereby.

The New Guildhall Art Gallery.

THE Guildhall Improvement scheme, which involves, among other things, new and spacious galleries for its collection of pictures, has at last materialised; a practicable and interesting solution has been adopted by the City Lands Committee, and it will no doubt receive the approval and sanction of the Common Council. We hope to be able to give in our next issue some illustrations of the plan and elevation which Mr. Sydney Perks, the City Surveyor, has designed; meanwhile it is interesting to note that some critics have suggested that he should have followed the main lines of Dance's "Gothic" façade for the Guildhall. We have ventured to emphasise the term Gothic in regard to its application in connexion with Dance's design, because it has been used in the same connexion by those who would wish to see the two sides of the approximately quadrangular site in question designed in the terms which Dance adopted. But we wonder if these critics have ever looked at the Guildhall front! It is one of the most unique bits of design that has ever been mistaken for Gothic. It is, in fact, composed of elements of a most curiously eclectic character, in which the essential features of Gothic art play the smallest part. The Guildhall front is picturesque; it has an air of civic dignity and antiquity; it is moreover the creation of one

(University of London.)

Design for a Country House. By Mr. Charles Voysey, jun.

of the greatest architects (we have only to recall his masterpiece, the Old Bailey, removed a few years ago) which the XVIIIth century produced. But his façade is not Gothic, any more than it is classic, or Renaissance, or Moresque, although it contains, after a fashion, suggestions of these various manners in architecture. In Dance's time next to nothing was known of Gothic art. The style was not appreciated, and it was still less understood. He was, as one says, "called in" to design the façade of a mediæval building, and he did his best according to his lights and the culture of the time, achieving a result which answered its purpose with a certain dignity and a certain charm, and which remains a testimony of artistic skill applied in an unaccustomed direction. But no modern architect with any knowledge of his art would attempt to place in juxtaposition with the Guildhall façade a building designed on Gothic lines. The scheme adopted by the City Lands Committee frankly departs from Dance's design; it supplies the quieter elements of a quadrangle leading up to the main feature, to the central building, which provides entrance and accommodation for the greatest civic authority which the world has known.

The Architectural Association Curriculum.

THE Architectural Association issue a pamphlet giving particulars of their curriculum for the School of Architecture which has been approved by the Board of Architectural Education, and is based on the

principle that an architectural student should have a preliminary school training before entering an office. The course suggested is one occupying three years at the Architectural Association Day School. The curriculum is framed with a view to students entering the Academy Schools for final training in design, proficient students being admitted at the discretion of the Royal Academy visitors directly into the Upper School. Special classes and lectures are also arranged for advanced students who are preparing for the Final Examination of the R.I.B.A. The course can be extended to a fourth year, in which lectures and classes dealing with professional practice are held, including the London Building Act, dilapidations, light and air, specifications, estimates, contracts and agreements. The first year's course includes studio work in freehand drawing, perspective, and the use of instruments and scales, the elements of the styles, and elementary construction, etc., the accompanying lectures on the history of architecture, construction, physics and geometry; that of the second year is mainly given up to working out simple problems in design, with visits to museums and historic buildings, sketching and measuring, and students must attend such lectures as the master advises. In the third year design studies will be under the direct supervision of Mr. Robert Atkinson. The third year's course is intended to carry the students' training in design and draughtsmanship to a stage considerably in advance of that required for the R.I.B.A. examination.

The fees for the above courses are moderate, and we have no doubt that the Association's work will, as heretofore, be of the greatest use to those entering the profession.

DESIGN FOR A COUNTRY HOUSE.

THIS house is designed on XVIIIth-century lines, the main reception-rooms being on the first floor. In the centre of the ground floor are an entrance vestibule and garden-room or loggia. The offices, kitchen, etc., are placed on the east wing, while billiard-rooms, lavatories, and strong-room are on the west, with communication to the gymnasium or ballroom and the fountain court. The entire south front is taken up by the reception-rooms, which communicate with each other. The north front is the library with access to the loggia on the high level. The bedrooms are arranged in suites on the second and third floors. As to the material, the orders are of stone and the infilling of Italian stucco, with the object of emphasising the architectural features. This design, by Mr. Charles Voysey, jun., was executed at University College.

GENERAL NEWS.

Professional Announcement.

Having been appointed to the Professorship of Architecture at Manchester University, Mr. Archibald C. Dickie has arranged a partnership with Mr. J. Buyers Scott, who has formerly carried on the practice at 23, Old Buildings, Lincoln's Inn, W.C. Both practices will be amalgamated and will in future be conducted under the title of Dickie & Scott, at the above address, and at the University, Manchester.

The Ghent Exhibition, 1913.

For the International Exhibition of next year the authorities will erect a Palais de l'Horticulture et des Fêtes, which will be one-

(University of London.)

Design for a Country House: Entrance Front. By Mr. Charles Voysey, jun.

Design for a Country House. By Mr. Charles Voysey, jun.

(University of London.)

third larger than the Crystal Palace. Special pavilions will be built by France and Germany. The principal British exhibits will consist largely of machinery, tools, and pottery.

Holborn Viaduct.

The City Engineer (Mr. Frank Sumner) has begun another detailed examination of the bridge and its supports, which will be continued from day to day until it is completed. His report will be placed before the next meeting of the Streets Committee, which will be held in about two weeks' time. The City Engineer, it is stated, is unaware of any fresh development or extension of the cracks which were first observed forty-four years ago, but should there be any necessity for strengthening the supports remedial steps will be taken at once.

St. George's Hall, Liverpool.

Mr. Hastwell Grayson, President, Liverpool Architectural Society, has sent a letter to the Liverpool Press, in the course of which he says: The suggestion that a model should be prepared on the basis of Elmes' sketch, showing great pedestals at each end of the podium, surmounted by equestrian statues, was made because of the futility of opposing the official scheme without an alternative. The sketch

is one of many that have been preserved. Obviously from the very commencement the extreme difficulty of a satisfactory finish to the hall from St. John's-lane was realised. The podium was an inspiration which came after much scholarly and careful thought. It is pure art, but because it is not a hotchpotch of art and utilitarianism the public are prone to lose sight of the art. It requires imagination to see that an entrance must be judged by the multitude of those who pass by as well as by the few who enter, and that to form a new approach does not necessarily add dignity. A great building requires a great base. The more majestic the building the greater is the need for massive simplicity in the base.

School of Art Wood-Carving.

The School of Art Wood-Carving, Thurloe-place, South Kensington, has been reopened after the usual summer vacation, and we are asked to state that some of the free studentships in the evening classes maintained by means of funds granted to the school by the London County Council are vacant. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

Town Planning.

At the meeting of the British Association in Dundee Professor Geddes, University College, Dundee, spoke on the needed co-operation of the sciences towards the town-planning movement. He said that a survey was necessary before the preparation of any town-planning scheme could be satisfactorily undertaken. It was to be feared that schemes were in incubation which, whatever their particular merits, were not based upon any sufficient surveys of the past development and present condition of the towns or upon adequate knowledge of good and bad town planning elsewhere. In such cases the natural order, that of town survey before town planning, was being reversed, and in this way individuals and public bodies were in danger of committing themselves to plans which would have been widely different with fuller knowledge, yet which, once they were produced, it would be too late to replace and even difficult to modify. Therefore before proceeding to the preparation of a town-planning scheme it was desirable to institute a preliminary local survey which should take into account the situation, historic development, communication, industry, and commerce, population, and town conditions and requirements.

Design for a Country House. By Mr. Charles Voysey, jun.

(University of London.)

Progress in Housing.

At a recent meeting at Wrexham of the Welsh Housing Association, the Secretary read a letter from Mr. John Burns, in the course of which the writer said: "The return recently issued as to rural housing shows that rural district councils have submitted to me during the past nineteen months housing schemes costing over a hundred thousand pounds, and, as regards urban areas, I observe that loans amounting to close on this sum have been sanctioned during the month ending August 16 last."

Mr. Herbert Lewis, M.P., said that for fifteen years after the passing of the Housing Act of 1890 loans amounting to only 10,500*l.* were sanctioned to authorities for the housing of the working-classes. During the next six and a half years 95,000*l.* was lent, and of that amount about 60,000*l.* related to applications made to the Local Government Board since the beginning of 1911. If to this was added the amount of applications received during 1912 and now under consideration, they got over 100,000*l.* as representing the estimated cost of housing schemes put forward during the last nineteen months. That was twice the amount of the loans sanctioned in the preceding twenty years. With this increased activity in rural housing there had been no falling off in urban schemes. A White Paper just issued by the Board showed that the loans sanctioned for housing schemes undertaken by urban district councils from January, 1910, to the end of October, 1911, amounted to 200,000*l.* Between that date and August 15 last 326,000*l.* had been sanctioned, and of this amount nearly one-third was sanctioned in the last month. The bringing of housing schemes into existence was a matter of great difficulty, but considerable progress was being made. Two schemes had been finally made by local authorities. Authority had been given to thirteen local authorities to prepare or adopt eighteen schemes, and nine applications for authority to prepare schemes were at present before the Board, and there were ten cases in which preliminary notices had been given by local authorities. In all 126 schemes were either well on the way towards completion or in contemplation.

The Selby Abbey Restoration.

The restoration of Selby Abbey Church, together with the rebuilding, through Mr. William Liversidge's munificence, of the south transept, which has been missing for two centuries, has necessitated revision of Mr. W. Herbert Scott's illustrated handbook, "The Story of Selby Abbey: From Rise to Restoration," and a new and enlarged edition—to be known as the William Liversidge Transept Edition—is being published by Mr. Rimmington (Selby) and Mr. David Nutt (London).

The Bristol Society of Architects.

The fourth Saturday afternoon tour of this Society was made to Bath, the members being conducted over the city by Mr. Mowbray A. Green, and a number of buildings were visited. After tea most of the party took the tram to Combe Down, walking down to Prior Park, John Wood's chief work, and thence through the grounds to the Palladian Bridge, and returning to the city by way of Old Widcombe Manor House, the reputed work of Thomas Greenway.

Prehistoric Monuments in Malta.

In the course of the proceedings of the Dundee meeting of the British Association Dr. Thomas Ashby, according to the *Times*, said the British School at Rome had had the advantage during three seasons of co-operation with the Government of Malta in the excavation of several megalithic monuments on the islands of Malta and Gozo. The results of the work showed that these monuments undoubtedly belonged to the neolithic period, or at latest to the very dawn of the age of metals. The pottery was characteristic, and had affinities with wares discovered in Western Mediterranean lands where the megalithic civilisation flourished (Sicily, Sardinia, Spain, the Balearic Islands, etc.), and in remains connected with it or related to it. Not a trace of metal was found in the whole course of these explorations. In Sardinia the School had confined itself to surface exploration. Dr. Duncan Mackenzie, in the course of three campaigns, had discovered a number of dolmens, some of which formed the transition to the "tombs of the giants"—

long tombs used for a number of inhumation burials like the barrows and cairns of our own islands.

Classes in Reinforced Concrete.

Classes for the instruction of engineers and architects in reinforced concrete, to be held at the Northern Polytechnic Institute, Holloway-road, N., start on the 20th inst. for the Session 1912-13. On the 27th inst. Mr. de Vesian, M.Inst.C.E. (Chief of the Hennebique Company), is to give an illustrated lecture, open to the public, on large works recently carried out.

St. Sophia, Constantinople.

It is reported that the glass and cement bands placed over cracks in the mosque of St. Sophia have broken. The tests were begun by Mr. T. G. Jackson, R.A., and Sir Francis Fox about two years ago, and the recent earthquake has developed the cause of the trouble. Unless the building is speedily strengthened collapse is feared.

White Hart Lane Estate.

The Local Government Board in giving its consent to the sale of 49½ acres of this estate at Tottenham suggested that it might be suitable for preservation as an open space provided the local authorities would undertake to share the cost. This suggestion

was discussed between the London County Council and the Urban District Councils of Tottenham and Edmonton, but the local Councils were of opinion that there was no need for further open spaces in this district, and that it was unlikely that they would be willing to contribute towards the cost. The Parks Committee of the London County Council recommend, therefore, that no further steps be taken in the matter, and the land will probably be transferred to the control of the Improvements Committee for disposal as surplus land.

ARMORIAL BOOK-PLATE.

This armorial book-plate has been designed on genealogical lines. The central feature is the heraldic achievement of the owner, whilst the shield immediately below bears his maternal arms. Ranged up on each side in pedigree order are the coats-of-arms brought in by marriage. Those on the right belong to the paternal ancestors, and the shields are placed on a field treated with rose ornament to indicate their English origin. On the left side are the shields of the maternal ancestors who are Irish; the border has therefore been treated with the shamrock. The design is by Mr. Charles L. Pace.

Armorial Book-Plate. Designed by Mr. C. L. Pace.

ILLUSTRATIONS

Port of London Offices.

WITH the reproductions of Mr. Atkinson's design we complete our illustrations of the six schemes sent in for final selection in the competition for the new Head Offices of the Port of London Authority. In the article in our issue of July 19 we said: "Mr. Robert Atkinson submits a scheme having for its main idea an octagonal hall, round which the chief departments are planned, which is entered from Trinity-square and from two entrances in rear, which are diagonally placed. Like everything Mr. Atkinson does, the design is characterised by great care and refinement, but we do not feel that it represents him at his best, the design of the colonnade across the main entrance being especially unhappy."

Mr. Atkinson writes that a genuine effort was made to keep the ground floor as one large hall and to minimise corridors on the upper floors.

Design for a Town Club.

This design for a town club by Mr. E. Masmann was submitted as part one of the final examination of the B.A. degree of the University of London, Honours in Architecture. The conditions as to site, etc., are as follows:—Frontage 100 ft., depth 120 ft., lighting to be secured by means of a central court, side areas, or both. The entrance elevation to face the north and to look on to a main thoroughfare, while that to the south is to overlook a public square. There are adjoining buildings on east and west. Besides the ground and first floor plans, as shown in the illustrations, provision is also made on the second floor for a card-room and top-lighted billiard-room over the smoking-room, while a strangers' smoking-room, a top-lighted library, and a house dining-room face the south. A service-room, lifts, and members' lavatory are also provided on this floor. The third floor consists of bedrooms for members and a terrace over the billiard and card rooms; kitchen, heating arrangements, extra cloak-room, and members' lavatory, etc., are situated in the basement; while a small service mezzanine is provided between the ground and first floors.

COMPETITION NEWS.

A list of current Competitions is printed on page 315.

Royal National Eisteddfod, Wrexham.

As announced last week (p. 283), twenty-nine competitors entered for the premium of 50*l.* offered by the Committee of this festival in conjunction with the Welsh Housing Association. The object of the competition was to obtain designs for workmen's dwellings. The assessors, Mr. T. Taliesin Rees, F.R.I.B.A., and Mr. A. Williams, divided the premium between Mr. W. Eaton, A.R.I.B.A., of Cardiff ("Ivy"), and Messrs. Fair, Myer, & Jones, of London ("Betterment"), whose work was considered to be of equal merit. The names of the other competitors whose work received mention have not been disclosed.

Rangoon Municipal Buildings.

We understand that Messrs. Ogilvy, Gillanders, & Co., agents, Rangoon Municipality, 67, Cornhill, E.C., have been advised by cable from the Rangoon Municipality that the time stated in Clause 14 has been further extended to March 1, 1913. The latest date for posting letters to reach Rangoon by that date will be by the Indian mail closing in London on Friday, February 7, 1913.

School at Dundee.

The President of the Royal Institute of British Architects has nominated Mr. Alexander N. Paterson, of Glasgow, to be the assessor in the competition to be promoted by the Dundee School Board for a school to house physically and mentally defective children.

CORRESPONDENCE.

Architects' and Surveyors' Approved Society.

SIR.—Your readers will be interested to hear that this Society has been approved by the Commissioners, and on their advice applications have come in at a steady rate since the scheme was first put forward, and there is now no doubt that such a Society is wanted.

We append some further information, which it is helpful to give as a result of the large number of letters we have received, and we shall be glad if you will give it publicity in your columns.

Anyone who is in sympathy with the Society, but who does not come under the scope of the Act, may become an honorary member at a subscription of 10*s.* 6*d.* per annum or a donation of not less than 2*l.*, and such subscriptions will be devoted to defraying a portion of the necessary administrative expenses and thereby increasing the benefits available to the members. In this way it is hoped that a community of interest will be established between employers and employees, which is an object everybody will desire to promote.

It is not necessary now that the Society has been approved that the forms of application for ordinary membership should be sent in by September 16, but it is very important that as many applications as possible should be received before October.

Yours faithfully,

F. R. YENBURY (Sec., A.A.).

IAN MACALISTER (Sec., R.I.B.A.).

A. GODDARD (Sec., Surveyors' Institution).

C. MCARTHUR BUTLER (Sec., Society of Architects).

[We take the following from the information referred to:—

"This Society has now been approved and is open to everyone (draughtsmen, clerks, typists, etc.) employed in the offices of architects and surveyors, provided they are between the ages of sixteen and seventy and have not an income of more than 160*l.* per annum.

Pupils who pay a premium and receive a small weekly salary or any payment in return of premium from their employers must be insured. Unpaid pupils need not be insured.

Deposit contributors who do not belong to any approved society can only draw on the money in their account, while members of approved societies receive the following benefits under the Act in return for the same contribution as the deposit contributors:—

Doctor and medicine both free when needed, or a payment instead thereof.

Treatment for consumption.

Sick pay of 10*s.* per week for twenty-six weeks beginning on the fourth day, and disablement benefit of 5*s.* per week so long as necessary.

When the funds of the Society permit additional benefits will be offered, and in the case of those employed in offices where the usual pay is given during illness it is hoped to arrange for alternative benefits other than those provided if the members so desire.

Persons whose income rises above the 160*l.* per annum limit cannot continue insuring under the Act unless they have been a member of an approved society for five years under the Act, in which case they can continue as voluntary contributors, but must pay both the employer's and the employee's contributions.

The question of providing additional benefits in return for additional contributions has not yet been decided, but no doubt if sufficient numbers desire it arrangements will be made accordingly.

The Society reserves to itself the right to require a medical certificate in special cases.

There is no entrance fee and the preliminary expenses of circularising will not be borne by the Society, so that it will not be saddled with a heavy initial expenditure.

Port of London Offices: Ground Plan. Competitive Design by
M. Robert Atkinson, A.R.I.B.A.

It is apparent that a Society entirely confined to professional men and women in safe and healthy employments, with large numbers yearly passing beyond the insurance limit (whose previous contributions may remain in the funds of the Society), should be in a position to offer better benefits than societies of mixed membership.

It is for these reasons that such a society seems desirable in the interest of those employed in architects' and surveyors' offices.

Persons who are already insured in an approved society can before October 15 transfer by giving notice to the Society in writing that they wish to do so. After that date they will have to show a good reason for doing so. Probably the fact of wishing to join a "Professional Society" will be considered a sufficient one.

Those who sign the form already issued signifying their desire to transfer to the "Architects' and Surveyors' Approved Society" will be notified in due course what steps to take."

Hot Water Supply.

SIR,—With your permission I should like to offer a reply to Mr. W. B. Hopkins's letter which appears in your issue of August 30 last.

It is recognised that with what is called the "tank system" of apparatus for domestic hot water supply—the hot storage tank being above the taps, with the tap branches taken from the flow pipe—it is not possible to withdraw all the heated water without having, after about ten gallons has been drawn, some cold water come mixed with it. Notwithstanding this fact, however, the apparatus has done excellent service, and, although seldom erected at the present time, little fault has been found with it as regards the yield of heated water at the taps.

When a tap is opened water comes from every possible direction to issue from the tap, and with a tap on the flow pipe water comes both down from the tank and up from the boiler. Both directions yield the hottest water in the apparatus for a time, but so soon as the contents of the boiler are withdrawn the

water which follows from this direction is cool or cold. Previous to the cool water coming up to the open tap there would be about ten to twelve gallons of really hot water drawn, after which the water issuing from the tap would be mixed cold and hot, not wholly cold.

The foregoing is explained to give point to two important facts—firstly, that of really hot water it is seldom that as much as ten gallons is wanted at once, this water being for the sink, tub, pails, jugs, etc., so that the amount of hot water drawn at once seldom if ever admits of cool water coming up through the boiler. Secondly, with bath water, of which a larger bulk is always wanted at once, if ten or twelve gallons of water at 150 deg. is followed by a good quantity of water at 100 deg. (the mixed hot and cold), the result is quite satisfactory, as even then some additional cold water would be needed to make the whole of bathing temperature.

I am not wishing to defend the old tank system, but rather to explain how it has managed to give a nice degree of satisfaction for so long. As stated, it is seldom erected now, the "cylinder system" having superseded it, yet the most modern type of installation, one that is better than any preceding it, is called the "combined cylinder-tank system," having the advantages of both systems and the disadvantages of neither.

It is to be feared that the plan suggested by Mr. Hopkins, while possible on some occasions, cannot be considered practicable for general use. My house in the near London suburbs is not a large one, but, supposing the tank to be situated in the bathroom, it would, of course, be convenient to the bath and bathroom basin, but the dressing-room lavatory basin would be 40 ft. (run of single pipe) distant, the cloakroom basin 35 ft., scullery sink 40 ft., pantry sink 60 ft., and so on. There are houses in Mayfair and Kensington having the tank system of apparatus in which some of the kitchen offices are undoubtedly 150 ft. (run of pipe) distant from the tank. What might meet the case, halfway, so to speak, would be to adopt Mr. Hopkins's suggestion for all bath

taps (which are usually upstairs) and have ordinary flow pipe branches for other taps. This, however, is not found to be necessary in ordinary experience.

I am sorry it should be stated that "the advice given must frequently lead to failure" for it is quite incorrect to say so.

FREDK. W. DYER.

INTERCOMMUNICATION COLUMN.

Crumbling Brick Wall.

SIR,—I own a semi-detached house about thirty years old, and within the past two years the bricks of the end wall have shown a tendency to crumble. I should be glad to learn of any method whereby this could be checked by means of a coating or other process.

SUBURBAN.

BOOKS RECEIVED.

STRUCTURAL DESIGN. By H. R. Thayer. (London: Constable & Co. 6s. net.)

THE LIVING WAGE. By Philip Snowden M.P. (London: Hodder & Stoughton. 1s. net.)

MODERN SANITARY ENGINEERING. By Gilbert Thomson. (London: Constable & Co. 6s. net.)

FIFTY YEARS AGO.

From the *Builder* of September 13, 1862.

Bayswater.

BEYOND all others this suburb has grown and flourished within the last ten years; for a mile and a half westward of Victoria Gate, by nearly a mile in width, extending northward from Kensington Garden-road, a great and aristocratic town has been added to the metropolis. Six district churches, and more than that number of chapels, have been completed, and are thronged. The arrangement of the houses planted upon this new quarter is a vast improvement upon the old plan of construction; for the mode of utilising and adapting space, particularly in the basement story, gives improved light and air, and increases, at the same time, the convenience and healthfulness of each dwelling.

*** It is a pity that this "vast improvement" to the arrangement of the houses did not apply also to the planning of the streets. Compared with George Gutch's design for the adjacent Paddington Estate executed in 1838—illustrated in the February number of our "Monthly Review of Civic Design" (p. 127)—the general lay-out of this district shows a distinct retrogression. With the exception of Lancaster-gate and the planning of a few of the squares, there is little attempt at ordered arrangement to be found between Westbourne-terrace and Ladbroke-grove.—ED.

NATIONAL PORTRAIT GALLERY.

In the fifty-fifth annual report of the Trustees of the National Portrait Gallery, which was recently issued, a demand is made for the extension of the Gallery by the inclusion of the corner plot immediately to the west of the existing building. On April 3, 1909, the report states, the Trustees provisionally accepted from his Majesty's Office of Works the allocation of a plot of ground then occupied by St. George's Barracks. The rapid increase of the collections makes it imperative that the extension of the building on this site should be put in hand at once. Every possible economy of space has now been effected, but the existing building permits no adequate representation of English historical portraits after the end of the XVIIIth century, with the single exception of the room in the east wing devoted to literary celebrities. Expansion can take place in one direction only, namely, to the westward, towards St. Martin's-street, upon the site formerly occupied by St. George's Barracks. The portion of this ground already allotted to the Board is sufficient for the needs of the moment, but the needs of the future require that the land lying to the west of this plot, and in alignment with it and the present building, should be definitely assigned to the National Portrait Gallery.

MONTHLY REVIEW . of . CONSTRUCTION.

THE MODERN SCHOOL GYMNASIUM: ITS EQUIPMENT AND PLANNING.

I.
THE rapidly-increasing use, in all grades of schools, of Ling's Swedish System of Educational Gymnastics since its adoption by the Board of Education calls for the provision, not only of the special apparatus necessary to the system, but also of suitable gymnasia. In the average school building, till now, no provision has been made for a gymnasium. In a few cases rooms have been provided for the purpose, and in others apparatus has been fitted in rooms primarily intended for other purposes. It is practically certain that the subject of instruction will be given greater prominence in the educational scheme of the future, and that the school gymnasium will come one of the most important features of the building, calling for special attention in planning, construction, and fitting.

Fig. 1.

sams exercise together, thus economising time and avoiding the feeling of showing off which is so embarrassing to backward or sensitive pupils, and which is inseparable from the follow-on system at the horizontal bar. The wall-bars consist of elliptic-section bars, about 1½ in. by 1 in., spaced about 5 in. centre to centre in uprights 8 ft. high. The width of each stall is about 2 ft. 9 in. The uprights are fixed by nails driven into the floor and by holdfasts into the wall. As adjuncts to the use of the wall-bars are stools or benches, either being used according to the preference of the instructor. The stools are ordinary wooden stools, illustrated in Fig. 1, where one is shown placed upside down on a shelf

Fig. 2.

provided for their storage above the wall-bars. These have the advantage that they can be placed at a greater or less distance from the wall-bars in certain exercises to suit the differing lengths of limb in the pupils. They are also most convenient for removal, each pupil obtaining his or her own stool from the shelf and returning it there when done with. The benches are about the same height as the stools, 14 in., and of the length of four or five stalls of bars—11 ft. to 14 ft. When turned upside down they present a rail which does duty for the exercise known as balance-walking. They also have iron hooks on one end, which enable them to be attached to the wall-bars or beams for use in certain other exercises, so that they serve a greater variety of purposes than the stools, but are less adaptable to the individual pupil and are less easily stored.

The double-beam consists of two beams of section, as Fig. 2, about 6 in. by 2½ in., placed one above the other in upright guides, so that they can be adjusted for height, but are held secure against any lateral movement. They are placed across the room and generally reach from wall to wall. They are fitted in a great variety of ways to meet different conditions, but in their most convenient form they are fitted with a centre upright dividing them into two spans. The whole arrangement must be portable, so that the floor can be easily cleared for free-standing exercises. Many ingenious methods of removing the centre upright are in use, in most of which the counter-balance is a prominent feature. Sometimes it is lowered into a trench in the floor, sometimes swung up to the ceiling, sometimes suspended from an overhead rail and run along that to the wall. In the very simplest form of the apparatus, used in barracks, but not to be recommended for school use, the centre upright is carried to its place by hand and set up with stays to the floor.

In a gymnasium equipped for forty pupils there would be two sets of double-beams, which would divide the room approximately into three parts.

The climbing rope is generally the next most important piece of fixed apparatus. There would be ten or twelve ropes hung from a beam at sufficient distance from the end of the room to allow for a clear swing. Inclined climbing ropes, set up by block and tackle, are also used.

Other fixed apparatus, not so essential but extremely useful as soon as the pupils get beyond the elementary stage, are the vertical and horizontal "square" or "window" ladders. The former is a framework made up of squares of about 21 in. by 21 in., four, five, or six squares wide according to circumstances, and the full height of the room. When in use it must stand at least 3 ft. clear of the wall and be bolted firmly to the floor. Sometimes it is hung on overhead rails, which enable it to be run bodily backward to the wall; sometimes it is hinged at the head and merely swung back at the foot. The horizontal square

ladder is similar in construction, but is only three squares high—width according to convenience. It is also fixed in a variety of ways. The arm ladder is in two parts, one standing upright against the wall, the other made fast to it by sliding grips, so that it can be brought forward and rested on the beam in the position shown in Fig. 3.

II.

The planning of a gymnasium must necessarily be affected by many different considerations, as to expense, situation, combination with other parts of a school, etc., and possibly many things which would be looked upon by an enthusiastic instructor, as essential may have to be cut out by the "powers that be." But the time has passed when any space which did not happen to be otherwise utilised was looked upon as being good enough for a gymnasium and as requiring no special adaptation. It is safe to predict that in a few years' time the gymnasium will be looked upon as at least equal in importance to the chemical and physical laboratories on the planning and equipment of which so much money and thought is expended nowadays.

The main requirements of the ideal gymnasium are as follow:—A detached building is desirable, in order to obtain the maximum amount of light and ventilation. The room ought to be at least 40 ft. long by 20 ft. wide and 14 ft. high. The size which is most frequently recommended is 50 ft. by 25 ft. by 16 ft. The windows should be set high, above the tops of the wall-bars, and should run practically all round the room. Ample scope for ventilation should be afforded, not by means of a few little hoppers, but by casement frames, which will admit of all windows being thrown completely open on a summer day. Draughts are guarded against by the fact that the windows are so high. The floor should be boarded in the ordinary way and should lie on joists—not on concrete. A certain amount of spring is absolutely necessary. Hard wood and parquetry are unsuitable and concrete absolutely taboo. The boards should be laid across the room, their joints thus affording some safeguard against slipping in running and jumping exercises. This arrangement also ensures more equal wear than when the boards are laid lengthwise. The floor should be oiled by two or three coats of linseed oil to render it dust and waterproof. The oiled floor is wiped over with a wet swab between lessons to remove dust and dries in a few minutes. Many of the exercises are performed by the pupils in a sitting or prostrate position on the floor, and cleanliness is therefore imperative. Varnish

Fig. 3.

and the usual floor polishes are unsuitable as producing a slippery surface.

The wall-bars are arranged along the sides of the room, so that the teacher, standing at the end of the room, may see at a glance whether the pupils are performing the exercises correctly.

In some buildings the floor is so designed that a small trap-door in front of each stall of the wall-bars can be lifted and the stools put down below the floor in a position instantly accessible and quite out of the way.

The position of beams and climbing ropes has been already suggested. Where the double-beam is fitted to lower into a trench below the floor this trench has to be arranged for. It must be damp-proof, as any damp will warp the beams and prevent their working freely in the grooves of the uprights, may be lined with wood, concrete, or asphalt, and must be about 1 ft. wide. The depth varies according to the design of the apparatus.

The only entrance to the gymnasium should be through the dressing-rooms, so that all outdoor garments and boots or shoes and with them all wet or dust may be left there. Dressing-rooms are most conveniently placed at the ends of the building, so that the side walls, required for wall-bars, may not be broken up by doors, and should be fitted up with lockers and particularly with shower baths.

Provision will have to be made in the roof for the suspension of ropes and ladders, and possibly for the travelling uprights of beams. (Beams with suspended uprights and counter-balance weights are strongly to be recommended as most suitable for school use.)

By a little consultation between the architect and the maker of the apparatus a certain amount of ornamental feeling, sadly lacking at present, can easily be obtained in parts of the apparatus, removing much of its uncompromising nature and enabling it to appear more as part of the building and less as an ill-considered addition. The red pine of which the apparatus is made is, of course, capable of being stained a darker colour, removing the feeling of cheap, temporary construction, which is, to some people, inseparable from light-coloured wood.

REINFORCED CONCRETE SILO AT THORNABY-ON-TEES.

The site of this silo is at the Cleveland Flour Mills, Thornaby-on-Tees, near the River Tees. A concrete raft foundation carries the silo proper. The number and sizes of the bins are approximately as follows:—No. 12 bins, size 12 ft. by 12 ft. and 80 ft. high; No. 12 bins, size 6 ft. by 6 ft. and 80 ft. high. The total weight of grain in the silo bins is about 4,000 tons, which may be unequally distributed, one bin being full whilst all the surrounding bins are empty, or one outside row being full whilst the others are empty, so that each bin is practically self-contained and is reinforced to maintain throughout its full height perfect rigidity when full of grain irrespective of all adjoining bins.

The thickness of the reinforced concrete wall is 5½ in. for the large bins and 4 in. for the sub-divisions forming small bins. Outer walls 8 in. in thickness, with additional thickness at pilasters, parapets, etc. Over the tops of the bins a floor 4½ in. in thickness is constructed, with all necessary openings for shoots, man-holes, etc., being formed in the same.

The architects were Messrs. Gelder & Kitchen, F.F.R.I.B.A., of Hull, and Mr. E. P. Wells acted as consulting engineer. The work has been carried out by Messrs. the Stuart's Granolithic Company, Ltd., Fenchurch-street, E.C.

STEEL FRAME OF THE WOOLWORTH BUILDING.

The main portion of the Woolworth Building, now under construction in New York (illustrated in our issue of May 26, 1911), encloses three sides of a light court measuring 95 ft. by 37 ft. in plan, and will be about 400 ft. high from street level to the main roof, above which the tower will rise to a further height of 400 ft.

For the support of the sixty main columns destined to receive the weight of the entire building foundation piers of concrete have been carried 40 ft. down to solid rock.

Upon the piers are steel grillages and distributing girders and cantilevers. The grillages consist of heavy I-beams laid in two or more tiers, according to the load to be carried, and embedded for protection in 1:2:4 Portland cement concrete. The distributing girders extending from pier to pier were laid in trenches before the general excavation was carried down to the same level.

To furnish some idea as to the duty of these members we may say that one of them, designed for supporting one of the tower columns, representing a load of 4,250 tons, measures 5 ft. 9 in. wide by 8 ft. deep by 23 ft. long, and weighs 58 tons.

Seven girders of the same dimensions and weight are included in the foundations, the other distributing girders weighing from 22 tons to 27 tons each.

Steel for the superstructure was sent from the works of the American Bridge Company to the goods depot of the Pennsylvania Railroad at Greenville, New Jersey, where it was sorted and dispatched to New York in lighters as required, being transported through the streets on special lorries.

The largest column section delivered on the site measures 30 ft. long and weighs 40 tons. The average weights of the columns are as follows: First tier, 40 tons; second tier, 33 tons; third tier, 31 tons; eighth tier, 15 tons; fourteenth tier, 12½ tons; main roof, 10 tons.

On August 11, 1911, the first grillage beams were delivered, and on September 15, 1911,

the first foundation girders were received, the first columns arriving ten days later, and the first consignment of steel for the superstructure coming to hand on October 20, 1911.

On the last-mentioned date the first columns were erected, and by the end of November the steel frame had been constructed up to street level.

By April 6, 1912, the frame had been carried up to the height of the main roof, the structure to that level including thirty stories and about 17,000 tons of steel.

The work of erection was performed by four derrick gangs of eight men each, who were able to complete two tiers per week, and whose record was 1,153 tons of steel erected in 10 consecutive days of eight hours each.

It is interesting to record the fact that although the contract conditions required the whole of the steel to be erected by July 15, 1912, this part of the work was practically finished the end of June.

The construction plant provided for erecting the superstructure included four steel girders, with the lifting capacity of 30 tons each, and one timber guy derrick of 15 tons capacity.

These derricks commanded the entire site and the adjacent street. Consequently they could be employed for unloading lorries as they delivered the steel to required positions in any part of the building.

The large amount of riveting necessary for the steel frame was performed by twenty

Reinforced Concrete Silo at Thornaby-on-Tees.

Messrs. Gelder & Kitchen, F.F.R.I.B.A., Architects.

gangs of four men each, by whom about rivets were inserted per day of eight hours, the aid of pneumatic riveting hammers. The riveters were followed by a gang of fifty-five painters, who applied two coats of oil to all the steelwork.

BOYS' SCHOOL, STRAND-ON-THE-GREEN.

A new school for 420 boys has been erected by the Chiswick Urban District Council at Strand-on-the-Green. About 2,800 sq. yds. have been covered, the school occupying but 440 sq. yds. The playground has been laid and tar-paved for an area of 1,850 sq. yds., about 510 sq. yds. have been left for the boys' gardens.

The whole area has been enclosed by solid climbable iron railing, but double gates have been fixed for the admission of the fire escape and it be required. The existing southern wall will form the main entrance for boys. The covered playground at present forms part of the school, but should the same be required for open-air classes, an additional covered playground at the ground level may be added.

The whole area is drained by gullies only at the sides, thus leaving an even and unbroken face for games. The heating chamber and boiler store, which forms the only basement, is divided with a fixed semirotary pump for lifting all waste or rain water to the general drainage level.

Lavatories are provided in the headmaster's room (for use during medical examination) and in cloak-rooms on mezzanine and ground floors, which discharge into the foul-water main in Brook-road. One master's and two additional boys' water-closets have been provided, with extra urinal accommodation, whilst two "Purita" fountains placed outside the school provide a continuous supply of drinking water.

The walls are of stock bricks with red brick dressings and blue brick plinth, all below main-proof course being in cement mortar. The roof is of wood construction, covered with boarding, felt, and best Broseley tiling.

The internal surface of the walls to the staircase is finished with brown salt-glazed bricks, which material also forms a dado 4 ft. high on both floors, the remaining surface being stemped. The thresholds and steps are of dark stone, whilst the window-sills are made of blue brick blocks, and arches of rubbed brick with Portland keystones. Bull-nosed eaves are provided both externally and internally at all projecting angles.

The windows in all walls are formed with steel casements, with hopper openings for prevention of draught and better ventilation. This type also gives a maximum amount of light for the size of the opening. The borrowed light is similarly of steel construction and is made to open for cross ventilation.

The floors to classrooms are of steel and concrete, finished with 1½-in. pitch-pine boards laid to herring-bone pattern, whilst the staircase is ferro-concrete and the cloak-rooms and corridors are all finished with

Boys' School, Strand-on-the-Green, Chiswick.

Mr. Edward Willis, Architect.

granolithic paving. Blue brick paving is adopted in the basement.

In addition to the ordinary windows, extra ventilators are provided to all classrooms, four opening direct into the external air and four discharging through a ventilating turret about 40 ft. high. Fanlights are fixed to the classroom doors, and at all times cross-ventilation in either direction is possible.

The heating of classrooms, lavatories, corridors, etc., is effected by a low-pressure system regulated automatically, with sectional boiler in the basement and radiators in all classrooms, etc.; the master's and assistant masters' rooms are warmed by open fires.

The artificial lighting throughout is by means of gas, inverted incandescent mantles being used in classrooms and plain guarded burners in corridors.

All rooms are provided with the Magneta Time Company's clocks, and the four faces of the ventilating turret have been provided with dials worked by the same master clock in the headmaster's room. A special pendulum fire alarm and telephone is fixed in the ground-floor corridor at the foot of the staircase, ringing direct to the fire-station. The turret, chimney-stacks, etc., are protected by lightning conductors connected to copper earth plate on the southern side.

The building comprises two floors and basement heating chamber and coal store. The ground floor includes bicycle store, three classrooms for forty-eight and two for sixty boys, with lavatories and cloak-room accommodation.

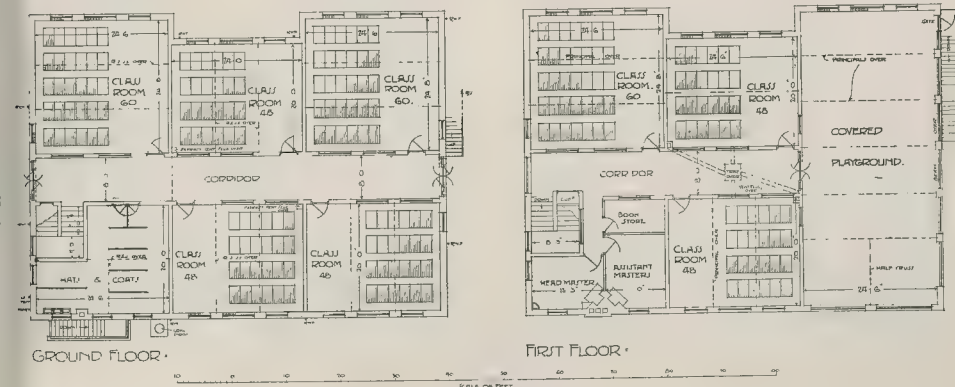

The first floor has only one classroom for sixty boys and two for forty-eight, making 420 as the total present school accommodation. There are separate rooms for the headmaster and assistant masters, with large book store and extensive covered playground, approximately 1,800 sq. ft. in area, which could be used if desired for open-air classes, and from this is an iron and steel escape staircase to the general playground.

The lavatory and cloak-room accommodation for first-floor scholars is on the mezzanine floor. The design was prepared by Mr. Edward Willis, Assoc. M.Inst.C.E., etc., Architect to the Education Committee, and the contract was carried out under his supervision by Mr. W. J. Maddison, of Canning Town, Mr. J. Empson being the clerk of works.

It is anticipated the final cost of the building will not exceed 5,000l., or about 12l. per school place.

COW-STABLE FOR EMIGRATION TRAINING FARM.

A new cow-stable has recently been built for the Hon. Rupert Guinness, G.B., C.M.G., M.P., at Park Farm, Woking, Surrey. It forms an addition to the buildings already erected, and is equipped with modern appliances for instructing and training young men who intend farming in Canada and the Colonies. The building has been planned on the latest Canadian

Boys' School, Strand-on-the-Green, Chiswick.

Mr. Edward Willis, Architect.

lines and fitted almost entirely with Canadian fittings, such as cow-stalls, loose boxes, calf pens, etc. It is constructed with red brick plinth. The external framing above the sill is weather-boarded. The interior is lined throughout with asbestos sheeting, including the ceiling. The roof is covered with red sand-faced tiles. The floors throughout are of 2-in. granolithic laid on a bed of concrete. Special care has been given to lighting, ventilation, heating, and drainage.

The building has been designed by Messrs. T. H. Roberts-Wray & J. A. Hale, architects, of John-street, Adelphi, W.C. The contractors were Messrs. Kirk & Randall, of Woolwich; the heating and dairy fittings by Messrs. Burnard & Co., of Vauxhall.

VENTILATION.

In his address before the Physiology Section of the British Association meeting in Dundee, Mr. Leonard Hill, the President of the section, discussed the conditions necessary to the maintenance of a healthy body, and controverted the common assumption that the air is made deleterious to health by the introduction of chemical impurities. In the course of his remarks he said that everyone thought that he suffered in an ill-ventilated room owing to some change in the chemical quality of the air. The alterations in chemical composition of the air in buildings where people crowded together and suffered from the effects of ill-ventilation had nothing to do with the causation of these effects. Satisfied with the maintenance of a specious standard of chemical purity, the public had acquiesced in the elevation of sky-scrapers and the sinking of cavernous places of business. Many had thus become cave-dwellers, confined for most of their waking and sleeping hours in windless places, artificially lit, monotonously warmed. The sun was cut off by the shadow of tall buildings and by smoke. The bracing effect of cold was of supreme importance to health and happiness. We became soft and flabby and less resistant to the attacks of infesting bacteria in the winter, not because of the cold, but because of our excessive precautions to preserve ourselves from cold, and the prime cause of "cold" or "chill" was not really exposure to cold but to the over-heated and confined air of rooms, factories, and meeting-places.

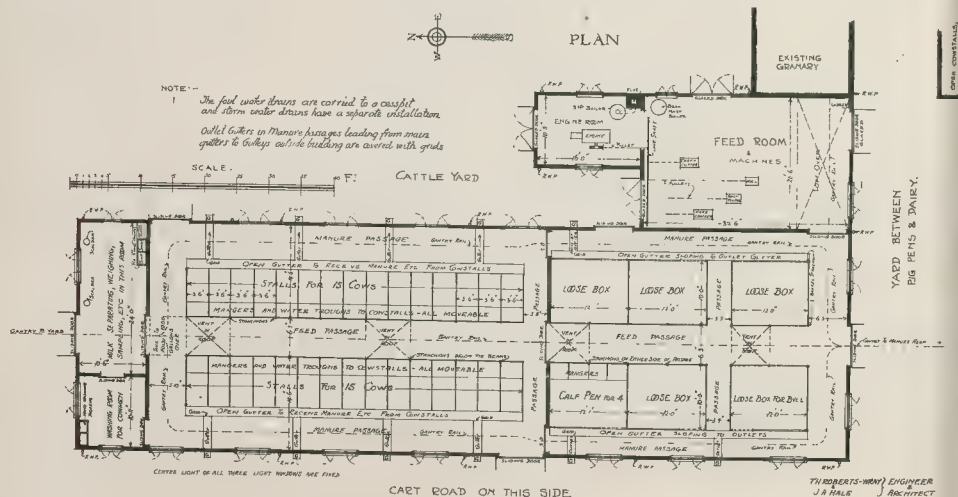

He recently investigated the case of clerks employed in a great place of business, whose working hours were from nine to six on three days and seven to nine on the other three days of each week. These clerks worked in a confined space—forty to fifty of them in 8,200 cubic ft., lit with thirty electric lamps, cramped for room, and overheated in warm summer days. It was not with the chemical purity of the air of such an office that fault

was to be found, for fans and large openings ensured this sufficiently. These clerks suffered from their long hours of monotonous and sedentary occupation, and from the artificial light, and the windless, overwarm, and moist atmosphere. What was the use of the State spending a million a year on sanatoria and tuberculin dispensaries, when those very conditions of work continued which lessened the immunity and increased the infection of the workers? In the last few years the rush and excitement of modern city life had increased, together with the confinement of workers to sedentary occupations in artificially lit, warm, windless atmospheres. The same conditions pertained to places of amusement, eating-houses, and tube railways. Central heating, gas-radiators, and other contrivances were now displacing the old open fire and chimney. The change greatly improved the economical consumption of coal and the light and cleanliness of the atmosphere. But, in so far as it promoted monotonous, windless, warm atmospheres, it was wholly against the health and vigour of the nation. The open fire and wide chimney ensured ventilation, the indrawing of cold outside air, streaky air—restless currents at different temperatures, which struck the sensory nerves in the skin and prevented monotony and weariness of spirit. The height of houses prevented the town-dweller from being blown upon by the wind. He worked, ate, and was amused in warm, windless atmospheres, and suffered from a feeble circulation, a shallow respiration, a disordered digestion.

The widespread belief in the presence of organic poisons in the expired air was mainly based on the statements of Brown Sequard and D'Arsonval, statements wholly unauthenticated by the most trustworthy workers in Europe and America. These statements had done very great mischief to the cause of hygiene, for they led ventilating engineers and the public to seek after chemical purity and neglect the attainment of adequate cooling and movement of the air. The efficiency of workers in mills, mines, tunnels, stockholes was vastly increased by the provision of sufficient draught of cool and relatively dry air, so as to prevent over-taxing of the heat-regulating mechanism. The electric fan has vastly improved the conditions of the work in the tropics. He would suggest that each clerk should have a fan just as much as a lion on his desk. It would pay the employer to supply fans. All the efforts of the heating and ventilating engineer should be directed towards cooling the air in crowded places as cooling the bodies of the people by setting the air in motion by means of fans. They have a very great inherent power of withstanding exposure to cold. The bodily mechanism became trained and set to maintain the body heat by habitual exposure to open-air life. The risk lay in over-heating our dwellings as over-clothing our bodies, so that the mechanism engaged in resisting infection became enfeebled and no longer able to meet the sudden transition from the warm atmosphere of our rooms to the chill outside air of winter. The dark air

adequately ensured by attendance to the
entials.

BRITISH STANDARD SPECIFICATION FOR STRUCTURAL STEEL FOR BRIDGES, ETC.

A new edition of the British Standard Specification for Structural Steel for Bridges (General Building Construction (Report 15, revised August, 1912) has recently been issued. The new issue is of importance in view of the fact that the London County Council (General Powers) Act, 1909, requires that all rolled steel used in the construction of skeleton-frame work for buildings shall comply with the requirements of this specification.

Since its first issue in June, 1906, the Committee from time to time had brought before it points which had arisen in connexion with its use, and the present issue embodies necessary amendments in regard to these. The more important modifications in the specification are as follows:—

The classification of the material dealt with into two categories, A Steel and B Steel.

The increase of the allowable Phosphorus content in B Steel from .07 to .08 per cent.

The increase of the upper limit of tensile strength for plates, sections, and bars (other than rivet bars) from 32 to 33 tons per square inch.

The reduction of the lower limit of tensile strength for rivet bars from 26 to 25 tons per inch.

The insertion of clauses dealing with (a) tests by an independent expert, (b) rejection or delivery, and (c) arbitration in cases where it is not otherwise provided for.

Following the procedure adopted in the revision of the British Standard Specification for Portland cement, the text of the specification has been settled in consultation with the Committee by Mr. A. A. Hudson, K.C. (standing counsel to the Committee), with a view of making it as far as practicable it has the same meaning intended by them, and the specification has been remodelled in accordance with his advice.

The specification may be obtained from any bookseller or from the Offices of the Committee, 1, Victoria-street, Westminster, S.W., and published for the Committee by Messrs. J. & W. Lockwood & Son.

CONSTRUCTION NOTES.

Metallic Filament Lamps. RECENT investigation, including microphotographic study of "drawn-wire" and "extruded" filaments for electric incandescent lamps, has demonstrated the fact that the continued high temperature at which such lamps are made has the effect of causing crystallisation of the metal. The larger crystals which are chiefly responsible for fracture of the filaments appear to be built up by accretion upon the original crystalline formation in the original structure of the metal. Drawn-wire filaments having finer initial crystallisation are stronger than extruded filaments, and as indicated by an investigation mentioned remain so until the metal has become crystallised, a process obviously requiring more time than that involved in the crystallisation of extended filaments.

Vibration on Effect of WITH the object of obtaining data as to the relative merits of incandescent electric lamps, a series of tests has been conducted in the Argentine Government Navy Laboratories, with special regard to the capacity of the filaments for resistance to shock and vibration.

The tests were applied to four well-known makes of metallic filament lamp and also to a standard carbon filament lamp.

The results, showing the length of time which the lamps were able to withstand "severe vibration" before failure of the filament, were as follows:—

Metallic filament lamp No. 1, twenty-five minutes; metallic filament lamp No. 2, thirty minutes; metallic filament lamp No. 3, forty-five minutes; metallic filament lamp (Madsen drawn-wire), 140 minutes; carbon filament lamp, thirty-five minutes.

PROFESSOR BORCHERS, of Aix-la-Chapelle, has recently announced the possibility of producing alloys of iron capable of resisting attack by acids, and remaining amenable to ordinary methods of treatment and manipulation in the workshop.

The new alloys are prepared by adding from 2 to 5 per cent. of molybdenum to an alloy of ferrochrome containing very little or no carbon, and not less than 10 per cent. of chrome. An alloy containing only 36 per cent of iron as against 60 per cent of chrome and a small proportion of molybdenum has been found to be insoluble in boiling aquafortis, while possessing all the essential qualities of iron and being suitable for working in the ordinary manner.

MR. H. E. KIEFER, in the *Soundness Journal of Industrial Engineering Chemistry* for 1912, describes tests and their results which show that the presence of free sulphurous lime cannot be the sole cause of the failure of certain samples of Portland cement to pass the boiling test.

H. le Chatelier has stated that the addition of 1 per cent. of freshly-calined lime to a sound cement will render it unsound, but in the author's experiments finely-ground lime was added in relatively large quantities, in one case up to 25 per cent., to samples without rendering them unsound. In all the cases tried, the quality of the cement was improved by finer grinding or by removing the coarser particles by sifting.

In other experiments in which the unsound cements were exposed to moist air at 150 deg. Fahr., the absorption of from 0.1 to 0.27 per cent. of moisture sufficed to render the cements sound. It was found that when cement is allowed to stand, either in a sealed jar or exposed to the air, the coarser particles become progressively finer, and it is considered probable that the seasoning of unsound cement consists in the disintegration of the coarser portion. In this coarser portion free lime may be present encased in glassy particles, and the disintegration be caused or accelerated by heat and moisture. It has been found that the moisture need not be in sufficient quantities to hydrate the free lime, but merely to render the coarser particles sufficiently fine to permit hydration before the cement has set.

Tests conducted with the "Steam-Cured" object of determining the effect of high-pressure steam on the strength of cement mortar, show that the process of hardening is accelerated, and the compressive resistance of the material is proportionate to the pressure of the steam and the duration of the exposure. The tests also indicate that for steam curing the mortar should be of medium consistency, which is better than a very dry or a very wet consistency. Another point to be noted is that the mortar should have developed initial set before being treated with steam.

ACCORDING to Mr. G. Hentschel, in an article printed by the *Tonindustrie Zeitung*, the rate of setting of Portland cement is accelerated by the addition of alkaline carbonates. On the other hand, the addition of varying proportions of calcium sulphate retards the process of setting. The writer recommends that the catalytic effect of compounds such as those mentioned should be determined by comparative experiments.

Sodium and potassium carbonates exert an extraordinarily strong positive effect, while calcium sulphate has a relatively smaller negative influence. It is stated that the positive effect is more strongly marked in the case of finely-ground cements.

Setting Properties of Portland Cement.

Setting Properties of Portland Cement.

Setting Properties of Portland Cement.

In the process of burning any alkali present in the raw materials is converted into an alkaline silicate which has no influence on the rate of setting, but after exposure to the air the silicate is slowly decomposed into silicic acid and carbonate, especially with the assistance of heat.

The pronounced effect of carbon dioxide and heat is stated as an explanation of the fact that rotary kiln cements change more readily than cements prepared in ordinary kilns, and often leave the mill in a quick-setting condition.

Steel and Wrought-Iron Pipes.

Now that steel tubing is coming into more general use for steam and water, the subjoined notes may be found of service to our readers in enabling them to determine by inspection whether the tubing employed on any work is of steel or wrought-iron. Steel tubing is relatively smooth, and any scale on the surface appears in the form of small blisters, revealing a smooth and whitish surface on being scraped away. On the other hand, wrought-iron tubing is rough, lacking the perfect finish of drawn-steel tubing, and scale occurs in heavy flakes. Steel tubing can be flattened considerably without splitting, while iron tubing tends to open at the longitudinal weld. If broken, steel tubing shows a fine crystalline fracture, and iron tubing shows a jagged fracture indicating the fibrous nature of the metal.

United States Government Specification for Portland Cement.

In June, 1911, a Committee of Government engineers was appointed for the purpose of unifying the specifications for Portland cement used by the United States Government. After first arriving at a tentative specification, the Committee conferred with representative manufacturers and users of Portland cement and with the special committees of various engineering societies by whom the same question has been considered.

As a result of such conference the tentative specification was modified until substantial agreement was reached on all points except the methods of determining the normal consistency and time of setting.

An order signed by President Taft has recently been issued requiring that the specification as modified shall apply to all Portland cement purchased by or used in construction work connected with any department or branch of the United States Government.

It is recognised, however, that no specification can be regarded as final. Consequently the order provides that the specification may be modified from time to time by a departmental conference with the approval of the heads of the several departments.

Aluminium in Brass Castings.

THE effects of adding aluminium to brass is to make the castings sounder and remarkably free from pin holes, while the metal runs better, and the castings come out of the sand very sharp and clean. According to the *Brass World*, the best method of adding the aluminium is first to make an alloy consisting of aluminium 1 part and zinc 3 parts, adding this alloy to the brass just before pouring. The proportion of aluminium required is very small, and the addition of too much makes the castings hard and apt to shrink considerably on cooling.

Physical Properties of Concrete.

A MOST useful investigation now in progress by the National Bureau of Standards (U.S.A.) is one for the determination of the physical properties of concrete. At the suggestion of engineers and others interested in the subject, the Bureau have decided to inquire into the causes of cracking in concrete structures and the question of expansion and contraction joints.

For the purpose of the inquiry, reference marks have been placed upon typical old and new concrete work in Wayne County, Michigan, at Greenwich, Connecticut, and on the lock walls and elsewhere on the Panama Canal works.

Measurements will be taken from time to time during summer and winter to determine the expansion and contraction due to temperature variations, and to ascertain the changes of volume taking place during the hardening of the concrete.

THE BUILDING TRADE.

THE TRADE UNIONS CONGRESS.

THE proceedings of the Trade Unions Congress were commenced at Newport on the 2nd inst., under the presidency of Mr. William Thorne, M.P.

The address of the President bore a strong likeness to other Presidential addresses delivered on like occasions. Many of the leaders of the trade unions are men who are opposed to the existing order of things and who advocate the nationalisation of the means of production and distribution of wealth, and who see salvation in the suppression of the capitalist and the employer. If, however, they are convinced of the soundness of their views it is somewhat surprising that they never elaborate their policy. Year after year the same views are expressed in almost the same periods, but no attempt is made to explain a policy which involves changes of such magnitude, and the rank and file must be acquiring a shrewd suspicion that their leaders' reticence may be due to the impossibility and impracticability of the schemes which they put forward. Mr. Thorne in his address followed very much the conventional lines, and little is to be gained by such statements as that land and labour are the foundation of all riches and that the increase in wealth is not due to the capitalist class. The proprietor of the very smallest plot of land could instruct Mr. Thorne on the use and necessity of capital. Again, in discussing the distribution of wealth, what can be more misleading than to take the gross assessment for income tax in this country and compare it with the wages paid also in this country? Quite apart from the distinction between capital and wages, it must be remembered that owing to the action of the trade unions and to certain legislation, or threats of legislation, capital is invested abroad, and the foreign pay-sheets do not figure in this country, though much of the income produced abroad comes home to be assessed. Unreliable as is Mr. Thorne's comparison, the figures he quoted might have been very different if during the past twelve months there had been no railway strike, no coal strike, and no transport strike, and if nearly 39 million working days had not been lost in the first seven months of this year.

The President expressed himself opposed to any scheme of compulsory arbitration and as dissatisfied with the Trade Unions Bill, and in the latter connexion his observations as reported are somewhat remarkable. He claimed unlimited political powers for the unions, but his ideas of political powers appear to be to obtain control of the Army and Navy and the civil authority, so that they should not be used in the case of strikes. We venture to think that such an attitude is most damaging to the cause of trade unionism. The legality of strikes is fully recognised; not only are they legalised, but peaceful persuasion is allowed, and no action for tort can be brought against a trade union. Political action on the part of the unions is now being recognised by this Bill as well, and even the rights of minorities who do not favour the political policy adopted by the unions are very inadequately safeguarded. This being the state of the case, what deduction can be drawn from such observations as we have referred to above but that the unions, as represented by certain of their leaders, desire to be free to resort to intimidation, as that in connexion with strikes is the only thing which remains illegal and which calls for civil or military intervention? The patience of the public has been sorely tried in the recent strikes; the sympathetic strike does not invoke any sympathy from the public, which sees in its intimidation directed against itself; intimidation of non-unionists is distasteful to those with a sense of fair play, and the trade unions, if they wish to retain the extraordinary privileges already granted to them, will be wise if they emphatically dissociate themselves from and strongly condemn the acts of violence and coercion which are illegal and which have marked some of the strikes. On the last day of the Congress we regret to see that a resolution was passed by a large majority on a card vote declaring that in the interests of trade

unionism, and with a view to securing the full benefits of awards and agreements fought for, trade unionists should refuse to work with non-unionists.

The debate on the question of the Trade Unions Bill was unusually interesting. On a card vote a resolution was passed by a large majority to oppose the Bill in its present form, as the Congress claimed complete political freedom. The Bill recognises the right of unions to engage in political activity, thus practically overruling the Osborne judgment, and the only limitations it contains are (1) that the Registrar of Friendly Societies shall be satisfied that the principal objects of a union are the "statutory objects," i.e., the objects defined by the Trade Unions Amendment Act, 1876, the regulation of the relations between workmen and masters, etc., and that the unions are not purely political societies; (2) that the political objects must be approved by a majority of the members voting on a ballot; (3) that payments for political objects shall be made from a separate fund; (4) that members shall be at liberty to give notice that they do not desire to contribute to the political fund.

This is a brief summary of the measure which has been rejected by the Congress as "infringing the principles of self-government and restricting their political liberty"; in other words, the Congress resents the rights of minorities being in any way regarded. It is refreshing to find Mr. Havelock Wilson, in what he termed "a little plain talk to the Congress," arguing against the course adopted by Congress on the same lines that we have often urged in these pages. He said, "They asked a man to join a trade union for trade union purposes, then after they got him into their membership they smuggled a resolution through, and said, 'We are going to charge you one shilling a year, and if you do not pay it we will prevent you from following your occupation.' That was the cause of the trouble—they were trying to compel men to pay the levy whether they liked it or not."

This exactly sums up the case, and, as Mr. Havelock Wilson observed, there is no enthusiasm over the matter. We may add our own opinion that the Bill goes a great deal too far as it is, and the unions are in danger of losing their true character of trade societies, provident societies, and Insurance Act societies, and being converted into political societies.

The attitude of the Congress towards arbitration in trade disputes is somewhat difficult to analyse. A resolution moved by Mr. Tillett that an instruction be given to the Parliamentary Committee to prepare a report and recommendation as to the basis of arbitration and conciliation was defeated by a large majority, but owing to some allusion in the first part of the resolution to compulsory arbitration the impression seems to have prevailed that the motion advocated compulsory arbitration. The vote to leave out this part of the resolution was lost, and thus the final vote seems to have been given upon the proposition of compulsory arbitration. Mr. Havelock Wilson, who has always opposed compulsory arbitration, said that since his visit to New Zealand and Australia he had changed his opinion, and was now in favour of the application of the system there in force to disputes in this country.

In the course of the debate Mr. John Ward dissociated himself from Mr. Crooks' Bill on this subject, the provisions of which we explained in the *Builder*, September 8, 1911. On the subject of the Insurance Act, the President expressed himself in favour of a universal and non-contributory scheme, but the main debate turned on the question of insurance companies becoming approved societies. The trade unions see in this a risk of their members not joining the unions as approved societies, and they accuse the employers of favouring societies other than trade unions. A motion protesting against the alleged practice was carried unanimously. It is certainly essential that good solvent societies should be open to the classes who come under the Insurance Act, and it may be a question whether the State which enforces insurance should not also control and guarantee the societies. The trade unions as provident societies have been allowed to qualify as

approved societies, but if their constitution was to be changed as the Congress have proposed should be the case, and if they became political societies, they would hardly seem suitably organised for carrying out the purely political functions imposed upon them by the Insurance Act.

A resolution relating to the position of casual labourers under the Act was carried unanimously. The resolution was to effect that exemption should be given men earning not more than 10s. a week, that yet they should be entitled to the benefit. We express no opinion upon the remedy, we do believe that the Act is bearing heavily on those casually employed, and that to oblige employers they are often compelled to produce cards stamped by themselves.

The above observations on the proposed do not purport to afford a chronicle of whole proceedings, and, whatever criticism may be passed upon certain utterances of some of the speakers, we think it must be conceded that this Congress was marked by a more practical tone and marked a higher level of debate than many of its predecessors.

In these times of industrial unrest Congress, however, had a great opportunity for putting forward practical suggestions for securing better relations between labour and capital, and it cannot be said that the Congress was by any means made of this opportunity, but the multitude of questions put forward at this annual meeting does not permit of a concentrated debate on any particular subject.

INTERCEPTING TRAPS.

THE Departmental Committee on Intercepting Traps in House Drains, into which was converted the Committee of General Inquiry originally appointed by the President of the Local Government Board in October, 1908, issued its Report.

The document is one that contains a great deal of interest for sanitarians, and may result in some modification of the practice which has been followed by the Local Government Board for more than thirty years in dealing with intercepting traps in dealing with house drains.

The Committee's investigation nominally originated in a proposal by the Willesden Urban District Council to adopt a series of by-laws in which the requirement as to provision of an intercepting trap was to be omitted. The district referred to is one that includes areas in which the ventilation of sewers is a matter of difficulty, and the cheapness of the local authority would, of course, be to utilise the private drains and ventilating pipes of the houses. The Local Government Board refused to assent to the proposal of the Willesden Council, but at the same time promised a general inquiry into the question raised.

The result of this inquiry, in the course of which fifty-two witnesses were examined and experiments were made and observations taken in Bristol as well as in some two suburban districts, is now before us.

The disadvantages alleged by the opponents of the trap are—

1. That it checks the passage of air from the sewer through the house drains, and the ventilating shafts attached thereto.

2. That it involves separate ventilation of the house drains, which, in turn, necessitates the provision of a fresh-air inlet, which of acts as an outlet for foul air and so becomes a nuisance.

3. That it complicates the construction of house drains, and enhances the cost of house drains.

4. That it is an impediment to the passage of sewage and often causes the blockage of the drain.

The advantages claimed by its advocates are—

1. That it prevents the passage of air from the sewer into the house drain, and thus prevents the entry of sewer air into the dwelling.

2. That it acts as a barrier to rats.

The Committee's investigations were directed first to the determination of the actual physical facts connected with the use of the trap as then in vogue, and the consideration of the chemical, bacteriological, and other conditions involved.

the physical results may be briefly stated as follows:—In the first place "it seems to be established (says the Report) that the trap does serve as an effectual barrier to the entry of sewer air into the house drain, which is the fundamental advantage claimed for it." Secondly, it does prevent the passage of rats. Thirdly, it does not involve "ventilation" in the sense of a current of air through the pipes, but only assists, apart from anti-siphonage pipes, operating at the top of each soil pipe. That to say the objectionable "fresh-air inlet" is omitted altogether. Fourthly, it is true that the trap is liable to "retain a considerable portion . . . of the solid matters of the sewage passing through it . . . and is to favour blocking of the trap as well as putrefaction of the sewage before it reaches the sewer." In this last fact the Committee appear to detect the chief objection to the trap. They state that "micro-organisms of sewage origin are very rarely present in sewer air." On the other hand, they may be present in drain air in large numbers. This difference is the result of the splashing of sewage which occurs in drains, and which does not usually occur in sewers." It is, therefore, inferred that "the entry of sewer air into a house is of correspondingly smaller importance, *bacterially*, than the entry of drain air." (The italics are ours.) There are, of course, other considerations on those based upon bacteriological or epidemiological grounds, as the Committee point out, and the question of the harmfulness otherwise of sewer air, especially in dwellings, is one upon which the evidence before the Committee appears to have been quite conclusive. A medical witness was "very opinionative of the theory" that sewer air, *apart from its smell*, can be a predisposing cause of disease, and the generally good health of sewer-men is pointed to as proof of its harmlessness.

The chemical evidence shows that the most frequent characteristic of sewer air is the presence of "smell." This smell is due to the presence of certain volatile substances, given off from sewage, in such minute quantities as to be harmless in themselves, apart from smell, or possibly to effluvia from moulds which may be attached to the walls of sewers. "It must now be felt that this statement is neither so lucid as the rest of the Report nor so convincing as to form a satisfactory basis for any relaxation of efforts to exclude sewer air from our homes. And the Committee quite agree that even "smell" cannot be wisely ignored, for they remind us, with a touch of humour, "that it is possible, through the sense of smell, to induce distinct modifications in physiological processes."

A further note of caution is also sounded in the statement that "there is no doubt a considerable body of medical opinion which maintains the view that certain diseases, notably phoid fever, diphtheria, quinsy and sore throat, and certain 'septic' diseases are fostered or are even actually produced by contact with sewer air or drain air."

To return to the question which was the immediate cause of the Committee's existence—the desirability or otherwise of the ventilation of sewers through house drains—two outstanding conclusions are arrived at, one being that the importance of the effect which the presence of an intercepting trap has on the ventilation of sewers, on which much stress has been laid, is probably been exaggerated, and the other that "too much importance has been attached to the question of sewer ventilation," there being "a considerable amount of evidence which indicates that the necessity for ventilation of sewers has been exaggerated." "If," say the Committee, "the objection to the intercepting trap rested solely or mainly on its interference with sewer ventilation, we should be inclined to question the importance of such an objection."

In Leeds, in East Grinstead, and in many German towns no intercepting traps are used, and in Bristol many houses have no traps, and there is an entire absence of designed sewer ventilation. No exceptional mortality appears to result. There are, however, exceptional cases in which "the ventilating shafts of house drains directly connected with the sewer have proved a nuisance, to abate which it has been necessary to insert intercepting traps."

It would appear that still further investigations are desirable, and that in the meantime will be consonant with the dictates of caution close to the "fresh-air inlets" on our house drains and to retain the disconnecting trap.

L.C.C. SCHOOL OF BUILDING.

THE Evening School of Building, Ferndale-road, Brixton, organised by the London County Council, will open for the tenth session on the 23rd inst. Mr. H. W. Richards is the Principal, and his assistant is Mr. Arthur R. Sage. Professor Beresford Pite, F.R.I.B.A., is the Director of Architecture.

The Evening School has been established to enable artisans and others engaged in the building trades and allied professions to acquire an intimate knowledge of the principles that underlie the processes which they have to carry out in their daily work. Workshops have been provided and equipped for the practical teaching of the several building trades under conditions similar to those met with on buildings and in builders' shops.

The prospectus divides the work of the School into five parts, viz. Section 1—Trade Subjects (Workshop Practice and Theory); Section 2—Lectures and Classes in Building Construction and Allied Subjects; Section 3—Surveying; Section 4—Structural Engineering; Section 5—Architecture and Drawing.

In the practical trade classes admission will be given to those engaged in the trade only. These classes are intended to supplement workshop practice and not to teach trades. Students in these classes are expected to attend the lectures and drawing office work in connexion therewith, and those who fail to do so will not be allowed to continue the workshop practice.

The Advisory Sub-Committee consists of Mr. J. S. Holliday (Chairman), Messrs. W. J. Carpenter, W. Davis, W. Elliott, R. F. Gilling, T. A. Hards, F. Higgs, G. H. Manser, H. D. Seales-Wood, F.R.I.B.A., and G. Stagg.

In the various classes the Principal is supported by a numerous and efficient staff.

A School of Architecture, with courses of instruction in the history of buildings and for the study of architectural design and planning, together with the preparation of architectural drawings, has been added as part of the complete scheme of the work of the School. The work of several classes will be under the general superintendence of Mr. J. B. Fulton, A.R.I.B.A., assisted by Mr. H. F. Murrell, A.R.I.B.A. Mr. G. Dennis, A.R.C.A., will give instruction on architectural perspective and lettering. Lectures upon examples and criticisms of the students' work will be given during the session by Professor Beresford Pite, F.R.I.B.A.

Day Technical Schools for Boys, Junior and Senior, will be open on five days in the week to provide a sound scientific and technical training for those preparing to enter the building trades and allied vocations.

Full particulars of all classes will be sent on application to the Principal, the School of Building, Ferndale-road, Brixton, S.W.

HARDWARE EXHIBITION, OLYMPIA.

THE Hardware, Ironmongery, and Domestic Appliances Exhibition, with which is allied an Exhibition of Oil Engineering, is open at Olympia until the 17th inst., and many interesting features are on view. Among heating appliances may be seen anthracite kitcheners and stoves by the London Warming and Ventilating Company, Ltd., who give cooking demonstrations daily (Stands 180 and 194), and the various productions of the Intervest Stove Company, Ltd. (Stand 196). Messrs. C. A. Peters, Ltd. (Stands 135 and 150) show the Carbotron portable stoves for heating motor-houses and various household specialities: Messrs. Helliwell, Ltd. (Stand 182), exhibit fregrates and mantelpieces; and The Petroleum Solid Fuel (Parent) Company, Ltd. (Stands 15 and 26), show the various "Petrol" briquettes, firelighters, and other novelties.

The British Vacuum Cleaner Company, Ltd. (Stands 93 and 108), have in operation a full range of hand and power vacuum cleaners, and The Electric Appliances Company, Ltd., with their portable vacuum cleaner, are at Stands 114 and 127.

The possibilities of lighting by acetylene gas are brought forward by the Thorn & Hodde Acetylene Company, Ltd. (Stand 208); the Acetylene Corporation, Ltd. (Stand 205); the Leading Light Syndicate, Ltd. (Stand 7); the Dennis Acetylene Illuminating Company (Stand 8); and by the Acetylene Publicity, Ltd. (Stand 8A).

Oil engines and similar appliances are shown by the Westinghouse Brake Company, Ltd.

(Stand 4), by the India Rubber, Gutta Percha, and Telegraph Works Company, Ltd., and by the Crossley Gas Engine Company (Stands 60 and 61). Messrs. Tangyes, Ltd. (Stands 95 and 106), are represented by various well-known engineering inventions.

Among other exhibits to be mentioned are the models of a pump rig, derrick, and engine-house, with plans, and other features, shown by Mr. George W. Mancell (Stands 55 and 68); the chemical fire extinguishers and other fire appliances of the Harden Star-Lewis and Sinclair Company (Stands 17 and 24); the sash-lines, blind and other cords of Messrs. J. Austin & Sons, Ltd. (Stands 13 and 28); the "Kaye" oil cans, fillers, oil pumps and lamps made by Messrs. Joseph Kaye & Sons, Ltd. (Stands 39 and 42); the "Climax" carpenter's cramps of Messrs. Crampton Brothers; the brass and iron fire guards and other work devices of the Holborn Wire and Cage Works (Stands 92 and 109); and the enamelled ware of Messrs. Oscar Molnich & Co., Ltd. (Stands 139 and 149).

GENERAL BUILDING NEWS.

CHURCH EXTENSION, BIRKENHEAD.

The foundation-stone was laid last week of the Lady Chapel of St. Matthew's Church by the Mayor of Birkenhead. The scheme comprises clergy and choir vestries, lady chapel, south aisle, and ambulatory, and when completed the seating accommodation of the building will be for 514 people. The architects are Messrs. Nagington & Shennan, of London and Liverpool.

SCHOOL, KILBIRNIE.

A new school is to be built between Kilbirnie and Glegarnock from the plans of Messrs. H. & D. Barclay, architects, Glasgow, to accommodate 400 children.

PUBLIC SCHOOL, GLASGOW.

A new public school has been erected in Carmichael-place, Langside, at a cost of about 17,000. The building is two stories high and has a frontage of about 170 ft. and a depth at the wings of 120 ft. The architect for the work was Mr. Ninian Macwhannell.

INFANTS' SCHOOL, MERTHYR.

This new school has been erected at a cost of about 4,615*l.* from the designs of Mr. F. Thackeray, the Borough Architect, and the building will provide accommodation for 250 children. The contractors were Messrs. Enoch Williams & Sons, of Dowlais.

SECONDARY SCHOOL, GIRVAN.

The new secondary school for Girvan and district, erected by the Girvan School Board at a cost of 7,000*l.*, according to competitive plans by Mr. Wm. Cowie, architect, Ayr, was opened on the 2nd inst. The building is planned with a central hall on each floor, giving direct access to the classrooms, the upper hall leaving an open gallery on one side, with high mullioned windows connecting the two stories. There are separate entrances for boys and girls, and separate entrances at each end of the hall, with cloakrooms, etc. There are nine ordinary classrooms for thirty pupils each. On the upper floor there are a science-room, art-room, cookery and laundry room, and gymnasium, while a portion of the old school has been converted into a work-room for twenty boys. The principal facade is in a free treatment of Renaissance in red sandstone, while the elevations are of brick and rough-cast, with stone dressings.

KIRKCONNEL NEW SCHOOL.

At a meeting of Kirkconnel School Board it was agreed to accept the plan by Mr. Crombie, architect, Dumfries, for the erection of a new school at an estimated cost of 3,100*l.* The school will consist of four rooms and a corridor, with the customary outside offices.

NEW SCHOOL AT LIANGAN.

New Liangan Schools have just been opened. Accommodation is provided for 122 children. The school is built of local stone, and the exterior is part rough-cast, together with the Welsh slates. The building was designed by Mr. D. Pugh Jones and built by Messrs. Vickery Bros., Barry Dock.

COUNCIL SCHOOL, STRATFORD.

The Senior Department of the London-road Council School has been erected from the designs of Mr. A. S. R. Ley, Lic.R.I.B.A., at a cost of about 4,915*l.*, and the building provides accommodation for 376 children in eight classrooms. The building has been planned in order to allow of future additions, when it is expected to increase the accommodation to 636 children. The builder was Mr. George Brown, of Grays, and the clerk of works was Mr. T. J. Day.

SCHOOLS, HARGROATE.

The new schools for girls, Queen Ethelburga's School, at Killinghall Moor, Hargroate, are, says the *Yorkshire Herald*, the result of a limited competition, in which six architects were invited to submit designs, and that of Mr. W. Gribbee Scott, F.R.I.B.A., was selected. He is the architect of the whole of the buildings, with the exception of the chapel, which was erected from the designs of the late Mr. C. Hodgson-Fowler, F.R.I.B.A., of Durham. The scheme comprises the school block, head mistress's house, four large boarding-houses, a sanatorium, lodge, and chapel. Of these, the whole have been erected with the exception of two of the boarding-houses and the sanatorium, which will be added as soon as the school fills up. The school block provides accommodation for 150 girls. The floors and staircases are of fireproof construction. The classrooms are grouped together for the lower, middle, and upper schools. The floors are of pitch-pine blocks, and the walls have panelled dadoes. The large science-rooms are provided with preparation, balance, and store rooms adjoining. There are also two fine rooms for the teaching of elementary and advanced art, each having large north windows. The assembly hall is in the centre of the building, opposite to the principal entrance. It is 60 ft. by 34 ft., and is provided with a gallery at one end. The vaulted entrance hall with its recessed alcoves forms an interesting feature between the front vestibule and the assembly hall, and provides crush-room space just where it is required. The gymnasium is on the lower ground floor, and is 55 ft. by 25 ft., and 20 ft. high. It has a gallery for spectators at one end. A large number of rooms for the teaching and practice of music are provided. These are placed in a separate building, which is connected with the main block by a corridor. The partitions and ceilings of all rooms are formed of a combination of plaster and slag wool, with hollow spaces between, and all the doors are double. Private rooms for the headmistress and assistant mistresses are provided, and also other rooms for various purposes. Rooms for the teaching and practice of domestic economy are also provided. A covered playground is provided immediately adjoining the school block, and also stores for games, bicycles, etc. The house for the headmistress forms a wing to the school block, and contains accommodation for some of the assistant mistresses in addition. An open covered corridor, 10 ft. wide, connects the school block with the chapel and with each boarding-house. Each boarding-house is an entirely detached building, forming a complete home in itself, and contains accommodation for thirty-eight girls and for five assistant mistresses. Each girl has a separate cubicle, except that, in a few instances, rooms are arranged for sisters. There is a lounge hall for common use, and a play-room and a preparation-room. Six small studies are provided for the elder girls. There are twelve bathrooms in each house, the walls of which are tiled. The floors are of fireproof construction, and ample means of escape in case of fire are provided. There are three staircases in each boarding-house, two of them being fireproof. All the doors are made with pitch pine blocks. The houses and the school block are heated throughout with hot-water pipes and radiators, but all sitting-rooms and the lounge hall have fireplaces as well. The buildings are faced with red brick, and the ornamental portions are of Pateley Bridge stone. The roofs are covered with green Westmorland slates. The style is Georgian, quietly treated. The contractors for the whole of the works, excepting the chapel, are Messrs. Harold Arnold & Son, of Rugby, and the clerk of works is Mr. E. Bilby. The cost of the complete scheme is estimated at about £5,000.

TRADE NEWS.

Lee's "All Time" sheet-lead and asphalt damp course has been specified and extensively used on the new Southmead Infirmary near Bristol.

Messrs. Spalding & Myers, of 36-37, King-street, E.C., are the architects for new printing works now being erected in Emerald-street, Theobald's-road, by Messrs. E. A. Roome & Co., 36, Basinghall-street, E.C.

Under the direction of Mr. R. T. Longden, Lic.R.I.A.B., Stoke-on-Trent, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "Air Pump" Ventilators and Air Inlets, has been applied to Rudyard Chapel, Rudyard, Staffs.

Messrs. Patman & Fotheringham, Ltd., 100 and 102, Theobald's-road, London, W.C., also of Park-street, Islington, N., have secured the following contracts:—Extension to Mayfair works, Miles-street, South Lambeth-road, for Messrs. Brand & Sons; taking down and rebuilding front and other alterations at No. 70, Fleet-street, E.C., for Messrs. Sweetings, Ltd.;

new works and garage, etc., for the National Steam Car Company, Nunhead-lane, Peckham, S.E.

The Church National Schools, Beccles, are being supplied with Shorland's Warm-Air Ventilating Patent Manchester Grates by Messrs. E. H. Shorland & Brother, Ltd., of Failsforth, Manchester.

PIECE AND TIMEWORKERS' HEALTH INSURANCE CALCULATOR.

A USEFUL calculator, the first of a new series being brought out by Messrs. Gall & Inglis under the title of the "Flash" Reckoners, is a "Health Insurance Calculator." The necessity for such a calculator has no doubt been felt already, for while in many cases the ascertaining of the rate of remuneration for the purposes of the Insurance Act is fairly simple, when through short time or a broken week's work employees' earnings verge upon the differential rates of insurance, it is not always easy to find out quickly the exact amount allowed by the Act. The Health Insurance Calculator has therefore been devised so that by the movement of the finger the exact amount of insurance is quickly ascertained. The working of the calculator is very simple, for by the movement of two slides the separate calculations involved are brought together, and a finger points to the workers' and employers' rate of contribution. The calculator can be obtained at No. 31, Henrietta-street, Strand, W.C., price 2s. net.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Extensions to factory of Messrs. John Mallis & Son, (2,500); Mr. G. Bennett Mitchell, architect, 148, Union-street, Aberdeen.

Arbroath.—Extensions to factory (4,500) for Messrs. F. Webster & Sons, sailcloth manufacturers.

Askearn.—Cinematograph theatre, Moss-road, for the Yorkshire Picture-drome Company; Messrs. B. D. Fairbank & Son, architects, Craven. Bank chambers, 1, Bank-street, Bradford; Mr. W. Waterton, architect, Askearn.

Baschurch.—Bacon factory; Mr. G. Griffiths, Baschurch.

Blackwood.—Electric theatre and twelve houses, Montehave-avenue, for the Montehave Building Syndicate, No. 1.

Bromham.—Twenty-four flats, Garden Suburb Estates, for the Kaling Co-partnership Tenants Association, Ltd.

Bristol.—Factory; Mr. W. F. Bird, architect, The Island, Midsummer Norton.

Buckfastleigh.—Proposed workmen's dwellings; Mr. Andrew Warring, Surveyor, U.D.C. Offices, Buckfastleigh.

Casthill.—Schools; Mr. A. Vernon Rowe, architect, 30, Foregate-street, Worcester.

Cawood (near Selby).—Reconstruction of old Wesleyan Methodist Chapel (1,000) for the Trustees.

Doncaster.—Premises, Bally-road, for Messrs W. Firth, Ltd., iron and steel merchants, Leeds; Mr. T. H. Johnson, architect, 6, Priory-place, Doncaster.

Dublin.—Proposed housing scheme (11,464). Mr. C. J. McCarthy, Architect, Town Hall, Dublin.

Dudley.—Public convenience, The Square, Holly Hall; Mr. J. Gammage, Surveyor, Town Hall, Dudley. The following plans have been passed:—Additions to church, Church-road, Netherton, and extensions Sunday school, Tinchbourne-street, for the Trustees of the Wesleyan Church; additions to Holloway-chambers, Priory-street, for the Midland Counties Mutual Benefit Society; picture hall, Cinder Bank, Netherton, for Mr. W. Williams.

Exeter.—Children's home (5,000); Mr. R. M. Challice, architect, Bedford-road, Exeter.

Fowey.—Hospital (2,000); Mr. Parkes Lees, Llanteglos-by-Powey.

Glasgow.—Alterations to buildings, Buchanan-street, Royal Bank-place, Royal Exchange-square, and South Exchange-place, for the Royal Bank of Scotland.

Heywood.—Offices at Hooley Bridge Mills; Messrs. Lowther & Bigby, 22, Market-street, Manchester.

High Wycombe.—School; Mr. T. Thurlow, architect, 25, High-street, High Wycombe.

Horncombe Chudleigh (Devon).—Residence, etc.; Mr. J. A. Lucas, architect, Guildhall-chambers, High-street, Exeter. Messrs. Woodman & Son, builders, Bartholomew-street East, Exeter.

Hove.—A plan has been lodged for a proposed church in Parkland-road by Mr. B. H. Dixon, also for alterations to Nos. 92-102, Montgomery-street, for Mr. J. W. Hayler.

Kilbirnie (Glasgow).—School (4,500). Messrs. H. & D. Barclay, architects, 245, W. Vincent-street, Glasgow.

Kilmarnock.—Warehouses, Strand and Cross streets (5,000), for Messrs. John Walker, Sons, Ltd., distillers. Alterations to building, Bonnyton-road (750), for the Ayrshire Owners' Association. Wool store, Laws street (650), for Messrs. Douglas, Reyburn, Co., spinners.

Masham (Yorks).—Town and assembly hall (5,000); Mr. J. Houfo, architect, Albion-chambers, Hargroate.

Moira.—Mission church; Messrs. Orton Sons, builders, Kilwardby-street, Ashby-de-Zouche.

Motherwell.—Presbyterian church (5,000), site of present building for the Trustees.

Nelson.—Proposed housing scheme; Mr. Ball, Surveyor, Town Hall, Nelson.

Newcastle-on-Tyne.—School, St. George's road (1,000 places); Mr. A. C. Coffin, Town Hall, Newcastle.

Oakenshaw.—Additions to Oak Mills; Messrs. E. W. Lister & Co., yarn spinners.

Portsmouth.—Shops, Magdalen-street; Mr. J. Blatherwick, architect, City-chambers, Southampton, Nottingham.

Penzance.—School; Mr. T. H. Cornish, Town Hall, Penzance.

Portree.—School; Mr. R. J. McBeth, architect, 33, Academy-street, Inverness.

Redhill.—Residence; Mr. J. A. South, architect, 52, Bishopsgate, E.C.

Rochdale.—School, King's-road, Lowerplan; Mr. E. J. Holden, Town Hall, Rochdale.

Rochester.—Additions to King's School; Mr. E. Farley Colton, architect, 43, High-street, Rochester; Messrs. West Bros., builders, High-street, Rochester.

Spalding.—Drill hall; Messrs. Scorer Gamble, architects, Bank-street-chambers, Lincoln.

Stapington (Guildford).—Alterations to Royal Hotel for the Farnham United Breweries, Ltd., West-street, Farnham.

Stretford.—Plans have been passed as follows:—Addition to works, Trafford Park, the Rubber Regenerating Company, Ltd., vicarage, Northumberland-road, for the Trustees of St. Hilda's Church; bakehouse, Empire-street, for Mr. Jas. Fryer; extensions to works for Messrs. Brett, Hamilton, & Tarbolton picture hall, Malvern-street, for Messrs. New & Gibbons; three shops, Chester-road, for Mr. J. L. Duniger; bakehouse, Moss-road, for Mr. Joseph McFetrick. A plan has been lodged for alterations to King's Hall by Mr. W. J. Cadman.

Throston.—School; Mr. H. C. Crummas, Surveyor, Town Hall, Hartlepool.

Tonbridge.—School; Mr. B. C. Andrews, architect, Biddicks-court, St. Austell.

Todmorden.—Conversion of Fielden House into club (1,000); Secretary, Conservators Club, Todmorden.

Underhill.—School; Architect, County Hall, Dorchester.

Yorks (W.R.).—Schools, Horsforth & Brierley; Mr. J. Stewart, Architect, Sh. Hall, Wakefield.

BUILDING TRADE WORKERS.

A meeting was held on the 8th inst. building trade workers at the Kingsley Hotel, Bristol, when addresses were given on "Our Union for Building Trade Workers," the Chairman being Mr. T. C. Lewis, Secretary of the Trades Council. A resolution was moved endorsing the principle of consolidation of existing organisations, recognising the good work done by sectional unions, and expressing the opinion that the workers must organise on the basis of industry. The resolution, after being seconded, was put to the meeting and carried.

A NEW SHOWROOM FOR HEATING APPARATUS.

Messrs. Hartley & Sugden, Ltd., of Halifax have opened showrooms and offices at 61, Gr. Portland-street, W., and will be glad to meet at that address all those who are interested in the problems of heating. The firm propose to supply for heating hospitals and other institutions, churches, business premises, hotels and houses of all sizes, with the various accessories to the plant. They are prepared to demonstrate the advantages of independent boilers for supplying hot water in every sort of building, even where the heating requirements are not large. It is contended that the range boiler is not the most economical means of heating water for bath and other purposes, the supposed "water heater" from the fire being in reality an expensive product. The range boiler is heated by coal, while the independent boiler is heated by coke, cinders, and any combustible household refuse. The kitchen fire can be reserved therefore, for its legitimate purpose of cooking, without the necessity of diverting the heat from the ovens sometimes when it is least convenient.

Design for Stencil Frieze. By Mr. T. A. Godfrey.

DESIGN FOR STENCIL FRIEZE.

Characters from Shakespeare's "As You Like It." This design for a stencil frieze is to be placed in the hall of the London County Council's special school situated in the Old Kent-road. The subject has been selected that would be most likely to appeal to children and at the same time one that would be of some educational value. Three colours are to be used in the modelling, and the room is being painted to harmonise with and help the colours selected for the frieze. It was first thought to make the design a repeat, but on further consideration it was concluded that it would not be the good taste to have a repeat of definite characters and those characters engaged in definite action. The result is the scheme is to be enlarged, and designs are being made taking other comedies of Shakespeare's for models. A large proportion of the space will be given to "Midsummer Night's Dream," the number of stencils will thus be in hand that can be placed upon other walls in other schools. Under each character will be stencilled the name.

NEW TOWER, ST. VINCENT'S CHURCH, SHEFFIELD.

The tower of this church, shown in our illustration (p. 314), has been completed at the cost of £1,000 by the benefactor of the parish, the opening ceremony being performed on October 29 last, in the presence of his Eminence Cardinal Logue. The church, which is situated in the slum quarter of Sheffield, stands on the summit of rising ground, and the position of the tower, seen from distant parts of the city, is a very commanding one. It was originally opened in 1856, and the north aisle was added in 1898. The lower part of the tower was built in 1870. Its dimensions are 22 ft. square at bellry level, and 33 ft. high from ground to top of parapet 93 ft. The architects of the whole of the works described have been the late Mr. M. E. Hadfield and Messrs. C. & C. M. Hadfield. The contractors for the recently-finished tower were Messrs. D. O'Neill & Sons.

INFLUENCE AND ETHICS OF COMPETITIONS.

The following is taken from a paper, prepared by Mr. Donn Barber, and printed in the proceedings of the forty-fifth annual convention of the American Institute of Architects.* The paper, of course, deals with a competition system in the States, but the views of the author will be of interest here:— "It must be admitted that the subject of competitions considered in any of its aspects is a most vexatious problem, and one which, in all probability, will never be solved to the complete satisfaction of the building public or the practising architect. Competitions in one form or other are as old as the art of architecture itself, and history teaches us that the resulting heartburning and disappointments, the strife and argument, the petty jealousies, the every important doubt to whether, after all, the best man and the best work have really won, obtained just as much in a competition for St. Peter's at Rome as

it has perhaps in our lesser competitions for a post office of negligible importance.

It would be improper and unfair, indeed, to condemn competitions as a whole and indiscriminately, for from some points of view they seem to be a necessary evil. We can, I think, admit that competitions in themselves are not necessarily evil. It is the continual abuse and mismanagement of competitions, the unbusinesslike, undignified, inadvised desperate sort of struggles that ever carries in their train disappointment, prejudice, criticism, and hard feelings of many and varied kinds, that is responsible for a condition that has become a most serious consideration in contemplation of the interrelation of architects and bearing upon the actual work that we as a profession are doing and standing for. The architectural profession has for years been kept in a state of commotion and hot water while the real solution of the difficulty seems as yet unobtainable.

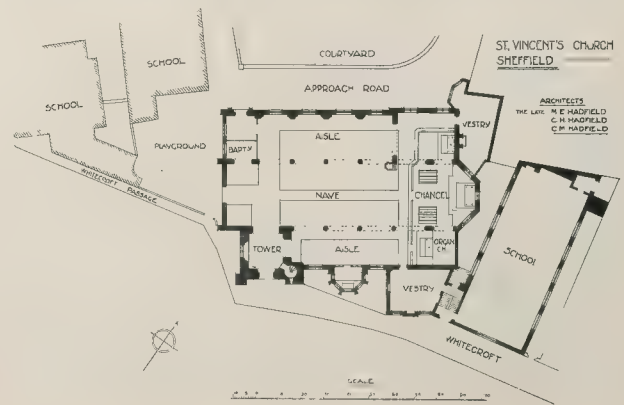

It seems to have become a very generally accepted and recognised tradition in certain cases, notably where proposed structures of a public or semi-public nature are involved, that architectural competitions still prove to be desirable or necessary as furnishing perhaps the best available means for selecting an architect.

Just at the present time in this country, however, architectural competitions seem to be declining somewhat in popularity. Where only a comparatively few years ago competitions were sufficiently numerous to provide almost continuous employment for some firms who were fortunate enough to acquire the major part of their work in that manner, to-day we find an immense quantity of important work being given out by direct selection and appointment to architects, and competitions comparatively infrequent. It would be difficult to assign any real reason for the change which seems just now to be taking place. Can it be that the owner is gradually coming to see that competitions are at best very slow, and if properly conducted a most expensive method of choosing an architect; is it possible that the owner realises that an occasional good preliminary scheme is, after all, the real limit

of the competition method, and, that being the case, competitions are in the main of no advantage to him? Does the owner begin to appreciate the extreme difficulty of devising a scheme of competition that will afford him conclusive assurance and evidence of the winner's ability to secure for him the final and practical execution of the design selected, without committing him to unnecessary if not inordinate expense.

Notable instances exist where architects who have proven adepts in the preparation of competitive designs, men of extraordinarily developed imagination and possessing marvellous dexterity in draughtsmanship, have been awarded the prize and later the work, as a result of competition, and have during the prosecution of the work shown themselves to be devoid of practical experience, and even lacking in the ability to discriminate in the selection of competent assistants or superintendents. The ultimate results in such cases have very probably had the very natural effect of somewhat impairing confidence in the competition method of selecting an architect. It is only fair to say, on the other hand, that there also exist many instances where notably satisfactory results have been obtained through the method of competition; but have these not ordinarily followed as a result of choosing the competitors from the ranks of competent and thoroughly experienced practitioners, and paying the competitors so selected an adequate or reasonable sum for their sketches? Exceptions to this latter rule might be noted in the cases of Government or municipal work, and perhaps possibly in some private work of sufficient size and importance to induce the experienced architect to enter an unpaid contest; but even in such circumstances the competitors have usually been limited in number and carefully selected.

It must of necessity be prejudicial to the interests of the owner that any architect should be allowed to enter a competition who cannot in advance establish his ability and competence to properly design and satisfactorily execute the work involved if entrusted to him. It is sometimes urged that to open an unlimited competition may disclose some unknown

*Published by the Board of Directors of the American Institute of Architects, Mr. Glenn Brown, Editor.

St. Vincent's Church, Sheffield.

Messrs. C. & C. M. Hadfield, Architects.

but brilliant designer. This reasoning might be valid if the sole object of a competition were to secure a brilliant set of sketches. But unfortunately sketches in themselves give no real evidence that their author has the technical knowledge or matured ability to fulfil the promise of his sketches through proper and adequate control of the work itself in execution.

The general influence of competitions can for present purposes be broadly divided as regards the influence on the architect. Theory presupposes competitions to be instituted with the sole purpose of advancing the interest of the owner, and practice proves that these interests are best served where a fair, clean-out and equitable agreement has been entered into between the owner and the architect before the competition takes place.

The American Institute of Architects, after years of untiring study and labour, has finally issued a circular of advice relative to the conduct of architectural competitions as a statement of the principles which it believes should underlie such agreements. Serious

difficulty with the system prescribed, however, has been found in some cases where it has proven inexpedient, not to say impossible, to carry on important competitions along the lines of what is conceded and believed to be the best practice, owing to the general and natural desire on the part of the owner to get free advice in the form of the greatest possible number of competition sketches, and also on account of the surprising willingness on the part of the architect to rush into competitions where no prearranged agreement or understanding exists with the owner. The owner often regards what he believes to be the information contained and given in his particular competition in the light of a consensus of expert opinion on the subject of the problem before him, and therefore is pleased or disappointed, as the case may be, with what he regards to be the possibilities of his project. On account of the quality and character of the information so given, however, the real satisfactory solution of the problem is often complicated, and confusion rather than lucidity results. We have all seen the results of what

have been termed "unregulated scrambling" and how many times this inconsistent, businesslike, undignified, and certainly inart mode of procedure has carried with it its disappointments, prejudices, and sins.

Why an owner, even when he has taste, judgment, and is, besides, a good business man, possessing an ordinarily sound common sense, continues to persist in this method of obtaining a design for a building is a question which we architects must answer. It is certainly a most discouraging situation, looking at it entirely unselfishly and from a directly professional standpoint.

The shortsighted, unbusinesslike practice of the seeking out of a client and the offering to him of preliminary services on approval, gratuitously, whether in competition or in hope of finally being awarded the work, to a great degree in the past lowered the dignity of the profession as a whole and resulted in cheapening of the architect's services in the mind of the building public. The average owner seems to attach no particular value to architects' sketches either as meaning standing for more than he himself can see them, or as representing anything like cost and labour involved in their production.

Architects are not paid enough for the work they actually do to be able to afford to live on their earnings on the whims and fancies of an owner who is willing to take, without compensation from them in any form or amount, professional advice which may be the result of years of technical preparation and experience. The public should be made to feel that the architect who bears the title of architect has the knowledge and ability needed for the proper invention, illustration, and supervision of all building operations which may be entrusted to him, and that his services when desired or sought are entitled to commensurate remuneration. An architect should have a better standing in the community: he should be more prominent before the public and its public enterprises in the courts, and in all matters of good and helpful citizenship. To just how much of a lack of all this can we trace the influence of the practice of unlimited and irregular competition obtaining throughout the past is a question well worth considering.

The influence of competitions on the architect, aside from the undoubted educational advantage which they have furnished at unjustifiable and exorbitant expense to the profession, has been to create unreasonable jealousy and unprejudice, misunderstandings, disappointments, and in many cases undeserved criticism. It must be remembered in competitions that the resulting joy, if there is any, is of necessity confined to the winner, while the burden of disappointment is left to be shared by all others who have through labour and expense competed. It has been proven over and over again, as an economic argument in the case of competitions for smaller buildings, that unsuccessful competitors have often expended collectively in the cost of preparing competition designs, a sum equal to, if not exceeding, the gross fee that the successful architect has finally received for his complete services rendered in connexion with the execution of the work involved. This is, of course, a serious situation for the profession, and one which thus far has not been properly met or handled. It can be justified either as a good public policy or as a sound professional policy. The query is, How long can the profession be expected to afford to keep it up?

The ethics of competitions would seem to be inseparable from the ethics obtaining in the general practice of architecture. The writer's circular of advice relative to the principles of professional practice, the canons of ethics, and the conduct of competitions as prepared and circulated by the American Institute of Architects form a very complete and helpful basis for the avoidance of the usual pitfalls and temptations due to an over anxiety to work at any cost.

The application of decent methods in practice rests entirely with the individual practicing architect, who, armed with these traditional principles and possessing a broad and comprehensive vision, not to speak of a healthy and sincere desire to apply in addition to all the golden rule to all of his dealings, must let himself unselfishly at the part he must play as a force in the great work of his present in order that his architectural progeny may occupy the undisputed place in the affairs of the world.

(Continued on page 316.)

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xvii.; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* * It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

SEPTEMBER 14. — **Doncaster.**—SWIMMING BATH, &c. for YORKSHIRE INSTITUTION FOR THE DEAF.—Premiums, 50l. Information from Mr. B. D. rough, 6, Halketate, Doncaster.

SEPTEMBER 30. — **Dublin.**—UNIVERSITY COLLEGE: NEW BUILDINGS.—Limited to architects in Ireland. Assessor, Mr. H. T. Hare, F.R.I.B.A.

SEPTEMBER 30. — **Glendun.**—SCULPTURE.—The Llanely Education Committee invite competitive designs and estimates for school buildings and domestic subjects centre at Stobonheath-terrace. Assessor, Mr. G. E. Hildesley, F.R.I.B.A. See advertisement in issue of August 2 for further particulars.

OCTOBER 7. — **Beckenham.** PUBLIC ELEMENTARY SCHOOL.—Mr. A. W. S. Cross, F.R.I.B.A., assessor. Selected architects only.

OCTOBER 14. — **Batham.**—SWIMMING BATH.—The Wandsworth B.C. invite designs for a public Swimming Bath. See advertisement in issue of August 16 for further particulars.

OCTOBER 23. — **Glasgow.**—DESIGNS FOR EXTENSION OF MUNICIPAL BUILDINGS.—The Glasgow Corporation invite architects to submit preliminary sketch designs in competition for the extension of the Municipal buildings. Five will be selected to submit complete drawings in final competition. See advertisement in issue of July 12. Dr. Burnett, assessor. Deposit, 1l. 1s.

OCTOBER 31. — **Huddersfield.** TOWN PLANNING.—The Housing and Town Planning Committee of the Huddersfield Corporation invite designs for the laying-out of certain areas within the town of Huddersfield. Particulars in the Huddersfield News, 100s., 50s., and 25s. Deposit of 2l. 2s. See advertisement in issue of August 2 for further particulars.

OCTOBER 31. — **Llandudno.**—LANDSCAPE GARDENING.—The Llandudno U.D.C. invite designs for laying-out land adjoining the Happy Valley, about 20 acres in extent. See advertisement in issue of September 6 for further particulars.

NOVEMBER 1. — **Ottawa.**—MONUMENT TO KING EDWARD VII.—Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa. Particulars from the Public Works Department, Ottawa (see p. 174, August 9).

DECEMBER 1. — **Bulgaria.**—DESIGNS FOR A ROYAL PALACE AND LAY COVERS.—Particulars from the Commercial Intelligence Branch of the Board of Trade, Basinghall-street, E.C. (see p. 173, August 9).

DECEMBER 2. — **Carlisle.** SCHOOL BUILDINGS, &c.—Particulars from the City Surveyor, 36, Water-street, Carlisle.

NO DATE. — **Rangoon.**—MUNICIPAL BUILDINGS.—The Committee of the Municipality of Rangoon invite designs for the new Municipal Buildings. Honoraria of 300l., 200l., and 100l. respectively for first, second, and third. See advertisement in August 2 and 30 for further particulars.

NO DATE. — **Jordanhill, Glasgow.**—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in "Competition News," December 1, page 685.

NO DATE. — **Wetherwell.**—HIGH SCHOOL.—Dr. Burnett, assessor. Premiums 50l., 30l., and 20l.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

SEPTEMBER 14. — **Bishop Auckland.**—HOTEL.—For pulling down and rebuilding the Black Boy Hotel, Newgate-street, Bishop Auckland. Messrs. J. Johnson & Son, architects and surveyors, 7A, Prospect-chambers, Darlington. Deposit of 1l. 2s. for quantities.

SEPTEMBER 16. — **Broadclyst.**—COW-HOUSES.—Erection of new cow-houses at Clyston Mills, Broadclyst. Plans with Messrs. E. H. Harbottle & Son, architects, County-chambers, Exeter.

SEPTEMBER 16. — **Poole.**—COTTAGES.—For erection of eleven cottages in Skinner-street and Pounder-street, Poole, for the Poole Housing Association. Plans and specifications with Messrs. Bacon & Jurtia, 44, High-street, Poole.

SEPTEMBER 16. — **Portsmouth.**—OFFICES, &c.—For rebuilding the offices and other work at the Fratton-street Council school. Plans and specification by the Surveyor, Mr. Alfred H. Bone, Cambridge Junction, Portsmouth.

SEPTEMBER 16. — **Tredegar.**—HOUSES.—Erection of thirty-one houses for the South End Building Club, Tredegar. Plans and specification with Mr. A. F. Webb, M.S.A., architect and surveyor, Blackwood.

SEPTEMBER 16. — **Tyrene.**—CHURCH.—For building a new church at Pomeroy, Co. Tyrone. Plans and specification with Messrs. William H. Byrne & Son, architects, 20, Suffolk-street, Dublin. Quantities by Mr. A. B. Bruntz, of 5, Leinster-street, Dublin. Deposit, 10s.

SEPTEMBER 17. — **Bradford.**—COW-HOUSE.—Erection of a ten-stalled cow-house at Low Ash Farm, Thackley. Plans and specifications at the Estate Office, Hall, Thackley.

SEPTEMBER 17. — **Durham.**—SCHOOLS, &c.—For new Council school at Walbridge-lane; alterations and additions at Birtley George-street and Wingate Council schools and erection of caretakers' houses at Horden Colliery Council school. Plans, specifications, and general conditions of contract seen, and quantities at—E. Walbridge-lane, Birtley (George-street) and Horden caretakers' houses, the office of Mr. W. Rushworth, Shire Hall, Durham; for alterations at Wingate the office of Mr. N. Richley, Shire Hall, Durham.

SEPTEMBER 17. — **Halifax.**—SHELTER.—For the erection of a tramway shelter at Bradshaw. Plans and specifications seen, and forms of tender from Mr. James Lord, M.Inst.C.E., Borough Engineer, Town Hall, Halifax. Deposit of 1l.

SEPTEMBER 17. — **Maxborough.** WORKS, &c.—For new parade-room at Maxborough Police-station, and new parade-room at Moorhorpe Police-station. Plans seen, and specifications, with quantities, from Mr. J. Vickers Edwards, County Architect, County Hall, Wakefield.

SEPTEMBER 18. — **Tynant.**—HOUSES.—Erection of twenty five or more houses at Tynant, Walsort Yards, for the Tynant Property Club. Plans and specification with Messrs. Gibson, Parry Williams & Co., architects and surveyors, Portynrump.

SEPTEMBER 19. — **West Hartlepool.** STATION, &c.—For the building of a new power station and for the foundations for cooling tower ponds at the works of the Seston Carrow Iron Company, West Hartlepool. Plans, specification, and quantities, on deposit of 1l. 1s. from Mr. H. F. Friederichs, M.Inst.C.E., Borough Engineer, Corporation Electricity Works, Burn-road, West Hartlepool.

SEPTEMBER 20. — **Ardglass.**—STONE.—Erection of a drain and water store at Ardglass, Co. Down. Plan and specification with Mr. R. McCullen, C.E., Miners-town, Clough, Co. Down.

SEPTEMBER 20. — **Rhondda.**—ALTERATIONS, &c.—For extensions and alterations at the Blaenllechau infants' Council school; alterations at the boys' and girls' departments of the Cwincly-on-Clough school; repairs and laying cement concrete at the Dinas boys' school playground; repairing and asphaltizing playgrounds at the boys' and girls' departments of the Williams-town Council school. Plans and specifications seen, and quantities and tender forms from the architect, Mr. Jacob Rees, Hillside Cottage, Pentre. Deposit of 1l. 1s. for first two and 10s. 6d. for second two.

* SEPTEMBER 23. — **Winchmore Hill.**—RESIDENCE AND COTTAGES.—The Enfield and Edmonton Joint Hospital Board invite tenders for residence for Medical Superintendent and four workmen's cottages. See advertisement in this issue for further particulars.

* SEPTEMBER 24. — **Hendon, &c.**—WORKS AND REPAIRS.—The Commissioners of H.M. Works and Public Buildings invite tenders for ordinary works and repairs to buildings in the Hendon, Cricklewood, and Mill Hill districts during three years from October 1, 1912. See advertisement in this issue for further particulars.

SEPTEMBER 24. — **Spalding.**—COTTAGES.—Erection of thirty-six cottages on a site adjoining the Holbeck-road, Spalding. Plans and specifications by Mr. J. B. Corby, F.S.I., architect and surveyor, Stamford and Spalding. Quantities on deposit of 1l. 1s.

SEPTEMBER 25. — **Bristolington.**—SCHOOL.—For the erection of a new infants' Council school at Bristolington. Plans and specifications by architect, Mr. J. J. Pictor, A.R.I.B.A., Bruton.

* SEPTEMBER 30. — **Huddersfield.** POST-OFFICE.—The Commissioners of H.M. Works and Public Buildings invite tenders for erection of new post-office. See advertisement in this issue for further particulars.

* SEPTEMBER 30. — **London.**—ADDITIONAL ACCOMMODATION.—The Secretary of State for War invites tenders for additional accommodation for officers and men in existing barrack blocks, also new sanitary annexes to same, site, water, drainage water, gas mains, &c., at Wellington

Barracks. See advertisement in this issue for further particulars.

* SEPTEMBER 30. — **Plymouth.**—RECONSTRUCTION.—The Secretary of State for War invites tenders for reconstruction of chaplain's range block as twenty "A" married soldiers' quarters (in flats) at Plymouth Citadel. See advertisement in this issue for further particulars.

OCTOBER 1. — **London.**—SCHOOL, &c.—For the erection of a school and cottage and other works at East Lodge-lane, Botany Bay, Enfield. Drawings and specifications seen, quantities by Messrs. Young & Brown, of 104, High Holborn, London, and information from Mr. Richard Collins, Public Offices, Enfield. Deposit of 2l. 2s.

* OCTOBER 1. — **Tooting.**—TRAINING COLLEGE, &c.—The London C.C. invite tenders for training college and one hostel, and also adapting an existing house for a hostel on the Farnedown Estate. See advertisement in this issue for further particulars.

OCTOBER 2. — **Sedcar.** ROOM. Erection of a cookery and manual instruction room at West Dyke Council school, Redcar. Plans, specification, and forms of tender from Mr. Mennell, Cleveland District Education Office, Redcar.

* OCTOBER 2. — **Southend-on-Sea.**—PUMPING STATION, &c.—The Corporation of Southend-on-Sea invite tenders for pumping station and destructor buildings, inclined roadway, two cottages, &c., at Sewage Disposal Works, Littlewell. See advertisement in this issue for further particulars.

OCTOBER 11. — **Cold Norton.**—SCHOOL.—Erection of a new public elementary school at Cold Norton. Plans, specification, and form of contract with the County Architect, 73, Duke-street, Chelmsford. Quantities on deposit of 2l. 2s.

NO DATE. — **Barkisland.**—HOUSE.—For erection of a scullery house. Mr. Tom Hutton, Surveyor, Barkisland.

NO DATE. — **Leeds.**—ADDITIONS, &c.—For alterations and additions to the infirmary wards at the Union Infirmary, Beckett-street, Leeds. Plans and specifications and quantities from the architect, Mr. J. Mitchell Bottomley, 2, Basinghall-square, Leeds.

NO DATE. — **Merthyr.** ALTERATIONS.—For extensive alterations to the Volunteers Inn, High-street, Merthyr, for Messrs. D. Williams & Co., Taff Vale Brewery, Merthyr, specifications, &c., with Mr. C. M. Davies, M.S.A., 112, High-street, Merthyr.

NO DATE. — **Mountain Ash.**—RESIDENCES.—For erecting two detached residences at Mountain Ash. Plans and specification from Messrs. Morgan & Elford, architects, 1, Jeffrey-street, Mountain Ash.

NO DATE. — **Neath.**—REMODELING.—For the remodelling of Alderman Davies' Schools, Neath. Mr. J. Cook Rees, M.S.A., architect, Neath.

NO DATE. — **Neath.**—PREMISES.—For converting buildings at Melincrythan, Neath, into business premises for the Briton Ferry Co-operative Society. Plans and specification seen, and quantities, on deposit of 1l. 1s. from Mr. H. Alex. Clarke, architect, Briton Ferry.

NO DATE. — **West Harton.**—EXTENSIONS.—For extending the nurses' home and the infirmary kitchen, at the Workhouse, West Harton. Drawings and specification by architect, Mr. J. H. Morton, F.R.I.B.A., North-Eastern Bank-chambers, South Shields, and Newcastle-upon-Tyne. Quantities on deposit of 2l. 2s.

ENGINEERING, IRON, AND STEEL.

SEPTEMBER 16. — **Northfleet.**—HEATING.—For alterations to the heating apparatus at the police-station. Specification at the police-station, Mr. Frederick W. Buck, County Architect, 86, Week-street, Maidstone.

SEPTEMBER 17. — **Erpingham.**—BRIDGES, &c.—For the erection of bridges and culverts. Plans and specifications seen, and quantities from Messrs. A. F. Scott & Son, 24, Castle-meadow, Norwich, and 12, Holborn Hall, London, W.C.

FURNITURE, PAINTING, MATERIALS, &c.

SEPTEMBER 16. — **Chelmsford.**—PAINTING.—For exterior painting at the Admiral's Park Water Tower, Rainford-road. Forms of tender, particulars, and specification at the Borough Engineer's Office, 16, London-road.

SEPTEMBER 19. — **London.**—PAINTING.—For interior and exterior painting at offices, St. John's-road, Upper Holloway. Specification and form of tender from the architect, Mr. E. J. Harrison, 9, Gray's Inn-square, W.C. Deposit of 2l.

SEPTEMBER 19. — **London.**—PAINTING, &c.—For interior cleansing and painting at school in Hornsey-road, N. Specification and form of tender with the architect, Mr. B. J. Harrison, 9, Gray's Inn-square, W.C. Deposit of 2l.

FURNITURE, etc.—continued.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* OCTOBER 2.—**Canning Town.**—CLEARANCE OF SITE.—The Committee of the Mansfield House Women's Settlement invite tenders for clearance of site and purchase of galvanised-iron buildings. See advertisement in this issue for further particulars.

ROADS, SANITARY AND WATER WORKS.

SEPTEMBER 17.—**Bushey.**—STREET.—For the making-up of Grange-road (part 2) and Nightingale-road. Plans, specifications, etc., seen at the Council Offices on application to Mr. Ernest E. Ryder, Surveyor to the Council. Quantities and form of tender on deposit of 21. 2s.

SEPTEMBER 18.—**Reigate.**—STREET.—For private street works in Russell's-crescent, Horley. Plan and specification at the office of the Surveyor, Mr. Arthur J. Head, 48, High-street, Reigate.

SEPTEMBER 18.—**Rochdale.**—STREETS.—For sewerage, leveling, paving, metalling, flagging, channelling, and making good in New-street, Shawclough. Plans and specifications seen, and quantities and form of tender, at the Borough Surveyor's Office.

SEPTEMBER 20.—**Argoed.**—SEWAGE.—For diversion of sewer near Castle Inn, Argoed. Drawings and specification seen, and quantities and form of tender from Mr. Dan H. Price, Surveyor to the Council, Surveyor's Office, Abergarroed, Mon.

SEPTEMBER 21.—**Burnley.**—IMPROVEMENT.—For a road improvement at Higham. Particulars and form of tender from Mr. H. Pritchard, M.I.M. and C.E., Surveyor, Union Offices, Burnley.

SEPTEMBER 25.—**Belfast.**—SETTS.—The Belfast Harbour Commissioners invite tenders for supply of about 400 tons of setts. Specification of form of tender, and information from Harbour Engineer, Mr. W. Roden, Ke M.Inst.C.E.

* SEPTEMBER 25.—**Hammersmith.**—PAVING.—The Hammersmith B.C. invite tenders for paving east footpath of Wood-lane, between Shinn's street and North Pole-road. See advertisement in this issue for further particulars.

No DATE.—**Blackwell.**—SEWERS.—For the construction of 9-in. sewers in the parish of St. Norman. Particulars from Mr. H. Silcock, District Surveyor, 67, Westgate, Mansfield.

No DATE.—**Bury.**—SEWAGE.—For construction of 440 in. yds. of 12-in. diameter stone sewer. Engineer, Mr. E. T. Morland Johnson, Bank of England-chambers, Tiblane, Cr street, Manchester.

INFLUENCE AND ETHICS OF COMPETITIONS—continued from page 314.

that should rightly be given to those who (we at least believe) represent the greatest of all constructive professions.

The American architect of the future must of necessity become less of a creative artist, and more of a trained manager of building enterprise. The ever-increasing pressure for speedy and adequate execution will preclude more and more exhaustive study and tentative experimentation. It will become the duty of the architect to surround himself by specialists in design, in construction, in superintendence, in technical research and engineering; men representing every department of architectural practice, and possessing a knowledge in their individual capacity perhaps far beyond his own. The architect himself must remain, however, the master mind that organises and directs those who strive for the common cause of the work involved and for the office. He will deserve to exercise a greater moral influence in public affairs than heretofore, for the scope of his organised efforts will be nationwide, and his authority will be that of a broadly trained executive of large and varied experience which, coupled with a high sense of duty, should make him a generous and true friend of public spirit and the eternal fitness of things.

LONDON COUNCILS.

Barnet.—A plan has been passed for Mr. T. Crude for the erection of nine houses in Normandy-avenue.

Barnet (East).—Plans have been passed for Mr. H. Cufford for the erection of six houses in Leicester-road.

Battersea.—Muncaster-road and portion of Culmstock-road are to be made up, the footpaths with artificial stone and the roadways with tarred clay macadam, at estimated costs of 1,503l. and 829l. respectively.

Hackney.—The tender of the Acme Flooring and Paving Company (1904), Ltd., has been accepted by the Borough Council at 5.927l. 3s. 9d. for supplying the necessary materials and the execution of the works required for the repaving of portions of the carriageways of Stamford-hill and Kingsland-road with Acme-Sectional Jarah wood paving blocks, 5 in. deep, as has also the tender of Messrs. William Griffiths & Co., Ltd., Hamilton House, Bishopsgate, E.C., at 1,507l. 15s. 6d. for repaving the carriageway of part of Victoria Park-road with creosoted yellow deal blocks 5 in. deep. The following plans have been passed:—J. Garvy & Sons, house and shop, Lower Clapton-road; Mrs. A. Hunter, alterations and additions to Nos. 65 and 7, Tottenham-road; Mr. H. S. Goodhart-Rendel, building, Eton Mission Club premises, Rise-

holme-street; Messrs. Durbin & Katesmark, additions at German Hospital, Clifton-grove; Messrs. H. Bradford & Sons, eight houses, Wellington-road; Messrs. Moon & Ballinger, four shops, Lea Bridge-road. Mr. C. W. Hodgson, on behalf of Messrs. Brook & Son, has lodged plans with the London County Council for the erection of a factory in Chateworth-road.

Sunbury.—Plans have been passed for Messrs. Smith & Co., Walthamstow, N.E., for the erection of six houses in Orchard-road, Park-road.

FOREIGN AND COLONIAL.

Building in Egypt.

The Egyptian *Journal Officiel* of August 17 notifies that tenders are invited by the Ministry of Public Works for (1) the construction of three pavilions for the Khanka Lunatic Asylum; and (2) the sanitary equipment for these pavilions. Sealed tenders, on stamped paper (obtained from Mr. A. L. Webb, C.M.G., Queen Anne's-chambers, Broadway, Westminster, London, S.W.), will be received up to 11 a.m. on September 30, by the Chief of the Administrative Service, Public Works Ministry, Cairo, at whose office the specifications, plans, and estimates can be seen. Local representation is necessary.

OBITUARY.

Mr. J. Wolstenholme.

The death on September 6, at No. 11, Hillgrove-road, London, N.W., is announced of Mr. James Wolstenholme, in his 80th year, lately of Blackburn, architect and surveyor. Mr. Wolstenholme, in 1861, he being then the Borough Surveyor, made the plans and designs for the Blackpool Sanatorium, comprising two wards for forty patients, and four cottages, with administrative, laundry, and disinfecting blocks, stabling, etc., erected at a cost of 9,000l., and enlarged in 1905-6 by Mr. J. S. Brodie, the Borough Engineer.

The Late Mr. R. C. Jones.

Among other works of Mr. Jones (see p. 287) should be mentioned the Congregational Church at Ryde and the superintendence and measuring of the excavations at the Roman Villa at Brading, discovered at the beginning of the 'eighties.

PATENTS.

APPLICATIONS PUBLISHED.

19,755 of 1911.—Charles Henry Sparks: Gutter bracket and wedge.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

ARCHITECTURE, COMMERCIALISM, AND PUBLIC RIGHTS.

WE live in a commercial age and in one of rapid developments unlike any of which we have records. Between the date of the Conquest and the reign of Elizabeth—a period of some 500 years—the population of England doubled itself, a result which, though enormously affected by the destruction caused by the Black Death, yet indicates a state of things having no similitude with the present time, when such an increase takes place within a period of fifty years.

A slowly-growing population has no need for advertisement; a small addition to a village inn, its renewal if burnt down, met most necessities in the past; trades were largely traditional, handed down from father to son; primitive means of communication meant that each man had a good knowledge of all within a small locality and little or none of the outside world; a suit of clothes lasted for years, and was replaced by another made by those whose calling had descended from generation to generation. Neither display in a shop window nor printed advertisements would have had value under such conditions. One result of all this was that there was no factor to be

considered in design in any way analogous to modern commercialism.

Now the insistent cry of the trader is for advertisement, and this no longer confined to a mere printed notice, but an appeal which must be emphasised by the very buildings devoted to certain purposes. No longer does a man obtain his goods from those he knows personally; as often as not he will go to a fresh shop or place of business every time, convenience largely dictating his choice, and the shop-keeper has to respond by making his goods and place of business conspicuous, often in a way which is detrimental to the architectural amenities of a whole district. Nor does the evil stop short with the shop; an hotel proprietor seeks to attract new custom by giving us what is frequently but an advertisement-board in masonry; the railway companies must attract attention by carrying out the fronts of their stations in materials out of harmony and keeping with all their surroundings; the banks and insurance offices find it is necessary to advertise the flourishing state of their finances or the convenience of their position by putting up buildings in novel materials or by means of design calculated to arrest the attention of the casual passer-by.

Frequently a building pleases its promoter more completely because it is out of harmony with its surroundings than for any other reason—it creates "a shock" which may lead to custom, and so in violating every canon of architecture it serves the promoter's purpose.

Occasionally we find a business corporation, such as Lloyds Bank, inclining to the opinion that architectural excellence and quiet suitability of design may constitute an appeal to the public, but the reverse feeling is that usually obtaining.

And it would be often wrong and unfair to blame the building owner's architect. Having a clear instruction, implied or expressed, he has to satisfy a demand, which he knows to be wrong, in the best way he can, and often he does it exceedingly cleverly.

Such an instance is Messrs. Waring & Gillow's new premises in Oxford-street. We feel that the sculpture and ornament of such a block, which would be right and proper in some great domestic or public building, is unmeaning when applied to what is in reality a warehouse for the display of goods.

The great new block which Messrs. Selfridge have erected is a more logical

The Need for Control: A View from Bloomsbury-square.

rendering of the wants of such an enterprise, though here, too, we feel that an importance is perhaps given to a utilitarian building which is not wholly in keeping with the necessities of the case. And it is unfortunate when such a building entirely dwarfs and destroys the scale of its surroundings. The problem of Regent-street is still unsolved, though our recent efforts in this direction will, we hope, bear some fruit in the fulness of time.

The very finely-designed front for Messrs. Debenham & Freebody, in Wigmore-street, which we think one of the most successful of commercial designs, is not improved by a tower which is unnecessary and which is hardly in complete harmony with the remainder of the design, but which we can well imagine appeals to commercialism.

Kingsway is a modern failure because most of the buildings in it are a restless appeal to our attention, and show a supreme disregard for what should be their *métier*—harmonious parts of a fine boulevard.

Further north we have the new Sicilian-avenue, which we illustrate from the Bloomsbury-square end, cutting awkwardly both with the square and with Southampton-row. The County Council Central School of Arts and Crafts and Tollard's Hotel compose somewhat awkwardly with Mr. Keen's Baptist House in the same road, but probably in each case the designers had more or less to make their buildings appeal to the notice of the passer-by.

We also illustrate the Imperial Hotel and its extension now being erected in Russell-square. These buildings, we believe, are ably planned and well thought out as practical problems, but the assumed necessity of making a strong appeal to the passer-by has conflicted with the lines on which alone a building in such a position could harmonise with its surroundings.

These are but a few instances among thousands which might be noted in modern London which show the difficulties which the present age lays upon us, and we should consider the means, if there are any, by which the architectural amenities could be more effectually preserved than is the case at present. The remedy does not lie in socialistic legislation, which would militate against the value of property and commercial security, nor in unreasonable interference with the liberty of the individual. Were this the case the greatest happiness of the greatest number would be secured by allowing the interests of our art to be sacrificed for the public weal. Henry IV. of France, in defining the object of good government as "to make it possible to grow two fig-trees where one grew before," showed a profound political instinct wanting in those who recommend socialistic panaceas.

But much can be done without heroic remedies. To prevent a man making full use of a site by keeping down the height of his building is clearly impossible, but there is no reason why an appeal should not be made to the great ground

landlords of London, asking them to consider in granting building leases the effect of any proposed buildings on its adjoining neighbours. Often a building suitable on one site would be entirely unsuitable on another, and in many of the great London estates there would be room for such alterations of site. We must always remember that while the land abutting on a street or square may be private property, the thoroughfare which is public property is also bounded by buildings, and that the preservation of the beauty of our streets concerns the passer-by.

It would be quite feasible for the great landowners to consult with some committee or individual, nominated possibly by the Royal Institute of British Architects, as to such points, and it is more than likely, if properly approached, that great landowners would be willing to consult such committees or nominees.

With regard to advertisements of the poster type, we feel that the often suggested idea of taxing such notices, as is done everywhere on the Continent, has much to recommend it. It would not stop advertising, but it would render it more expensive. At present the firm who can spend most has the advantage, and under a system of taxation the same would hold, but a certain proportion of the money spent would go in taxation, no charge being made in the relative advantage possessed by one trader over another. Apart from relieving the public purse, the disfigurement of posters would be reduced in scale, because posters would be taxed according to their size. Such permanent advertisements as sky-signs and illuminated advertisements might well be rendered illegal. A system of taxation applied to large lettering across the front of buildings would also reduce the evils of what is one of the most effective of all means of disfiguring a building. Public bodies might well exercise some control over the sanction to be given for the erection of buildings whose materials offer a violent and unpleasant contrast to their immediate neighbours. It will be remembered in this context that many years ago the City of Edinburgh rightly took action to oppose the erection of an insurance office faced with terra-cotta and out of harmony with the neighbouring stone buildings, and such action has reason to recommend it. Such control is of another character to the fixing of minute and arbitrary rules, such as those often insisted on by the County Council and other public bodies, in connexion with the prevention of fire, housing schemes, ingress and egress to public halls, and similar points. It is well known that in the case of certain insurance and other private offices the authorities have insisted on special bolts and fittings for fire-prevention purposes, which bolts and fittings have been replaced when the buildings have been occupied on completion!

We are not arguing that adequate regulation is not necessary in such cases. We only wish to emphasise our opinion that such regulation has in many cases been carried to an extreme point, causing annoyance and expense to private owners, and that a little control over the general character of buildings to be erected is

both necessary and could well be applied without increasing the cost of building or stifling enterprise.

We have recently legislated *ad nauseam* for the health and safety of the public, often regardless of expense, but it is open to anyone holding property to affront the aesthetic sensibilities of the public.

But the spadework that must be done is in educating and appealing to the reason of the large landowner. Anyone wishing to build on the Portman, Westminster, Cadogan, Bedford, or Howard de Walden estates will not be prevented from doing so because they find that reasonable and not onerous restraint is placed on their freedom of action in the matter of design.

We cannot imagine, for instance, that such a company as that called the "Whitehall House," which is acquiring and opening houses as residential hotels in Bloomsbury, would go elsewhere if they found they could not replace the ordinary Georgian ground-floor sash-window by a new one, the sash bars of which are in violent and unpleasant contrast to the neighbouring houses. They would submit to a restriction which applied equally to others, and pay the rents they pay now.

Nor is there any reason why the unusual and displeasing shop window used as a mark of distinction by a firm of

restaurant proprietors should be tolerated everywhere. These and other weird fancies only become necessary because of the fear that a neighbour and rival may go one better.

And such owners as the Crown need not be afraid of applying reasonable control in districts like Regent-street, provided their restrictions are evenly insisted on over large areas. Naturally, the fact that the Piccadilly Hotel front is an extreme case with a comparatively short frontage constitutes the shop-owners' greatest grievance. It is putting a comparatively small number of owners at a disadvantage, compared with their immediate neighbours, a disadvantage that would not have existed had a greater length of frontage been rebuilt.

But this is, as we have emphasised, an extreme case, and there are ways in which the shopkeepers' point of view might have been considered without the loss of architectural character.

We think in such ways as the above much might be done to save the architecture of our towns without injustice or hardship to anyone, and that without some such action being taken the standard of individual design may be raised without affecting the collective loss of restfulness, character, and dignity which is taking place from day to day among us.

THE GUILDHALL IMPROVEMENT SCHEME.

IN our present issue we give illustrations of the new buildings and plans which have been adopted by the City Lands Committee in connexion with the proposed improvements at the Guildhall, and which were to be considered by the Court of Common Council yesterday, but at too late a moment to enable us to give any report of the deliberations. We referred to this scheme in a note last week. Immediately on the issue of the Committee's report the leading newspapers gave prominence to Mr. Sydney Perks's designs, which not only indicates public interest in the proposed improvements, but also the awakening of the daily Press to the importance of matters architectural.

For some years the various operations concerned with civic government at the Guildhall—the Law Courts, the various Committees, the administrative offices—have suffered from congestion through lack of convenience of space. Further, the important collection of pictures, which is one of the chief ornaments and attractions of the City from a visitor's point of view, was inadequately housed, while the ceremonies and entertainments

The Need for Control: The East Side of Russell-square.

the important functions of hospitality which are historically associated with the City of London, occasioned a certain disorganisation of ordinary official and administrative routine, which under the present scheme of rebuilding can, to a great extent, be mitigated or altogether avoided. The machinery connected with the government of so important an authority as the City Corporation is as intricate as it is extensive, and the problem which the City Lands Committee had to solve, with the assistance of Mr. Perks, suggested many solutions, and it is only after upwards of four years' close attention to all the details, after consultation with various other Committees, legal authorities, the Library Committee (which administers the Art Gallery), and so on, that the present scheme in its entirety has been arrived at. There could, to begin with, be no question of change of site; the historic associations of something like five centuries forbade the entertainment of any idea of the sort. The acquisition of fresh property in the neighbourhood was also, in the view of the Committee, impracticable on the score of its immense cost. The Committee, besides, felt (we are speaking from their report) assured that they had enough space at their command, if adequately handled, to provide for all requirements, while maintaining the historic continuity of the contours of the site since the XVth century, so far as the disposition of the external building lines of the Guildhall and its courtyard are concerned. A scheme of covering the courtyard, either wholly or in part, which was at one time formulated by Sir Horace Jones, was dismissed, because it was found that the deprivation of light which it would entail on buildings according to the existing plan would involve changes which would not really add appreciably to the space accommodation. In addition to this consideration Sir Horace Jones's scheme would have deprived the courtyard of its quadrangular seclusion and increased the difficulties of traffic on ceremonial occasions.

So it was determined to work upon the main lines of the present site. Another problem suggested itself. The Great Hall, identified as it is not only with the history of the City, but with ceremonies and great occasions which are closely connected with the history of the whole country, must necessarily remain. But Dance's front? As we referred to this matter last week, we do not wish to dwell further on this point, beyond saying that after reading the Committee's report we are in agreement with its conclusion, that this quaint and picturesque façade should be retained. It has become an historic feature, as much indeed a symbol of civic dignity and custom in the minds of many generations of our countrymen, as the mace or sword bearer, as the great coach, which we associate with the paraphernalia of great civic affairs. But while Dance's front should be retained, we are also in agreement with the Committee's decision that the rebuilding of the collateral wings should not be modelled on the same design. Let Dance's front remain, as it ought to remain, the central feature. The east and west wings are to be devoted to Law Courts and to administrative offices.

Above the Law Courts in the east wing, which on occasion are to provide the space required for great ceremonials, there are the picture galleries, excellently lighted, reached by an ample and decorative stairway. On this side the building line is carried a little farther than the existing buildings by an arch which covers the passage to Basinghall-street to a small plot which, in effect, enlarges the present site to the exact line of frontage which existed in the XVth century.

It will be seen from our brief commentary that the City Lands Committee have had no easy problem to solve. They have had many things to consider—a circumscribed site, historic and æsthetic associations as well as the more convenient accommodation which modern exigencies demand. They have devoted four years or more to its solution, and its various members are intimately connected with the practical work of municipal administration. They have sought the advice and enlisted the services of two architects and have finally adopted a scheme which answers the requirements and which, so far as exterior design is concerned, harmonises with the general effect of a courtyard without perpetrating any archaeological imitation, which is not always easy to discern, and which, if projected in the present instance, would have no doubt provided an easy target for the shafts of adverse criticism.

THE SUBMERGED TEMPLES OF PHILÆ.

HE *Times*, in an article of the 17th of this month, calls attention to the effects of the submersion of the temples of Philæ, caused by the new Assuan dam, and the further damage which will result when the works—now finally completed—for increasing the height of the dam have caused a further heightening of the water level during the seasons of flood. A very interesting letter from an Assuan correspondent in the same issue gives an account of the manner in which the water is destroying the temples.

We all remember the protests made at the time the construction of the dam was determined on by those interested in archaeology and in architecture, but the Government of Egypt considered—as we think rightly—that the interests of the inhabitants of Egypt were too important to be subordinated to any artistic considerations whatsoever, and simply took precautions by underpinning the foundations of the temples, and strengthening the walls that they might be better able to withstand the action of the water. It is pointed out that the beauty of the temples, which is largely extrinsic, has been in great measure already destroyed by the drowning of the surrounding palm-trees and the destruction of the brilliant tints of stonework now washed into a dull grey or hidden by the growth of water weeds.

The new addition to the dam will raise the level of the waters by 18 ft., and the damage already done to the lower part of the columns will extend to the capitals and roof blocks of the famous Hall of Columns. The stone of which the temples are constructed is of a porous nature, unable to

carry much more than its own weight, and the added weight of the water absorbed, coupled with the resultant disintegration, will cause the destruction of the roof.

Steel joists have already been introduced under the stone beams to obviate similar danger in places, but since the beams are painted such measures hide the paintings, besides being otherwise hideous.

An interesting description of the process of destruction is given. The site of Philæ, like other temples, was inhabited from time immemorial by peasantry seeking the protection of the buildings, and accumulations of organic refuse have formed salts which dissolve in the water and crystallise on drying, disintegrating the sandstone of which the temples are built. In addition, the waters left in the flooded courts and passages of the temples have produced crops of water weeds and slime which cover the lower part of the adjacent columns, and then dry in the sun into whitish skin which peels off, bringing with it the painted surfaces, and hangs in tags and patches which flutter in the wind. The effect is described as being as if the buildings had been "stuck all over with dirty blotting-paper."

It seems a pity, reading the foregoing, that the proposal made for the removal of the ruins to a neighbouring island could not have been carried out, for the process described, which has now been continued for but ten years, must in a few more decades convert these once beautiful ruins of later Egypt to a shapeless and unimpressive edition of Stonehenge; but we feel that we can still join with the *Times* in thinking that the very gods of Old Egypt would have been willing to spare one of their shrines to bring such benefits to the people of the "Upper and Lower Land" as are occasioned by the conservation and spreading of the waters of the Nile.

The fulness of modern existence and the making of history in every country is bound to be accompanied by the destruction of much of the past that we have valued, and if this process were only balanced by the creation of what the world would value in the future, we need have little to regret; our mission must ever be to create a present architecture worthy to be "bound in" with the pages of the past.

NOTES.

Railways and Landscape.

THE *Times*, in a leading article last week, entitled *Beauty and Engineering*, comments on the address given by Professor Archibald Barr to the Engineering Section of the British Association on the offences committed by engineers against the æsthetic senses of the community, and Mr. Carbe has written a letter published a few days ago in which he refers to the "lucid and convincing exposition of realities which touch, so nearly our everyday life," given by Professor Barr and by the *Times*. Professor Barr points out that engineers have no right to do what is "detrimental to the health and prosperity of the community, or offensive to the senses of those who are condemned to live with them." And he goes on to instance the manner

in which the railway engineer has caused such offence. This is straight talking from an engineer to engineers, and we hope the seed has fallen on fruitful ground. When, however, Professor Barr goes on to speak of beauty as being the result of the perfect performance of the function aimed at and lays down the dictum that engineering which offends against our æsthetic sense is *per se* bad engineering, we feel he is going farther than we can follow him. We concede that it is probably quite safe to say that, given good and bad engineering, the latter will in all probability offend our senses more than the former, but as Professor Barr puts it we feel he is uttering a platitude similar to that "all things work together for good," or "vox populi vox dei est," sentiments which are comforting, but will hardly bear the cold and searching light of analysis. Many things in this life are absolutely fitted to their purpose and clearly necessary to which the expression beautiful cannot be applied. No stretch of the imagination could imagine a beautiful bicycle or pumping engine; at the best such things are negative in their effect on the æsthetic sense. But, turning from theory to fact, we are delighted to find an engineer recognising the havoc which his profession has in many cases brought on the landscape and the necessity for greater thought and care.

At a time when there is a cry for nationalising all undertakings connected with the supply of the necessities of life it may be well to point out that the abolition of competition does not necessarily make for cheapness. The Metropolitan Water Board appears to be a case in point. There is a constant outcry against the rates charged for water, and yet the Water Board shows a deficit in its receipts. It was recently stated that the loss to the Board from persons sinking artesian wells represented a large sum, amounting to some 8,000*l.* per annum—we quote the figures from memory—and it is certain that the high charges are causing manufacturers to sink for private supplies. In this connexion it may be well to draw attention to the statement made by a correspondent to the *Times* of the 2nd inst., and printed on p. 285 of our issue for September 6, that the supply of water to be drawn from the chalk bed under London is falling in level, and that a pure supply from this source cannot be looked upon as permanent as percolation from the Thames may ensue. How far this fear may be justified we do not know, but, having regard to the fall of the water in the chalk, those contemplating sinking artesian wells will do well to obtain competent advice before embarking upon an expensive operation.

Two PAPERS by Colonel Sir C. M. Watson, C.B., R.E., President of the Geographical Section, and Colonel C. F. Close, C.M.G., R.E., which were read to the British Association on September 6 describe the progress made with the production of the International Map of the World. The scheme and form of the map were adopted three years ago

by a Committee of delegates nominated by the Governments of Austria-Hungary, France, Germany, Japan, Russia, Italy, Spain, and the United States, under the Presidency of Colonel S. C. N. Grant, C.M.G., R.E., the then Director-General Ordnance Survey. The scale of the map is 1—1,000,000 metres, with the Greenwich meridian; countries using other units can use them for the values of the heights if they so desire. To cover the whole world, with the oceans, will need 2,084 sheets; for the present, the oceans being neglected, about 500 sheets—representing land—will be prepared, and of them five are already on sale: one of Northern France, two of Scotland, one of South Africa, and one of Turkey. Other sheets are also in course of production by the Ordnance Survey, and by the Italian, Hungarian, Spanish, and American Governments. If we take the earth's mean diameter as being 7,930 miles, the line of sheets along the equator would, it seems, encompass a globe 41 ft. 4 in. in diameter.

Church Property and the Finance Act.

THE Vicar of Ashbourne writes to the *Times* (on 16th inst.) that under the Insurance Act he has been required to make a return as to the value of the church and the churchyard of St. Oswald, Ashbourne, an edifice which dates from the year 1241, a task which he says he and his professional advisers find it impossible to perform. It comes as a surprise to us that the Insurance Act can in any way apply to Church property, as it might be expected that it should be exempted in the Act in express terms. This, however, appears not to be the case, and in Mr. Houston's work on the "Law of Land Values" we find the matter thus referred to:—"Ecclesiastical bodies corporate, whether aggregate, as a Dean and Chapter, or sole, as a Bishop, Rector, or Vicar, are, it is submitted, 'governing bodies,' as defined in sect. 37, in which corporations sole are expressly included, and are therefore entitled to the exemption created by that section, which also applies to many other bodies corporate or unincorporate." It will be seen, from the use of the expression "it is submitted," that this is only the opinion of the writer, and that the point is not dealt with specifically in the Act. If this is the case the sooner a test case can be submitted to the courts the better it will be, it appears to us, for the valuation of such property for the purposes of the Insurance Act seems wholly uncalled for and inappropriate.

The Royal Photographic Society's Exhibition.

THE show of photographs, forming the fifty-seventh annual exhibition of the Royal Photographic Society, at present on view at the Suffolk-street Galleries, is well worth a visit. These annual exhibitions mark time, as it were, in the progress of the photographer's skill. The work of the camera is to-day, however, so universally abundant that the eminently pictorial phase of the lens, which seems to be the aim of the members of this Society, scarcely brings anything fresh to our observation. We are now and then moved to protest against the painter's striving after results which are more

properly those which can be obtained on the photographic plate. The photographer, on the other hand, is more and more seeking to obtain the effects which are associated with the arts of painting, etching, or pencil drawing. He has developed all sorts of processes which aim at disguising that a photograph is after all a photograph; he arranges his portrait subjects after the manner of a Royal Academician, while in his landscapes he often seeks to obscure the definite results of the lens by the application, to our thinking, of a certain misplaced skill. He is not content with giving us the plain title of his subject, but often chooses some fanciful description after the manner of a painter. A number of architectural subjects, for instance, at the present exhibition are catalogued under some semi-poetic title, which is irritating when the building possesses any features of interest, and we are not able to identify it. For the most part the architectural subjects are limited to churches and church crypts, largely, we suppose, because they present effects of light and shade which require some special aptitude on the part of the operator and which come within his view of what is artistic and pictorial. It is sought, too, by some of the exponents of the art, controlled, we suppose, by the same idea, to diminish the clearness of the picture details for the sake of atmospheric effect. Some of the best photographs at the exhibition are of birds and moths, in which the purpose has obviously been to get as definite a presentment as possible of the subject. Many of the portraits are also excellent, more especially those arranged and taken by Mr. Furley Lewis and Mr. Hugo Erfurth. The camera may not always be definitely true to fact (its reputation in this respect is a little notorious), but it is a lenient prevaricator, and it is the most useful instrument for graphic record that science has given us. The present pictorial phase is largely experimental, and has no doubt aroused additional interest in the practice of the craft. It is admirably represented at the present exhibition.

Mr. Gordon Craig's Exhibition of Drawings.

MR. GORDON CRAIG is a visionary; he dreams dreams which he translates into charming drawings for stage scenery. Mr. Craig arouses a certain enthusiasm in those who are bored with the obvious in art. We admire the delicacy and imaginative quality expressed in much of his work; but we are far from being convinced as to the soundness of his theories with regard to the purpose and arrangement of stage scenery. His theory is, broadly, that stage scenery should not be realistic or archaeological, but should serve as a symbol for states of mind. He would make the *décor* a beautiful and spectacular commentary on the action of the play, on the emotions portrayed by the personages of the drama; he would, in short, establish a new formula by which the scenery would be brought into closer abstract relation with the drama and its action. Mr. Craig's theories also extend to the costumes of the theatre, if we can quite call them theories; they are indeed so wilful that we should prefer rather to call them

Watergate-street, Chester.

From a Drawing by Mr. Charles L. Pace

statements or assertions. He may say perhaps that you cannot have a Hamlet who does not wear pockets in his breeches without convincing us, without, indeed, stirring in us any mood of curiosity or argument; because the point is in any case immaterial. We remember Mr. Craig as a young and charming romantic actor; he comes, moreover, from a family whose careers form an important chapter in the history of the theatre of the last fifty years, so that his views on the art of the stage must be taken as from one who is intimately acquainted with his subject. It is well known that he devised the scenery and costumes for a production of "Hamlet" at the Moscow Art Theatre, and that this opportunity for the practical application of his views won a certain success. We should like to see him provided with the same opportunity in London; for the drawings and small stage sets now on exhibition at the Leicester Galleries, delightful as they are in themselves, can at best give only an inadequate idea of what their effect would be (the scale and conditions are so different) in the actual theatre. But

speaking of Mr. Craig's production in Russia brings to mind a Russian artist, Léon Bakst, who in his designs for scenery and costumes for the performances of the Russian ballet at Covent Garden has captivated so many of us in this country. It would be interesting, had we the space, to compare the work of these artists. They possess in common imagination and a desire for beauty, but little else. Mr. Craig's art is evolved in a sort of Celtic twilight; it is mystical, we might perhaps even say that it is in its higher aspects spiritual; it is an art of vague echoes heard before the sun sets or in the mystery of the night. The imagination of Bakst, on the other hand, revels in colour, sensuous movement, and the light of a bright sun; it is objective in so far as it seeks to realise the actual spectacular conditions in which this or that scene might have been enacted; it does not emphasise the subjective, purely personal view of Mr. Craig. Mr. Craig's exhibition at the Leicester Galleries should not be missed by anyone who takes the art of the theatre seriously. We may reject his

paradoxes, we may not agree with his theories; the main thing is that he is a genuine artist seeking to express ideas in a province of art which is at present largely governed by a sociological or merely sensuous tendency.

WATERGATE-STREET, CHESTER.

WATERGATE-STREET, Chester, can well claim to be one of the most picturesque old city streets in England. In olden times it was the main thoroughfare to the water gate giving access to the River Dee, and through which the produce from the river traffic was carried. The gabled fronts of the houses are full of quaint and curious detail, and beneath run the Rows for which the city is so famed. In the "Vale Royal" is written:—"The buildings of the city are very ancient and the houses builded in such sort that a man may go dry from one place of the city to another and never come in the streets, but go as it were in galleries which they call Rows."

On the extreme left of the first view is an interesting gabled house known as "God's Providence House," dated 1652. When the plague devastated the city this is supposed to be the only house which

escaped the pestilence. The second view is of Bishop Lloyd's Palace, dated 1615. The gables are extremely rich and elaborate, and many of the small panels are filled with carvings of Biblical subjects; the interior has some very good plasterwork. The other sketches are general views looking up and down the street. Many valuable Roman remains have been found from time to time. In 1779 a Roman altar was unearthed in very good condition, the sides of which were sculptured in bas-relief; a Roman bath was also found about the same date with columns and tiles *in situ*.

GENERAL NEWS.

Appointment.

Mr. J. Campbell Reid, A.R.I.B.A. (formerly of Paisley Technical College), has been appointed Head of Architecture, Surveying, and Building in the Northern Polytechnic Institute, London.

London University.

Among the public lectures that have been arranged at University College is a course by Mr. W. H. Ward, M.A., F.R.I.B.A., on "The French Renaissance in Architecture." The opening lecture will be delivered on Thursday, October 10, at 6 p.m., when Mr. Spencer W. Morris, Master of the Worshipful Company of Carpenters, will preside.

At King's College two courses of public lectures will be delivered during the coming session on Thursday evenings at 7.30. The first course, commencing on October 17, will be on "Domes and Vaults, their Form, Construction, and Decoration," by Professor R. Elsey Smith. The second course, commencing on January 16, will deal with "Tudor and Renaissance Architecture in England, particularly the Architecture of the Later Renaissance," and will be arranged by Mr. Arthur Stratton, F.S.A. All the above courses will be illustrated by lantern slides.

Watergate-street, Chester.

From a Drawing by Mr. Charles L. Pace.

Ordnance Survey.

The publication of the revised maps to the scale of 25 in. to the mile is in progress for the county of Surrey, and is proceeding from east to west; similar progress, and from south to north, is being made with the 6 in. to the mile maps of Berks. Copies of the sheets may be obtained from the Ordnance Survey Office, Southampton, or from the local agents for their sale, or any bookseller.

Carden Hall Destroyed.

Another old house has fallen a victim to fire, this time a half-timbered mansion situated near Tilston, which is some twelve miles south-east of Chester. Carden Hall, which was practically burned out on the 16th inst., was one of those XVth-century houses which had been so much added to and restored that it had lost its interest to the architect, but nevertheless had attractions which appealed forcibly to the lover of the picturesque. It was occupied by Lieutenant Colonel Holdsworth and owned by the Cheshire family of Leche.

Repairing Lintlithgow Palace.

The work of carrying out repairs on Lintlithgow Palace has been in progress for the past three months. An interesting part of the work has been the opening up and cleaning out of the original well of the Palace, which is located in the centre of the floor of the kitchen. The well, which had not been opened for many years, has a depth of some 40 ft. In making this excavation the workmen came upon two sculptured figures, which, however, were broken and damaged.

The Glasgow School of Architecture.

The Glasgow School of Art has reopened. In the section of architecture the director of studies is Professor Eugène Bourdon, with Mr. Alexander McGibbon, A.R.I.B.A., as professor of architectural design, and Mr. Walter R. Watson as instructor. Among the Architect-Governors and Committeemen are Dr. J. J. Burnet, Mr. Reginald Blomfield, A.R.A., Mr. Alexander N. Paterson, Mr. John B. Wilson, Mr. Charles R. Mackintosh, Mr. T. L. Watson, and Professor Charles Gourlay.

Municipal Housing Scheme, Paris.

The Government Bill to authorise the loan of 8,000,000, voted by the Municipal Council for the provision of cheap dwellings has been

Watergate-street, Chester.

From a Drawing by Mr. Charles L. Pace.

Caldicott School, Hitchin: The Chapel.

Mr. Louis A. Hayes, A.R.I.B.A., Architect.

signed by the President of the Republic. The Ministers of Labour and the Interior and the City of Paris have agreed that the City shall lend one-fourth of the sum to societies for the creation of cheap dwellings, and that the Municipal Council shall apply three-fourths to the building, acquisition, or sanitary improvement of premises but as lodgings, whereof two-thirds, upon the basis of rental value, are to be reserved to families with more than three children under sixteen years of age.

Old Roman Roads.

In a recent leading article we commented on the need of improvement to the main arterial roads between the great centres of population in view of the fact that the introduction of motor traction would bring back much of the traffic to the roads, and suggested that it might be possible to repair the old Roman roads, and so bring them again into use as the principal traffic thoroughfares of the country. We are interested to notice, therefore, that a Special Committee of the Road Improvement Association is now investigating the matter in connexion with the facilities afforded by the Imperial Road Improvement Fund.

Memorial to Lord Clive.

The statue of Lord Clive has recently been removed from Burlington House to the small garden at the corner of Whitehall and Whitehall Gardens, and adjoining Gwydyr House, preparatory to its temporary erection in this position. Its permanent situation, however, will be at the steps leading from Charles-street to St. James's Park, immediately by the entrance to the India Office, but owing to the erection of the new Government offices on the site between the Local Government Board Offices and the Park being in progress, it is impracticable at present to place it in position. The statue, which is the work of Mr. John Tweed, is a little over life size. It will rest upon a pedestal of stone, with a base about 5 ft. square. The inscription, "Clive, 1725-1774," will be cut into the front stone panel, but the other three sides will be enriched by bronze panels illustrating Clive's work in India. The statue is being carried out by Messrs. Kirkpatrick Brothers, of Manchester. Although there is a certain propriety of sentiment in placing this statue in close relation to the India Office, many people may be disposed to think that the importance of the services which Clive rendered to his country are perhaps not quite adequately recognised by the position assigned

to his monument. Apart from this aspect of the question, it is doubtful whether the steps leading down from Charles-street to the Park are of sufficient width to give a proper setting to a statue on a pedestal of these dimensions, and whether indeed they are wide enough to admit of division by any statue whatever. It will be a pity if this monument should appear too big for its position. Surely it would be possible to put up a rough model in order to realise the effect before the actual work is put in hand.

Esher Place and "Wolsey's Tower."

We learn that the Society for the Preservation of Ancient Monuments are about to repair "Wolsey's Tower," at the request and charges of Sir Edgar Vincent, of Esher Place, Surrey. The gate-house, or tower, of the "stately brick mansion" built by William de Waynesflete, Bishop of Winchester in 1447-86, and a home,

as "Asher House," of William of Wykeham, stands by the River Mole, within the finely timbered grounds of Esher Place. William I. bestowed the manor upon St. Leutrid's Abbey; the abbot sold it to Peter de Rupibus, temp. Henry III.; Edward I. gave it to the See. Wolsey, having succeeded Fox at Winchester in 1528, intended to rebuild the house. But on October 18, 1529, he was bidden to surrender the great seal and to retire to Esher, where he abided a few weeks. Queen Mary restored the lordship and manor, with the park, some 185 acres in all, as part of Hampton Court Manor, to Bishop Gardiner. Her sister bought it back again of the See in 1583. In the XVIIIth century John Lutton sold to Thomas Holles Pelham, Duke of Newcastle, all the manor (including Claremont and Waterville), excepting Esher Park and the house, which latter he sold to Peter de la Porte. Dennis Bond bought Esher Place in 1724; he sold it to Henry, the Duke's brother, in 1729, when but little more than the two gateways of the bishop's house remained. Kent made additions for Henry Pelham, retaining the present gateway for a central feature of his design. Esher Place ultimately passed by sale by Miss Pelham to John Spicer, for whom Edward Lapidge built the existing house, upon higher ground away from the river. Spicer pulled down Kent's work, but kept one of the towers and planted the ivy against its walls. The square tower is of red brick with stone dressings, and has octagonal turrets; it is four stories high, the third and fourth being machicolated. There are views by Kniff and Kip, circa 1695; T. Rocque, 1737, showing Kent's additions; a large print of the west front, 1759, by Sullivan; and two in "Surrey," 1841, by E. W. Braxley, who cites the brick newel staircase, in the roofing of which, he says, "the principles of the construction of the oblique arch (a supposed invention of modern times) are practically exhibited."

WATERWORKS SCHEMES.

The Loxden and Winstree Rural District Council have instructed Messrs. Taylor & Wallin (Mr. Harry W. Taylor, A.M.Inst.C.E.), of Newcastle-upon-Tyne and Birmingham, to prepare a scheme and report upon the waterworks for the parishes of Abberton, Peldon, Little Wigborough, Great Wigborough, Virley, and Salcott.

Caldicott School, Hitchin.

CALDICOTT SCHOOL, HITCHIN.

The chapel, illustrated herewith, is the latest addition to the Caldicott School buildings. It is constructed of red brick and Bath stone and roofed with sand-faced tiles. The turret is covered with copper. The windows are glazed with diamond-paned leaded lights with "bottle eyes." The roof principals and timbers, rood-screen, and panelling, etc., are in oak, and the floor is finished in Japanese oak. The floor and steps to the chancel are of Sicilian marble. The oak pulpit, Communion-table, and benches were designed by the architect. The east window is the work of Mr. H. J. Salisbury, and represents "The Journey to Emmaus." The contractors for both buildings were Messrs. G. Willmott & Sons, Hitchin. The architect was Mr. Louis A. Hayes, A.R.I.B.A., of Brook-street, Hanover-square, W.

CORRESPONDENCE.

Lambeth Bridge.

SIR,—This month fifty years ago Lambeth Bridge was opened to the public, when Mr. Hodge's fire-engine was the first horsed vehicle to cross over from Lambeth to Westminster.

The writer was engaged during the construction of the bridge as assistant to the late Mr. Peter W. Barlow, F.R.S., the engineer, and on June 4, 1862, first walked over the Thames from Lambeth by a temporary bridge completed that day, suspended from tower to tower on the north side, over which the first wire cable was hauled on June 10. A similar temporary bridge was subsequently completed on the south side, and by July 2 all the permanent wire rope cables, namely, fourteen on each side, were in place.

On the abutments of the bridge each group of fourteen cables—in pairs of seven—passes over a saddle-piece of the form of a sector of a circle, and the ends of the cables are anchored vertically below. It is probably not generally known that the reason of the irregularity of the curve of the Westminster span was an accident which occurred through the weight of the bridge causing the cables to raise, or rather to tilt, one of the saddle-pieces on the Westminster abutment, resulting in the breakage of a cast-iron strut holding the saddle-piece in position and the sudden lowering of the Westminster span. The noise created by the accident, about two o'clock in the morning, was considerable, and was heard some distance away. Though at each high tide, night or day, for some time the arch was lifted by means of frames erected on barges, and the saddle-piece forced back by hydraulic power to its original position, subsequently secured by the addition of tie bars to the back of the abutment and a strut to the tower, the arch never regained its proper form.

The total cost of construction of the bridge was under £50,000, including purchase of land, etc. It was acquired by the Metropolitan Board of Works in 1879 for under £30,000. In 1892 it was considered expedient to rebuild both Lambeth and Vauxhall Bridges, and it was afterwards suggested that the temporary wooden bridge opposite the Tate Gallery, erected previously to the demolition of old Vauxhall Bridge, should be allowed to remain until the completion of a new Lambeth Bridge. The temporary bridge, however, was removed, and Lambeth Bridge has been allowed to go to a state of decay through neglect, and remains in a truly lamentable condition. Had it been kept in proper repair and painted it would have shown a very different condition, and the roadway need not have been so soon closed to light vehicular traffic, to the serious inconvenience of many.

A proposal to replace the existing Lambeth Bridge by a steel arch bridge at a cost of £400,000, was rejected by the London County Council in 1910. This year the passage of a Bill introduced by them for a

similar bridge of modified design was defeated in the House of Commons; it is contemplated to introduce another Bill next year.

There appears to be great difference of opinion, some arguing for heavy expenditure to ensure a bridge of ample width to allow of tramlines, others that a more moderate scheme would be sufficient, and others, again, that the bridge should be totally abolished. In the interests of the public, the folly of reducing the facilities for crossing the river should be considered, and it should be remembered that Lambeth Bridge is on the direct line between Westminster and the Tower Bridge and a short cut to London Bridge. Failing the construction of an expensive and more suitable bridge giving greater accommodation, there is no reason why a strong suspension bridge of elegant design should not be erected on the existing piers and abutments. Clearly all superstructure would have to be entirely removed, but the writer can speak with confidence of the strength and durability of the foundations; the piers and abutments are of concrete and brickwork set in Portland cement, based on the London clay. Such a bridge would last many years, it could be erected at comparatively a very small cost; the roadway would be sufficiently wide for a moderate traffic, and the footpaths could be readily made of greater width. Surely this would be better than not having any bridge at all.

G. S. ULLATHORNE, Ph.D., M.A., C.E.

The New Wesleyan Hall.

SIR,—I have seen the announcement of the approaching opening of the Wesleyan building at Westminster. It seems to me incredible that the authorities should allow so important a building in the heart of London to remain unfinished and proclaiming its unfinished state to every passer-by.

Surely here is a case where the cost should first be counted, and, if the sum available was not

sufficient, the design ought to have been modified accordingly.

Has the local authority no power to insist on the proper completion without delay?

ENGINEER.

* * * Our correspondent may not be aware that the new Central Wesleyan Hall remains unfinished owing to the rights of light of the present Westminster Hospital.—Ed.]

Holborn Viaduct.

SIR.—An examination with a thin searcher would assure anyone that no lead had been used in jointing the stones of the columns that support this structure.

The writer, when making an examination for a defunct engineering paper four years ago, found no difficulty in penetrating the joints for a foot and more in many directions.

H. T. D.

THE TRADES TRAINING SCHOOLS.

A conversation was held on Monday evening at the Carpenters' Hall, London Wall, when the new session of the building trades classes of the Associated City Companies was opened. The director, Mr. H. Phillips Fletcher, F.R.I.B.A., F.S.I., in the course of some remarks, said that the schools were carried on in Great Titchfield-street, and were established by the Carpenters' Company and Associated Guilds about twenty years ago, the object being to assist craftsmen to master the technique of their different trades. In other words, the Company was trying to preserve individualism and to make the lifework of the craftsman more interesting. To be successful it had been found necessary not to have any set curriculum, and, so far as was practicable, each man was allowed to do whatever work in his trade he desired. Work entered upon with enthusiasm would always be useful and prove a source of pleasure and gratification.

The students were welcomed by Mr. Spencer William Morris, the Master of the Carpenters' Company, supported by Mr. J. Hooke, Mr. F. Preston, Mr. Minden Smith, and others.

The Companies which share the credit of promoting the schools with the Carpenters are the Joiners, the Painter Stainers, the Plasterers, the Tyers and Bricklayers, and the Wheelwrights.

Caldicott School, Hitchin.

Mr. Louis A. Hayes, A.R.I.B.A., Architect.

ILLUSTRATIONS.

Guildhall Improvement Scheme.

REERENCE was made in our issue of last week (p. 299) to the proposed alterations in the neighbourhood of the Guildhall, and we refer elsewhere (p. 321) to the general features of the scheme. Designs by Mr. Perks are shown on one of our plates. The top illustration represents the facade to the east block, and the plans of the proposed new building are underneath. Beneath are suggestions for the elevations to the west block and to Church-passage.

Baroque Architecture.

ONE of our plates this week is given in connexion with the third article (see p. 329) of our series on "Baroque Architecture," the first of which appeared in our issue for August 16, and the second in our issue for September 6. The plate consists of illustrations of the Fontana di Trevi and the Palazzo Doria, Rome.

R.I.B.A. Problems in Design.

The designs, by Mr. Erastwich and Mr. Dodd, reproduced as one of our plates, were submitted to the Board of Architectural Education in connexion with the new requirements of the Royal Institute of British Architects relating to the Final Examination. Both the examples illustrated have satisfied the Board.

MEETINGS.

COMPETITION NEWS.

A list of current Competitions is printed on page 341.

Cardiff Fire-Station.

Forty-three designs have been submitted in this competition, and will be adjudicated upon by Mr. A. Marshall Mackenzie.

MAGAZINES AND REVIEWS.

THE *Burlington Magazine* contains an interesting illustrated article on windmills. Essentially industrial in its functions as the wind-mill is, it has identified itself so closely with the romantic that by lovers of landscape and the South Downs especially such an article will be received as a gratifying attention. What do not Crome, Cotman, and the English School of landscape owe to the "post" mill—the oldest and most picturesque of the family? There are three very distinctive types, and anyone who stands on the jetty at Littlehampton may command the three at a glance. A dilapidated "post" mill stands away on his right at the extreme east of the town, a "smock" mill on his left at Oyming, and a "tower" mill near by in front of him. But the "post" mills are few; the "tower" and "smock" variety are scientifically their superiors in the process of milling, and the additional floors they contain render them also more economical in supervision. But life and romance lay with the old "post." It rocked when in operation like a ship at sea.

There is also an article entitled "Artist Life in the Middle Ages," which, if it cannot add much to our knowledge, is of interest. It discusses but does not remove speculation as to the personnel and position of the medieval architect. That there was such a person cannot be doubted. It was not an age of Syndicalism, and the suggestion that cathedral design sprang from a fount-head of "Comacine

Masters," or any such guild or collegiate body, invested with the mystery enjoyed by the modern order of Freemasons, cannot be entertained. It is not, however, a matter of supreme moment. That his personality should be merged in an imperishable achievement is as dignified a record as we could wish an architect to possess.

The *Connoisseur* reviews the "Taylor Collection," now dispersed. It is melancholy to reflect that it was at one time the intention of the owner, the editor of the *Manchester Guardian*, to leave his treasures to the nation, and that it was so specified in a will, later rescinded. The collection contained some cinque-cento bronzes of the greatest beauty. There is also a worthy article on Liverpool and its history, with illustrated references to its civic plate. St. George's Hall and its destinies are in the mind of not a few at the present moment.

The *Architectural Record* presents us with "Examples of Ornamental Plaster Work of the English Lowlands," with plates unfortunately described as Saffron Walden, Sussex, England. That the architecture is English is obvious. That it has nothing in common with Sussex is also obvious, and as a matter of fact, of course, Saffron Walden is in Essex. These examples of parge work are curious and executed with boldness. But designs of real beauty may be found, throughout the eastern counties particularly. They belong generally to the late XVIIth and early XVIIIth centuries. Lime, hair, and sand, the ordinary "wattle and dab" materials, are used, and the pattern, when in relief, modelled by hand. Sometimes a wooden template of the running ornament to be executed would be fixed to the wall, and the plaster face being brought up flush, and the templates removed, the sunk ornament was displayed upon the plaster. Old parge moulded floral patterns are especially beautiful.

This class of work succeeded the more refined stucco modelling, introduced by Italians in the XVIth century, such as is found at Longleat and Hardwick. This was frequently executed with great skill and fertility of design, but the homely parge work often displays a charm that is far more appealing. There is also a scholarly article on the "Architecture of Mexico City." The writer is inclined to question Richardson's choice of a model for a national type of architecture, when he sought it at Fontiers, while such types of historic interest already exists at home. Given the sunshine, the richness of colour on tile and plaster is no doubt alluring. But Spanish architecture of the XVIIth century is scarcely capable of further development. It was already overripe, "a fascinating display of brilliant littleness."

The *Nineteenth Century* has an article which can scarcely, perhaps, be termed archaeological, though dealing with an episode that figures so largely in a study of that nature—the descent of the Gods upon Rome. It is a vivid description, conceived with imagination from the pen of Professor Flinders Petrie.

The *National Review* contains a survey by Mr. W. Roberts of the progress made within recent years by the American picture collector. A list prepared in 1880 of the works of the principal old masters by that time imported is almost too inconsiderable for notice. By the year 1910 it seems that the number of Rembrandts alone had reached a total of eighty-six. Out of these eighty-six only nine belong to public institutions. A knowledge of what you are proposing to buy and a long pocket are the standard requisites of the collector. The former may be acquired or its deficiencies supplied by the assistance of agents and experts, while recent sales have established the fact that in the auction room America has the advantage. But to collect for the true and legitimate pleasure of it, you must hazard personal knowledge and judgment: it may even prove a greater commercial advantage than the mere power to bid.

FIFTY YEARS AGO.

From the *Builder* of September 20, 1862.

Utilising Roof Tops.

IN a block of building in the Pleasant Edinburgh, a novel arrangement—that of converting the roof of the house into a bleaching-green—has been carried out. The *Courant* gives the following particulars:—In the roof, which is, of course, flat, the first requirement is that it should be water-tight. To secure this the sole is constructed of thick iron plates, riveted together at the flanges and having india-rubber introduced in the manner of a "washer" between the edges. To resist corrosion the iron has been treated while in a heated state with oil which, it is expected, will act as a preservative of the metal. Over the joints of the plates asphalt has been poured, so as to assist in preventing the access of damp to the house below. Next the iron a thin layer of clay is placed, above which soil is laid, making a thickness of 12 in. from the iron to the top of the turf. The "green" is divided by walks of asphalt, so as to preserve the turf, and, at the same time, to give access to all parts of it. Round the sides the edges of the plates are turned up to the extent of 14 in., so that continuous rain to that depth must fall before the water can run over to the walls, supposing all drainage and evaporation to fail.

.* The utilisation of the roof of a building otherwise than as a box-room is assuredly a novelty no longer. Some of the large modern Stores use the roof as a café. At St. Bartholomew's Hospital there is a tennis court. Upon the pavilion on Brighton Pier there is a promenade. There are numerous instances of drying-grounds and gardens, while there is at least one apiary in the middle of London. Had methods of construction been limited to those above described, no doubt the bleaching-green referred to would be a novelty still. The specification reads more like that of part of some pre-historic ironclad than an industrial flat. The cost must have been considerable and prohibitive towards any general adoption. The use of concrete floors and asphalt as a jointless covering has made the problem an easy one. From the point of view of design, a flat roof demands that the building shall be conceived in the Classic manner, with perhaps the dignity added which size can impart. In this age of eugenics and *plein air*, the dwelling-house with a flat roof is not past comprehension: a "desirable residence" with its self-contained playground or swimming-bath should not long remain on the hands of the enterprising agent. But the high-pitched roof—a native of that part of the world in which we dwell—has its uses in maintaining an equable temperature in a house; it has fulfilled all requirements when it has proved itself weather-tight; it too often happens, however, that the moral of wasted opportunities may be applied here, for space beneath the roof is woefully wasted instead of being turned to the reasonable use which the space invites.—Ed.

ART AND CRAFTSMANSHIP CLASSES.

The London County Council announces that the evening classes held in Polytechnic Technical Institutes, Schools of Art, Commercial Centres, and Evening Schools will shortly be reopened. The programme includes classes to meet all kinds of needs. For students who are engaged in trades there are held in the Polytechnic and Technical Institute classes in all necessary subjects. Art and craft students will find provision in the Schools of Art for the study of every branch of craftsmanship. Boys and young men can obtain instruction in wood and metal work and in workshop drawing and calculation to prepare them for the Polytechnic and Technical Institutes. The enrolment of students began on Monday, September 16, and a leaflet giving particulars as to where the classes are held and as to fees can be obtained at any of the Council's schools and of the Education Officer, Education Offices, Victoria Embankment.

BAROQUE ARCHITECTURE: III.

ROMAN PALACES AND GARDENS.

(Continued from page 279.)

THE architectural labours of the Popes were by no means confined to churches, for, although, as we have seen, an incredible and perhaps disproportionate number of these buildings were erected, the pontifical energies were equally active in other channels. Their newly-awakened theories as to nepotism and the establishment of their families account for their magnificent palaces in Rome and villas in the country, while their desire to beautify and ennoble their Church and their city produced their more official buildings and their civil monuments.

What we may group as official palaces of the Papacy are the Vatican, Lateran, and Quirinal palaces, the Sapienza, Collegio Romano, Propaganda, etc. Their purpose was to house the Pontiff and his vast retinue on the one hand, the army of papal officials on the other. In modern times there have been many changes of ownership, and the crossed keys over many famous palace doors have been superseded by the arms of United Italy. Yet the Vatican and the Lateran continue in the unbroken succession of many centuries.

It was some five hundred years after Christ that the first Popes came to dwell in

the Vatican, but it was a thousand years later when the Renaissance Popes increased it to any great size.

Nicholas V. decided, about 1450, to make the Vatican the most imposing palace in the world, uniting under its roof all the offices of his Government and all the dwellings of his cardinals. In the ensuing century the first library, the Appartamento Borgia and the Stanze, the Torre Borgia, Sistine Chapel, Belvedere, and Bramante's great court were erected. This, then, was the extent of the Vatican at the beginning of the Baroque period.

The lovely little casino in the gardens—the Villa Pia—is the first building for us to notice, but it barely seems to belong to the Baroque style, rather to that vague category of villas and garden-houses which includes the Pamphili, Medici, and Borghese villas, and which is neither pure Renaissance nor Baroque. Here, as in the Villa di Papa Giulio which preceded it by several years, the architecture seems to breathe the spirit of classic times, perhaps recalling the days of Imperial Rome with its rich and almost debased refinements in marble.

Sixtus V. left his mark upon the Vatican buildings; and of his additions the

best known is the Library, which divides Bramante's enormous court into two parts, the Cortile di Belvedere and the Giardino della Pigna. But between 1585 and 1605 was erected that strange amorphous group which has now become the real home of the Popes, the greater part of the palace being devoted to art collections. Fontana adopted a façade closely resembling that at the Lateran, which he was building simultaneously, a simple Late Renaissance treatment with a good cornice.

Maderna's work at the Vatican is limited apparently to the water-garden; and Bernini, who followed him, has left only one example of his art, but that is a masterpiece.

The Scala Regia is more than a staircase, more than even a royal staircase need be; it is one of the greatest achievements of the Baroque period. Critics will differ as to the legitimacy of his scheme for lengthening the vista by diminishing the width of the stairs the whole distance up to the landing. Yet the effect is wonderful, and compares favourably with some of the famous instances at Genoa or in the gardens of the villas at Frascati. In the matter of staircase design, the Baroque period stands superior to any other epoch in architectural history.

Palazzo della Consulta, Rome.

[Photo. by Gargioli.]

Lastly, it might be noted that much building has been done at the Vatican in more modern times by Pius VI. and Pius VII., and even recently.

The Lateran Palace is more compact and less straggling in arrangement. From early Christian days down to the XVth century it was the official dwelling of the Popes, but, as we now see it, it is largely the work of Domenico Fontana, who "restored" it in 1586. It consists of a group of buildings round a square court with arcades. For some seventy years it has served as a museum to contain part of the incomparable treasures of the Popes. In appearance it closely resembles Fontana's work at the Vatican, a great façade crowned by a heavy cornice, fifteen windows in the whole length and three stories high, with a rusticated central doorway.

The Quirinal Palace, now occupied by the King of Italy, was formerly a summer residence of the Popes, to whom its healthy situation appealed. It is also largely the work of Baroque architects, having been begun in 1574 by Flaminio Ponzio.

The remaining official buildings of the popes are of no great architectural importance here, though often on a considerable scale, and the rest of this chapter may better be devoted to other matters.

The greater private palaces of Rome are, with a few exceptions, the residences of families whose fortunes were made when one of their members became Pope, and dating in no case earlier than the XVth century. The Palazzo Venezia and the Palazzo Colonna, though differing so much in general appearance, are not separated by a wide span of years.

The growth of Roman prosperity in the earlier part of the XVth century, however, is marked by a succession of large palaces by Bramante, Peruzzi, and Sangallo, and by their successors—Michelangelo and Vignola, in whose work, we are told, may first be discerned the "germs of the Baroque corruption." Putting aside for the moment all buildings outside the city proper, we find that Sangallo and Michelangelo's Palazzo Farnese represents the culminating point of the pure Renaissance palaces, and perhaps the prototype of the sumptuous Baroque designs which followed. In the work of Fontana at the Vatican and Lateran the influence of the Palazzo Farnese is easily to be traced, and one may assume that it was regarded even in those days as masterpiece. In Lunghi's Palazzo Borghese we notice the same motive, an immense

g and lofty façade, with a great cornice
a simple system of fenestration, ornament
restricted to the central doorway. Yet
design is in most ways inferior to the
ness. The courtyard of the palace is
rimingly treated with coupled columns
arches.

This building was bought by Paul V.
ing its construction for one Cardinal
zza, a Spaniard, and was eventually
pleted by Flaminio Ponzio.

Martino Lunghi also built the Palazzo
emps (1580), and to this same semi-
roque period belong the Giustiniani,
icellotti, and Ruspoli palaces.

Montaigne, in his visit to Rome in 1580,
es some account of life among the grandes
the city, and appears astonished at the
liance of Rome and its people, which he
sidered comparable with his beloved
is. In those days French influence
manners were in the ascendancy, for
was many years before Spanish etiquette
l completely altered the face of things,
l reduced the occupations of the
stocracy to making a display and con-
vening with tables of precedence. Yet even
1580 Montaigne tells us:—

"The city is all for the courts and
nobility, every one adapting himself to
the ease and idleness of ecclesiastical
surroundings. There are no main streets
of trade; what there are would seem small
in a small town, palaces and gardens take
up all the space.

In the palaces the suites of apartments
are large, one room after the other, and
you may have to pass through three or
four rooms before you come to the chief
saloon.

In certain houses where M. de Montaigne
dined in ceremony the buffet was not set
in the dining-room, but in one adjoining,
whither the servants would go to fetch
drink for whomsoever might call for it;
here, too, was displayed the silver plate."

Of the palace gardens he says that the
most beautiful are:—

"Those of the Cardinals d'Este at
Monte Cavallo and Farnese at the
Palatine; of Cardinals Orsini, Sforza, and
Medici; of Papa Giulio and of Madama;
those of the Farnese and of Cardinal
Riaro in Trastevere, and of Cesio outside
the Porta del Popolo."

In the XVIIth century many more palaces
were built, the Palazzi Sciarra (1600),
spignoli (1603), by Ponzio, Mattei (1615),
Madama, Barberini (1626), Madama
(42), Pamfili (1650), Altieri (1674), and
oria being the most important.

The Palazzo Sciarra was built by Cardinal
rberini, who may have bought the site for
gardens existing there, which were
eady laid out. These gardens he embellished
ll further, and the beautiful fountain
orned with cupids is of the Baroque period.
e façade of the palace is still simple in
aracter, the "barocco corruption" is still
sent, but to most architects its virile
es will appeal far more than do the
tenuated pedantries of a hundred years
fore. It is what is technically known as a
oroughly architectural design, and only an
chitect thoroughly grasps what that means.
e huge Palazzo Barberini, too, though
is the joint production of the three most
pical Baroque architects—Madama, Borro-
ini, and Bernini—does not suggest a
sordered imagination, but rather a highly-
veloped sense of the magnificent. The
ade is infinitely more dignified than the
alazzo Giraud, infinitely more restrained
an the Palazzo Spada, or even than some
those sacrosanct but confectionery-like
ildings of the Renaissance in some of its
eliter and, as we are told, more palmy days.
he staircase may be original in its grand
iral sweep, but the Doric Order—unem-
lished and simple—is employed. Nor is
ere anything despicable or extraordinary,
anything that is not palatial, dignified,

and grand in the great gate-piers at the
entrance.

Our next two examples, it is true, dating
from the middle of the century, display
more freedom, perhaps almost to the point of
licence, in some of the decorations.

Thus the façade of the Palazzo Madama,
built by one Marucelli, though carrying out
accepted tradition in its proportions and
fenestration, has all its features accentuated
by ornament, and the exterior of the
Palazzo Doria in the Corso leads us one
step further on what we are assured is the
downward path. Its interior courtyard is
restrained enough in design, dignified and
grand, again with the Doric Order. Its size
is colossal, larger than the royal palace of a
small State and capable of sheltering a
thousand inmates, as indeed it has done.
But taking these XVIIth-century palaces
strictly on their merits, putting aside the
disrepute which has accrued to them all
through the Victorian era by reason of
prolific criticism, can we as architects abuse
them? Are we bound to accept a mass of
opinion when we admit that very little
of what is written about architecture is
written by capable architects? When we
know perfectly well that a building in the
style of the Cancellaria or the Giraud palaces,
of the Pazzi chapel or of Giotto's campanile,
would be rejected in any competition on its
merits; when we realise that almost every
eminent architect who has mentioned Italian
architecture in recent years has protested

against sweeping criticisms of its later
phases, can we in honesty curse the Baroque
with candle, with bell, and with book
simply in deference to the bigoted views
of a few enthusiastic but narrow-minded
amateurs?

The XVIIth-century palaces of Rome are
expressive of the age in which they were
built in the sense of their magnificence,
their love of display, and their dignity;
but to say that on this account they are
false in construction and overloaded with
ornament is manifestly absurd and out of
accord with obvious facts.

We cannot claim that they surpass the
Farnese palace in elegance; we contend that
they are worthy of comparison with the best
work of the Renaissance, and far superior
to some of its earlier examples whose value
—like that of South Sea idols—is derived
more from their place in artistic develop-
ment than as examples of the world's
greatest art.

* * * * *

It may seem strange to any who have not
considered the subject that a hard-and-fast
line should be drawn between the town
houses of the Popes in Rome and the villas
and gardens which lie just outside the city,
or at most a few miles away on the Alban
Hills. For there is not the same apparent
difference in planning and design as in the
case of modern English town and country
houses as we know them.

Palazzo Belongnetti, Rome.

[Photo. by Gargolli.]

Fountain at Albano.

Nor may it have occurred to the reader how much these villas are bound up with the Baroque period.

Of late years it has become fashionable to take some notice of the old gardens of Italy, and several sumptuous volumes have appeared illustrating and describing them in detail. It is not surprising to find architects figuring as students of this phase of Italian art, for there is much to be learned by a careful study of the subject, more indeed than appears at first sight.

What the Baroque architect realised so fully was exactly that quality which has only just begun to dawn on the mind of the modern Englishman, that the effect of a house depends very largely on its setting. We might even go further and say that the former cared more for the setting than for the house itself, and perhaps a reason for this may be found later.

The "villa habit," if so we may describe it, was largely the outcome of climatic conditions, and was especially welcome in Rome. For malaria still hangs round the city in the summer months, and must have been far more virulent before men knew of any precautions with which to meet it. This disease is chiefly prevalent in marshy and low-lying country, so that the majority of villas are found either on the hills immediately surrounding Rome or on the more distant and loftier slopes of Frascati.

The Romans built villas long before the XVIth century. The Villa Adriana at Tivoli, for instance, was erected a little more than a hundred years after Christ, while Tuscolum, almost on the site of modern Frascati, was a favourite summer resort in classic times. The villas of Pliny and Mummius have been exhaustively dealt with by many writers, but the chief value of these researches is that we are thereby enabled to trace a close and exact parallel between the Roman country houses of pagan and of papal times, and thus to add yet another to the long list of similarities between Rome of the Emperors and Rome of the Popes.

During the Dark and Middle Ages villa life and the cult of gardens alike waned, the country house being fortified against marauders, while gardening was restricted to domestic requirements and a patch of vegetables was often all that was to be seen from the close-barred windows. Moreover, this fortified state is said by some to be reflected in the massive basements of the later Frascati villas, where the incursions of brigands from the lonely hills was a constant dread.

Although there are a few precious and isolated examples, a little group of villas and gardens of the early XVIth century indicates the revival of interest in this branch

of art and the gradual return of Rome to its classic past.

In ten years or so we find four well-known examples being laid out—the Villa Madama just across the Tiber (possibly by Raphael), the Palazzo del Te at Mantua, the Palazzo Doria at Genoa, and the Villa d'Este on Lake Como, all on more or less formal lines.

By the time that Vignola and Ammanati were at work on the Villa di Papa Giulio (1550) some general principles of garden and villa design had become established, and these may well be considered here before passing on to the later examples.

The villa or casino varied greatly in size, sometimes being very little more than its name implies in England, at others attaining to the scale of a great mansion. It is perhaps too much to say that the villa is subservient to its garden, but it is never too large for the garden. The internal arrangements were invariably simple, and did not cater for the more complex life of a town. The rooms, though often lofty and richly decorated, were few in number, usually *en suite* and without any connecting corridor.

Their architecture may be divided under three heads. The classic refinement of the Villa Papa Giulio and the Villa Pia in the Vatican Garden developed into the peculiar design of the Villas Medici, Pamphili, and Borghese, where a new style seems to have been evolved particularly suited to the purpose—a style not at all suited to the street of a busy town, but capable of execution in stucco. Then we have such grandiose buildings as the Villa "Aldobrandini" at Frascati, most bombastic of all, but not, one feels, so well adapted to a garden, however splendid; and, lastly, there are such simple and unpretentious country houses as the Villa Torlonia, also at Frascati, where the style can hardly be defined, being rustic and cosmopolitan.

Yet the fact undoubtedly remains that these houses are unimportant. Their sole interest is as a part of a garden scheme, of which they invariably formed a centre.

Nearly every famous villa in or near Rome lies upon the slope of some hill, and its position on the site is always contrived with consummate skill. An axial line is usually taken from the main entrance to the grounds through the centre of the house and beyond, and a formal treatment is adopted. But the whole triumph of this Italian garden design lies in its adaptation of nature to a conventional treatment, for, as Percier and Fontaine have happily phrased it:—

"It is art which has adorned nature, and not art which has wished to create it."

So the main principle of these architects seems to have been to lead one in gentle stages from the saloons of the house to a formal terrace with balustrades and statues, from the terrace to a formal alley between close-clipped ilex hedges, from the ilex walk to the rustic wilderness of the *bosco* or wood beyond. Occasionally more of a contrast was aimed at, so that in the *bosco* one came unexpectedly on the main axial line of the house prolonged in cascades and terraces.

The power of the Italian sun accounts for the almost complete absence of flowers, so apparent a want to English eyes, yet not so much in Rome where the brilliant rays cause one to demand but two things in a garden, shade and running water. Of these there is always abundance, and at one period the hydraulic engineer contested with the architect the post of chief importance in a garden. His task was not only to supply water for the cascades and fountains of every kind, which are so prominent a feature in all these gardens, but in some cases to devise "quaint conceits" for dousing the delighted guests of the cardinal or other lordly owner. In full accord with the broad and lusty humour of Shakespeare's day is the extract from Evelyn's diary at Tivoli many years later, where he talks of "many devices to wet the unwary spectators, so that one can hardly walk a step without

wetting to the skin." Of the same delicate character was that collapsible island, Isola Bella, where the house-party—happily watching the sunset—gradually sank in the lake till drowning was sufficiently imminent to proclaim the joke complete. Montaigne tells us, too, of organs played in water, of chirping birds and unexpected owls appearing, and of many scientific tricks of the sort, though he had seen the same things elsewhere, he says.

These general remarks on Italian gardens describe as far as is possible in a few paragraphs the gardens of the Baroque villas in and near Rome.

The most important examples in Rome are the Villas Borghese, Chigi, and Corsini at Frascati the Villas Aldobrandini, Borghese, Falconieri, Mondragone, Muti, Lancellotti and Torlonia.

The Villa Medici (1540) in Rome is early to be strictly considered as Baroque and the Villa Albani (1760) almost too late.

No man who has ever travelled through Italy needs to be reminded of the charm these lovely gardens, their silence and peace, their coolness and their dignified perfect blending of architecture and nature. But as he climbs their stair flights of steps or leans pensively over moss-grown balustrade of some silent forlorn lake at Frascati—the cypresses stand black around him, the dome of St. Peter in the purple distance—he should remember that these dreamily beautiful places are solely the creation of the despised Baroque architects.

We have now passed in review most of the work of the Popes in Rome—their church palaces, and their villas—but we have still to mention many things, some of the hardy buildings, which they built in the city.

We have some idea of what Rome would be stripped of her Baroque churches, palaces, of the many empty sites and ragged streets which would be left. Yet to some people this would be no loss, and one might imagine some—of more than usual enthusiasm for the work of approved period—who would not notice the difference if, three-quarters of Rome were spirited away. But even to such people, even to some of those great critics of art who are so vituperative about Baroque, we think there is something which must appeal.

Rome without its fountains, its public places, and its central features, would hardly be Rome at all. And, with a few trifling exceptions, all these fountains are Baroque. Their variety is infinite, but their effect

Bernini's "Scala Regia," Rome.

ally admirable. There are one or two which can hardly be classed as fountains, as the Acqua Paola in the Janiculum. Its strange erection is one of the very worst functions of the period, and, in view of its prominent position, is one of those undoubted ones which have brought the style into a disrepute. Meaningless, huge, and it was set here by Paul V. (that Pope), in derision, was christened by the palace "Fontifex Maximus" to signalise an otherwise fine achievement in bringing a good supply of water to Rome. In striking pleasant contrast is that equally famous but less prominent work, the Fontana di Trevi, erected in 1735 from the designs of Giovanni, one of the happiest efforts of the later rococo period.

Of another very different type is the series of fountains in the Piazza Navona, one of which is the most successful work, where the effect is all the better as the whole tone of the piazza is Baroque. Then there are the numerous other examples scattered through the city, most of them picturesque and roughly admirable, a few (such as the Fontana di Piazza) merely bombastic.

And, lastly, we have these schemes which cannot be classed as buildings at all, the Piazza di S. Pietro—admittedly one of the most impressive things in Rome—the Piazza del Popolo, the magnificent steps in the Piazza di Spagna, and the monumental approach to the Capitol. There are many other places we might mention of the same type; there were schemes of an equally wild nature (such as Carlo Fontana's for forming a great piazza behind St. Peter's) for opening up (the Borgo), but if the rococo style in Rome is to be criticised, we who are again studying the problems of town planning remember how large a part the greatness and the peculiar fascination of Rome is due to the genius of some of her builders in the XVIIIth century. M. S. B.

AN OLD KINGSTON INN.

KINGSTON-ON-THAMES, a town of note in the past, possesses many interesting memorials of other days. Memories of Roman and Saxon, Saxon and Tudor, Cavalier and Roundhead cluster round its name, and it is the purpose of this note to recall one of the old inns, the "Castle," the last traces of which are now disappearing before the housebreaker. Kingston always had a reputation for its inns, and a goodly number they were, too, most of them standing on the market-place. The subject of our sketch, known latterly as No. 5, stood between two others, the "Sun" and the "Griffin," on the western side. The three were of ancient foundation, the "Griffin" dating from the times of Edward VI., and were much used as posting inns. The "Castle" dates back before 1626, for in that year the valuation of the tithes of the vicarage shows the inn paying 3s. 4d. The building at one time must have presented an interesting appearance with its courtyard and galleries, and no doubt founding in relics of the past, for during the Civil War the soldiers of Cromwell and of Fairfax were quartered there, and many stables of all periods have rested from their turnings in the inn. In the middle of last century it was converted into dwelling-houses, and then into a furniture store to make way for modern accommodation for which the old buildings have been recently destroyed.

The chief glory of the house, however, was the fine oak staircase, which dates from the end of the XVIth century. It is extremely old, and shows the fanciful spirit of the age in its vigorous and heavy carving.

Of the familiar novel type, it is remarkable for the elaboration of all its features. The newels are square and solid, with small carved panels in the upper portions above the massive handrails in which are placed masks of bacchanals. The lower portions of the exposed newels are enriched with a vigorous grape-vine ornament. The strings are boldly moulded and carved with laurels, while in place of the usual beaded balustrade, common at the period, the richly-moulded handrail is supported on carved panels, in which allusions to the hospitality of the house in the form of barrels, etc., are prominently placed. The finials to the newels

are mostly balls on pedestals, but on one or two they are replaced by small Bacchus-like figures riding upon tuns.

A curious series of initial letters is inscribed upon the upper parts of the newels; for instance, one bears the letters I O R P G V P, another C B, E B, S B and A B. These two last pairs, by the way, are also found with the dates 1651,

1656 (? 1636) stamped upon the bricks of which the back portion was built.

Such, then, is all that now remains of the old "Castle" inn, and it is to be hoped that in the future the old staircase will be as accessible as it was in the past, and that its quaint carving and solid construction will preserve it for time to come as an important specimen among the now rapidly-vanishing examples of our ancient domestic architecture.

BRITISH MUSEUM.

In the annual report on the British Museum, just presented to Parliament, it is stated, *inter alia*, that during the year 1911 excavations were conducted on behalf of the Museum at Jerabab, on the Rupbrates, the site of the ancient Hittite town of Carachemish. Sculptures and inscriptions of considerable interest were found, together with a large amount of pottery, which will be of great assistance in fixing the dates of other Hittite sites. The excavations, which promise to be of considerable importance for ancient history, are being continued this year.

Recent accessions in the Department of Egyptian and Assyrian Antiquities include a mastabeh door bearing the very rare cartouche of Psammetichus III., and a very fine seated statue of a scribe and architect named Senmut, about 1550 B.C. The Department of Greek and Roman Antiquities has been unusually fortunate, having obtained at least three accessions which may be counted as of first-rate importance. One of these is a very fine sepulchral relief of the IVth century B.C. of exceptional size, another being a bronze chariot of the VIth century B.C., found near Orvieto, and now restored on a modern core of wood—an object of a very rare class, in a good state of preservation. The Department of British and Medieval Antiquities has, as so often before, owed a very large number of its accessions, including some of the most important, to the generosity of private benefactors. A beautiful set of church plate from the Hospital de la Vera Cruz, near Burgos, in Spain, was presented by Mr. J. Pierpont Morgan. A very important collection of Late-Keltic antiquities, of about the 1st century B.C., found at Welwyn, Herts, and acquired by the late Mr. G. E. Derang, was presented by his daughter, Mrs. A. J. Neall. It would be impossible, the report adds, for the Museum to maintain the

opposition which general opinion, both at home and abroad, assigns to it if the purchase grant voted by Parliament were not largely supplemented by the enlightened liberality of many benefactors, great and small. The number of desirable objects which come into the market annually is so large, and the money value of the more important specimens has risen so greatly, that no Parliamentary grant could be expected to suffice to meet all demands, and it is therefore all the more satisfactory to know that private individuals, rich and poor, are now recognising the claims of this form of national service.

BUCKINGHAM PALACE.

UNDER the directions of the Office of Works a firm of contractors is making a complete "measuring up" of the fronts of Buckingham Palace, and several travelling cradles have been adjusted in position. It is understood that the operations are intended to provide data upon which to base estimates for an entire renovation, or alteration, of the Palace façades. On July 13, 1837, Queen Victoria first occupied the Palace, built, at a cost of nearly 500,000*l.*, by Nash—the drawings were made by his pupil, Charles Mathews, the comedian—to take the place of Buckinghamshire House, built in 1703 by Captain Wyndham or Wynne, for John (Sheffield), Duke of Buckinghamshire and Normanby, on the site of Arlington, formerly Goring, House, which he had bought in 1689 of Isabella, Duchess of Grafton, daughter and heir of Lord Arlington. Sir Charles Sheffield in 1761 sold the mansion, which was settled upon Queen Charlotte as the "Queen's House" in lieu of Somerset, or Denmark, House in the Strand. In 1847 Blore added to Nash's palace the east front, 350 ft. long, facing the Mall, and set forward the railings. Nash designed also the entrance into the Queen's Mews, which cost nearly 64,000*l.* Blore's estimate of 150,000*l.* for the new works included an extensive rearrangement in the north and south wings, new kitchens, guard-house, etc., and the park gates at Buckingham Gate; the south ballroom was added subsequently. A view of the "Queen's House" is given in our issue of July 6, 1901; in the Grace Collection is a valuable set of plans, copied by Frederick Grace from the originals, of the Goring Estate and Sir Charles Sheffield's land, the Mulberry Garden—now the palace grounds—as planted, *temp.* James I., by William Stallenge for cultivation of silkworms. In Weale's "Designs of Ornamental Gates, etc., of the Royal Parks" are illustrated Vanbrugh's designs of gates, in or about 1737, for Buckinghamshire House.

HISTORICAL NOTES.

Quarr Abbey Church, near Ryde.

ON October 12, the feast of St. Wilfrid, Patron of the Isle of Wight, the Right Rev. the Bishop of Portsmouth will consecrate the completed permanent church of Quarr Abbey, erected in close proximity to the site of the original mediæval one. Monastery and church are all in brick, and the church walls inside, having no plaster, are consequently very effective, and the treatment of arches and window-heads and the curious feature of interior arcing in front of the transept window lights is very original. The whole practically of the monks' choir and the chancel are included in a huge square lantern with corner turrets, and a small space for the public is placed at the west end of the part for the monks, divided therefrom by a low arch, over which, on the eastern side, will be the organ, invisible to the public. The west front has a very wide entrance, with the springing about at the ground level, and no west window. A lower south-west corner turret will contain some of the bells, for it hardly looks feasible to crowd the four into it; the north-west corner turret has a circular upper staging closely pierced with narrow openings whose heads are treated in the same curious way as the minor arches in the church—that is to say, by overlapping brick-ends. A high conical roof of flat tiles crowns this turret. When the church has been consecrated the present iron one will be pulled down, and on its site the south walk of the cloister will be erected. The monastery and church are very conspicuous from the sea and also from most of Ryde Pier.

Ruthven Castle.

THE historic Castle of Ruthven, now known as Huntingtower Castle, which stands on a ridge between the rivers Tay and Almond, near Perth, and forms a landmark in the surrounding country, has been transferred to the State under the terms of the Ancient Monuments Act, and its repair and preservation is being taken in hand by the Board of Works. The portions of the medieval structure now standing are two massive battlemented towers which are connected by a building of later date, containing a wide oak staircase. For a century or more the castle has been divided up into tenements and inhabited by a number of families, but only the two dwellings in the western tower are now habitable, the rest of the interior and the exterior generally being in an almost ruinous condition. The pointing and grouting of the walls has been begun after the removal of the creepers and even trees, which grew upon them, and where necessary missing and decayed stones are being replaced, and the roofs made weather-tight. In the upper story of the eastern tower a finely-painted oak ceiling, discovered a few years ago, is being cleared and cleaned, and the fine groined vault of the room below, which has for some time been used as a parish room, will also be cleared of its many coats of yellow ochre.

The British Association and Megalithic Monuments.

AN interesting discussion which took place at the British Association on the origin and mode of construction of megalithic monuments revealed wide divergences of opinion among the savants who took part in it. The President of the Section, Professor Elliot Smith, maintained that the origin of such structures was dependent on the use of metal tools, that with their help the megalithic tomb architecture of Egypt was evolved some 4,000 years B.C., and that it spread from Egypt in the course of the succeeding millennia along the Mediterranean basin to Western Europe, and through Asia to America, in some cases outstripping the knowledge of metal working. With this view Mr. T. Eric Peet on the whole agreed, and added that it involved great racial movements. Professor Boyd Dawkins objected to the inclusion of the cut stone monuments of ancient Egypt in the term "megalithic," and maintained that there was no evidence that the Egyptians were the first to use metals.

Professor Flinders Petrie denied any necessary connexion between the use of metals and megalithic building, and pointed out that in Egypt all the harder stones were dressed with stone hammers. The long passages of Egyptian tombs represented the type of habitation of a people fighting with the cold, and must have originated elsewhere.

Professor Bosanquet contended that the fashions of stone architecture were not carried so much by racial migration as by wandering craftsmen, and in some cases by sailors. Dr. Ashby also remarked that in Cornwall the conclusion now being reached was that the arts of building were introduced by individual immigrants, adding that the houses of the living and the dead were not the principal megalithic monuments.

THE annual report of the Tintern Abbey. Commissioners of Woods and Forests makes some reference to the steps undertaken for the preservation of Tintern Abbey. It is stated that the whole of the west front has been cleared of ivy and other growths which were damaging the structure; the stonework of the gable and walling generally has been secured and the gable protected and pointed with cement; the stonework of the large window was found to be in a very dilapidated condition, some of the mullions being much bent and out of the perpendicular, cracked and shaled and burst with the iron bars fixed therein, etc. Saddle bars of copper, instead of iron, have been introduced between the mullions in suitable positions to steady them; the tracery has been secured, where necessary, with copper clips and bands; all points where water could lodge have been carefully filled in, and the whole has been grouted and pointed. The south-west buttress has been reset to a sufficient height to meet and strengthen the broken and dangerous part of the south side of the gable. The whole of the clearestory on the south side of the nave is in a bad state, and a scheme has been prepared to deal with it.

Old Jordans Farm, Bucks.

PASSING by Milton's cottage in Chalfont St. Giles, and ascending the Dean, or rather Dene, way to the hamlets of Three Households and Twitchells, we enter, near the Grove, into the heart and shrine of "Puritan Buckinghamshire." For at the foot of the steep decline we see Old Jordans Farm, and in the leafy hollow the adjacent burial-ground and meeting-house, whilst beyond are Stone Dean, and the woods of Wilton Park upon the opposite hill. The farm buildings have just been restored and readapted to what Jordans, or Jourdans, was more than two centuries ago—the Quakers' "Guest House." There, in William Russell's homestead, would forgather the Penns from Ruscombe, the Ellwoods and Peningtons from Bottrills and the Grange in Chalfont St. Peter, and many of the community from Coleshill, Penn, and round about. Russell sold in 1671 to Thomas Ellwood for the Quakers the graveyard that nestles in the hollow almost hidden by the trees; the meeting-house, so plain and simple, is itself an emblem of retreat and peace. Three rows of small modern headstones near the wicket-gate mark the graves of the founder of Pennsylvania (1718) and Hannah, his second wife (1726), Mary Ellwood (1708) and Thomas Ellwood (1713), John Penington (1710), Springett, Penn's eldest son (1696), Guilielma Maria, Penn's first wife (1693), and their daughter Guilielma (1689), Mary (1632) and Jane (1679) Penington, and "5 children of William Penn." The upper slope is an addition made in 1748 by Samuel Vandewall, whose family vault is beneath the limes. The meeting-house of temp. James II., replaced for that purpose the Grove whence Sutton, founder of the Charterhouse, led his wife, Elizabeth Dudley, daughter of John Gardvner.

The Treaty House, Uxbridge.

IN the course of next month the carved oak wainscot and panelling of the principal two rooms of the "Crown and Old Treaty House" will be removed, having been sold by Messrs. T. Wethered & Sons, brewers. The house has suffered many alterations since it was built near the bridge across the Colne, by one Bennet, in 1575; it was afterwards occupied by an Earl of Northumberland, and then became part of a well-known coaching-house by the sign of the Crown, on the road to Oxford, Worcester, and Birmingham. In February, 1644-5, negotiations were opened therein between King Charles I. and his Parliament—the Royal Commissioners choosing the then Crown Inn, and the Parliamentary Commissioners the George Inn for their respective headquarters. The two parties met in the large front room, since subdivided into two; the Treaty Room, commonly so-called, is the finely-fitted apartment on the first floor, and has a handsomely carved chimneypiece. There are drawings of the two inns in the *Mirror*, November, 1831, and by Prout and others in the Guildhall (City of London) Library collections.

Segedunum, Walsend.

IN the course of excavations made at Walsend on the site of the Roman camp of Segedunum have been discovered parts of the east rampart of the eastern gateway, together with a wall of the north guard-chamber in the gateway, and parts of the garrison quarters. Traces of a gravel road traversing the camp between the eastern and western gates and of a cross-road have also been laid bare. Segedunum was so named as being an emporium for corn; it was garrisoned by the first cohort of the *Lepi*, who were quartered there, at the east end of the wall of Severus, to protect the shipping in the Tyne, and it was an important trading colony of the Romans.

Old Paris.

THE Passage du Pont Neuf and an old house in the Rue Mazarine will disappear in a clearance which is being made for extending the Rue Guénégaud to the Rue de la Seine. The house is that which in the reign of Louis XIV. formed the Théâtre Guénégaud, which, in 1671-2, served for opera; it was used for the performances of the united Marais and Molière companies, and finally in 1680 became the home for several years of the Comédie-Française.

It is announced that the Baths of Bath. City Council have decided to adopt the principle of leaving the bathing establishment to the Bath Development Syndicate. The Syndicate propose to erect a new suite of baths and hotel; their scheme involves a dealing with Bath-street and the now vacant Grand P. Room Hotel, at a total estimated cost of 135,000.

Palace of Domitian, Rome.

AN excavation in the site of the Palace of Domitian the Palatine has revealed the bases of the columns which sustained the Throne Room, also an altar and a secret passage passing the Imperial apartments to the Lararium, a room, identified as the latter, wherein Penates were kept. There have also been found the foundation of the Golden Hall with pre-Roman remains, and, it is said, some ancient lifts. The clearing of the Altus will afford a view of the great Impluvium which the water was distributed from No. aqueduct in leaden pipes 15 ft. below.

A Blake Museum, London.

THE Blake Society, whose Sir William Blake Richmond is President, have in view to establish a "Blake Museum" in London. Of houses in London associated with his memory we may mention that in Hercules-buildings, Lambeth, and Nos. 17, South Molton-street, and 23, Broad-street, Soho. His home Fountain-court, Strand (south side), where he died, and Green-street, Leicester-square, have been pulled down, but one may yet see farmhouse, at North-end, Hampstead Heath where he visited the Linnells.

Hill House, Dunfermline.

THE Earl of Elgin is resolved to carry out an alteration and extension of Hill House, Dunfermline. The mansion, it is believed, built in 1623, and a designs by Inigo Jones, for William Montagu of Radcliffe, who obtained a charter for lands in 1622, having acquired them in previous year.

Maumbury Rings and Lake Villages in the West.

MR. H. ST. GEORGE GRAY, Taunton, and Dr. Bulmer have resumed for the Somerset Archaeological and Natural History Society their excavations of Meare Lake Villages, Somerset; and Mr. Gray, assisted by Charles S. Pridemore, will direct the investigations in Maumbury Rings, the site reputed of Roman Dorchester, which, begun in 1875, were suspended last year, under the auspices of the Dorset Natural History and Antiquarian Field Club and the British Archaeological Association. In the course of a recent excavation at Gillingham School have been found at a depth of about 10 ft., portions of an ancient bed of sand and pebbles, interspersed with stout oaken piles, together with broken worked flints, scrapers, and celts, comprising a red deer's skull, an antler, and the tooth-jaw-bone of some large herbivorous animal. The antler tines are in part sawn away, set singly with a jagged tool. These vestiges of lake villages are by some considered to be much more ancient than those found in the similar lacustrine settlements of Meare and Glastbury.

A London Watch-House.

A RELIC of the old days, the Watch-House of St. Botolph, Bishopsgate parish, has only been pulled down. It stood near the parish church and the line of City Wall, and was rebuilt in 1771. It was largely sixty years afterwards, and some cells were reconstructed. For about fifty years the watch-house has been occupied by a firm of tobacconists; it will be replaced with new business premises.

Solesmes Abbey.

RECENTLY it was announced that the French Government was unable to find a purchaser for the abbey, had decided to turn the building into a museum, but apparently the Fathers have heard nothing to that effect as yet, though the French Government might not have abandoned the idea. Certain a museum is a less objectionable fate for a splendid pile than sale to a possible vandal or to one who would demolish it. If it is already a *monument historique*, the Government would be well advised to make it so without delay.

THE BUILDING TRADE.

BOUR QUESTIONS AT THE BRITISH ASSOCIATION.

THE President of the Economic Science and Statistics Section of the British Association opened the proceedings by observing that the methods of speakers in this section differed from the methods of speakers on the political platform in that their object was to promote thought and not to lead people to action. So far as the addresses on labour questions were concerned we do not, however, know that they furnished any very definite matter for thought, and the President himself may have been aware of this, for he concluded the proceedings one day by saying "I am disagreed with the suggestion made in the course of debate that the employers should go to school with the professors, as he considered could be the other way about."

Professor S. J. Chapman, in discussing "the methods of industrial peace," summed up these methods as (1) arbitration by an impartial tribunal; (2) settlement by agreement of the parties through the mediation of persons appointed with the points in issue, i.e., conciliation; (3) the bringing of public opinion to bear. He considered conciliation to be the most hopeful method for conditions in this country, but intimated that in certain cases it might be supplemented by the third method. Conciliation we have always advocated, and in the last year considerable advance has been made in settling disputes by this method. In 1901 only twelve disputes affecting 6,479 workpeople were settled by conciliation, but in 1911 thirty-four disputes were thus arranged involving 163,668 workpeople, and in the intervening period between those dates the figures showed such a steady advance with the exception of the year 1908. We do not, however, agree that the invocation of public opinion is ever likely to facilitate conciliation. Public opinion is a jury that can rarely be appealed to calmly, and heated advocacy must be resorted to on both sides. Mr. Ramsay MacDonald referred to the question of conciliation and arbitration in connexion with the minimum wage, and he said he had come to the conclusion that the best means of establishing a minimum wage was by voluntary arrangements between employer and employed, and expressed himself opposed to compulsory arbitration. Under voluntary arrangements he said deposits could be given as security by both sides, but the only way that some employers would not enter into such arrangements, and by paying off wages undercut their rivals. He suggested that when such terms had been come to by the best employers they should be taken representative and applied to the whole industry.

It is this, however, lies the whole difficulty—such agreements can be enforced against employers; and it is somewhat curious that the solution moved at the Trade Unions Congress of 1911—rates of wages, the regulation of hours, and other conditions embodied in agreements between trade unions as representing the workers and the representatives of the employers in a given industry should be legally enforceable on all persons employing labour in that industry," was lost on a card vote by 42,000 to 484,000.

We referred to this question under the heading "Strikes—Collective Bargaining" (the *Builder* June 14), and pointed out the danger of creating federations of employers and workers which might only accentuate labour disputes. We may, however, point out that by conciliation many firms in one trade live at a fair rate of wages the danger from competition by "blackleg" employers is somewhat exaggerated. If the rate of wages be fair one and not a fancy rate the necessity of getting good workmen capable of competing in the market will soon compel all employers to offer that rate. The law of supply and demand, although it is nowadays much distorted, still exists, and inferior workmen on low pay cannot offer serious competition. To often the unions strive after a fancy rate of pay, and oppose any discrimination between good and bad workmen, and though

for a time certain firms may consent to pay fancy rates in order to complete existing contracts, the exigencies of trade prohibit this universal acceptance. The adoption of the principle of conciliation would, we feel convinced, produce standard rates of wages in different grades if it was only given a fair trial by both sides.

Sir C. Macara, who was unable to be present, wrote a letter, which was read, in which he stated that when perfect organisation exists on both sides disputes are settled usually without a stoppage of work, and he expressed the hope that an industrial federation might ultimately be formed on the lines adopted in Germany. The coal strike has shaken the premises on which this opinion is based. The coal trade is a highly organised industry, and yet the strike was one of the most prolonged experienced in this country. Sir C. Macara speaks with great authority, but we cannot agree with his opinion thus expressed. The more highly each side is organised the greater appears the risk of severe and prolonged struggles unless organisation means that greater authority be given to the leaders to control their followers. In the history of many of the strikes in this country the leaders who have started the strikes have proved incompetent to end them, and this has seriously affected any belief in collective bargaining which the unions used to claim as one of the great advantages attending trade unionism. One of the greatest drawbacks to successful conciliation has been the want of authority and lack of responsibility in the trade unions leaders. If the trade unions can control their own members the remarks we have made above on methods of securing fair terms by conciliation would apply with even greater force.

Space does not permit of our referring to all the subjects upon which addresses were delivered, but, having regard to the present tendency to advocate railway nationalisation, we may commend to the attention of our readers the paper read by M. Yves Guénot on the nationalisation of the Western Railway of France, which, he stated, was a complete failure.

L.C.C. SCHOOL OF BUILDING, BRIXTON, S.W.

THE London County Council, in erecting their School of Building at Ferndale-road, Brixton, had the object of improving the educational facilities for the building trade by establishing a separate special school devoted to one industry alone, so as to specialise and concentrate effort. Since it was established in 1904 the school has been steadily developing.

Four years ago a Day Technical School for Boys was established at the London County Council School of Building, having for its object the provision of a sound scientific and technical training for those preparing to enter the building trades and allied vocations, admission to the school being restricted to boys between thirteen and fifteen years of age. The curriculum includes history, geography, chemistry, physics, and mathematics, but these have a bias in the technical direction, for the history has special reference to industrial changes and the development of public and domestic architecture, the geography, the chemistry, and the physics have special reference to building materials, and the mathematics apply to the mechanics of building. The students have recently erected as part of their studies a small cottage situated in the large hall at the school, the architectural students preparing the working drawings therefor, and the artisan students constructing it.

The policy is to be extended in the forthcoming session, beginning September 23, by the establishment of a Senior Day Technical School to provide instruction for students whose age and previous education are above the age and standard of education required for admission to the Day Technical School for Boys. This senior school will prepare students for professional work, and the instruction is arranged in the following sections:—(1) General Building, (2) Architecture, (3) Surveying,

(4) Structural Engineering. The curriculum will include instruction in Building Construction, Architectural Drawing, Architectural History, Freehand and Perspective, Geometry, Land Surveying, Reinforced Concrete and Structural Engineering, Mathematics, Mechanics of Building, Chemistry and Physics of Building Materials, and practical training in Brickwork, Masonry, Carpentry and Joinery, Plumbing and Sanitary Engineering, Painting and Decorating. The course has been arranged to meet the requirements of three grades of students—(1) those able to take the complete course (fee, three guineas per term); (2) those able to take part-time instruction only (fee, one guinea and a half per term); (3) those desiring to take up work in individual subjects (fee, half a guinea per term). The part-time course provides instruction on five half-days per week from 3 to 5 p.m. in the following subjects:—Quantity Surveying, Land Surveying, Mathematics, Reinforced Concrete and Structural Engineering, Mechanics of Building. The full course will extend over two years. It is anticipated that many men professionally engaged who are unable or do not care to attend evening classes will avail themselves of this opportunity of taking up special subjects separately.

In the evening classes at the school this next session several improvements will also be effected. The work of the school has been divided into five sections, namely, (1) Trade Subjects, (2) Building Construction and Allied Subjects, (3) Surveying, (4) Structural Engineering, (5) Architecture and Drawing. The third and fourth sections are newly created this year. In accordance with recent legislative changes the school is up to date in devoting special attention to Valuation and the Law of Landlord and Tenant, Fixtures, Easements, Riparian Rights and Copyholds, the other work of the section including Building or Quantity Surveying, and Land Surveying. The Structural Engineering section is an interesting departure. The City and Guilds of London Institute recently promoted an examination in Structural Engineering, and the Concrete Institute has also decided to hold an examination therein. New building laws for reinforced concrete and steelwork have recently been imposed in London, and these are subjects to which the school is devoting attention, being equipped with testing appliances, machinery, tools, and apparatus for practical work. The course in Structural Engineering includes, in addition to steelwork, reinforced concrete and masonry structures, instruction in heavy timber-work, fire-resisting construction and fire prevention, and architectural acoustics. The lecturer for these subjects is Mr. H. Kempton Dyson, Secretary of the Concrete Institute, M.Inst.Assn. Testing Materials, etc., who is assisted by Mr. R. Graham Keavill, A.M.I.Mech.E., M.C.E., and Mr. A. E. Crabbe. Further particulars are obtainable from the Secretary of the London County Council School of Building, Ferndale-road, Brixton, S.W.

WAREHOUSE, WARRINGTON.

The warehouse of Messrs. Gartons, Ltd., seed merchants, of Warrington, which was burnt down at the end of April, has been rebuilt. The contract was let to Messrs. Joseph Dolan & Son, of Warrington, who carried out the work in accordance with the plans of Mr. Robert Garnett, architect. The building contains seven floors, each about 135 ft. long by 60 ft. wide. The site adjoins the River Mersey. An installation of automatic sprinklers is fed from the town main and by an auxiliary supply from a high-lift turbine pump, automatically started and driven by a 58-h.p. electric motor. There is a large number of chain hoists and goods and passenger lifts, all of which are driven electrically. The machinery for cleaning and grading the seeds is also operated by electricity, and electric power is obtained from the borough supply to the extent of about 500-h.p. Messrs. D. T. Brown, of Liverpool, supplied and fixed between 300 and 350 tons of steelwork in girders, stanchions, etc. The other sub-contractors engaged on the work were Messrs. Winstanley & Son; the Warrington Slate Company, Ltd.; Messrs. Roper & Co.; and Messrs. Waygood, Ltd.

A NEW HOPPER WINDOW VENTILATOR.

It is often necessary to use a hopper ventilator at a level so low that when not in actual use for ventilating purposes it is desirable to be able to remove the projecting parts of the hopper. To attain this end a very simple and effective apparatus has been devised and patented by Mr. William Sharpe, of St. Ann's Works, Southend-on-Sea. It consists of a metal frame carrying, at the top and bottom, pivots upon which turn the triangular wings of the hopper. To the inside of each wing is affixed a projection carrying a small quadrant against which the upper corners of the moving sash impinge in the act of closing, the result being that the wings are drawn round into a position flat against the sash. The latch at the top of the sash secures the whole. To open the hopper all that is needed is to pull down the latch at the top of the sash, which then opens in the ordinary way, carrying the wings into their open position in doing so. The sash has the great advantage of being without hinges, and it can be lifted out of place if desired for cleaning, painting, or reglazing; this involves no insecurity, as removal is only possible from the open position. The water joint at the bottom is also simple and does not involve the use of any of those drain holes which so often become choked with paint and dirt. The diagram will make clear the general arrangement.

The ventilator has been but a short time on the market, but has already been supplied in considerable numbers to the Essex Educational Committee.

GENERAL BUILDING NEWS.

CHURCH, PAIGNTON.

A new church, to be known as St. Paul's, has just been erected at Paignton. The new building is intended to serve as a temporary purpose. The floor surface of the building is 38 ft. long by 37 ft. wide, and will seat nearly 400 persons. Of its kind the building will occupy a unique position in the neighbourhood, its walls taking the form of panelled sheets of asbestos, while the roof is covered with slate and boarded inside. North and south aisles are provided, and the building is entered by a porch. The nave has a clearstory resting on arcade posts, and provision has been made for the chancel, organ chamber, and vestry. The church was built by Messrs. R. F. Yeo & Sons, from the designs of Mr. J. C. Beare. The cost of the new church and parochial room is over 1,800l.

CHURCH REBUILDING, WINTON.

Messrs. J. & W. Hayward, of Bournemouth, are the contractors for the rebuilding of the Congregational church, Wimbome-road, which is being constructed of brick and stone at a cost of 4,000l. The building will seat 650, and will be lighted by electricity and heated with hot air. The architect for the work is Mr. J. Donkin.

COUNTY SCHOOL, HYDE.

A new county school has been erected at Hyde for the Cheshire County Council. The building is set back from the roadway, and is approached by a circular carriage drive through a pair of wrought-iron gates with terra-cotta piers. The principal facade faces Clarendon-road. Messrs. Samuel Robinson & Sons carried out the work from the designs

of Mr. G. H. Willoughby, architect, Manchester.

THE CITY TEMPLE, HOLBORN-VIA-DUCT.

A new copper dome is being placed on the tower of the City Temple, and the stonework of the building is being restored. The work, which is being done by Mr. J. A. Hunt, of Highgate-hill, under the direction of Mr. Martin L. Saunders, A.R.I.B.A., has necessitated the erection of a great amount of scaffolding.

COUNCIL SCHOOL, WINCHESTER.

Mr. A. Heynes Johnson is the architect for this public elementary school, which has been erected at a cost of about 4,500l. The building provides accommodation for 300 scholars, and there are six classrooms, with central hall, cloakrooms, and teachers' rooms. The contract was carried out by Mr. S. Salter, of Southsea.

SCHOOL, ASHTON-UNDER-LYNE.

The new West-End Council School at Ashton-under-Lyne was opened recently. The school, which has been built on the Groby Hall site, will accommodate 1,200 scholars. The design of the new Council school is a modification of the corridor and verandah systems, in which the corridor is converted into a verandah during good weather and vice versa during inclement weather. The school has accommodation for 1,200 children in three blocks of buildings, and the total cost has been about 18,000l. The architect was Mr. Ernest Woodhouse, Manchester.

SECONDARY SCHOOL, HUNTLY.

Additions have been made to the Secondary School at Huntly. The new building will provide accommodation for about 200 pupils, and the estimated cost is between 5,000l. and 6,000l. The external walls are of granite, with freestone dressings, and the addition was designed to harmonise with the existing building. On the ground floor there are two classrooms for higher-grade subjects, two science laboratories, with the necessary storerooms, a library, and the requisite cloakroom and other accommodation. A well-lighted corridor connects the new with the existing building. The floor is laid with wooden blocks, while the entrance is tiled. On the first floor accommodation is provided for two classrooms and a room for instruction in art. The architects of the building were Messrs. Kelly & Nicol, Aberdeen, and the contractors were:—Mason work, Mr. John Mitchell, Huntly; carpenter, Mr. J. Pirie; slaters, Messrs. Milton & Son; plumber, Mr. J. Wilson; plasterer, Mr. Ballice Moir, Inverurie; heating, Messrs. McKenzie & Moncur, Edinburgh; asphalt, Messrs. Bannochie & Sons, Aberdeen; ironwork, Mr. Alexander Wilson, Huntly.

SECONDARY SCHOOL, HERFORD.

This school has been erected at a cost of about 10,250l. from the designs of Mr. Jack, the County Surveyor, and the contractors were Messrs. Wilkes & Son.

SCHOOL, LOFTUS.

A new school, provided by the North Riding Education Committee, has been erected just off West-road, Loftus. The new building has been erected at a cost of 3,400l., and has accommodation for 350 scholars. The main feature is the central or assembly hall, which is separate from the other rooms, access to it being obtained from a wide corridor, which runs the length of the school. There are seven classrooms, each capable of holding fifty children, off this corridor, as well as teachers' rooms, cloakrooms, and other rooms. The school has been built, says the *North Star*, to the designs of Mr. J. Bainbridge, the Inspector of Buildings under the County Council, and the chief contractor was Mr. T. Willoughby, of Northallerton.

TRAINING COLLEGE, DUNDEE.

The new training college for teachers being erected at a cost of about 60,000l., will afford accommodation for 400 students with all necessary classrooms, assembly lecture-rooms, gymnasium, and a practical school. The architect is Mr. T. J. Cappon, F.R.I.B.A., of Dundee.

COUNCIL SCHOOL, FELIXSTOWE.

Mr. J. Webb, Lic.R.I.B.A., is the architect for the new school which has been erected Langer-road at a cost of about 2,900l. Accommodation is provided for 200 children, the building contains an assembly hall, 4 by 22 ft., four classrooms, teachers' rooms, cloakrooms, etc. The building is of red brick with red Gunton dressings and tiled roof, the floors of the hall and classrooms are solid wood, while those of the cloakrooms and lavatories are of red tiles. The contractor for the work are Messrs. Parker Brothers, Felixstowe, and the clerk of the works Mr. C. A. Bennett.

MOORGATE-STREET IMPROVEMENT.

A new subway has been constructed at Moorgate-street connecting the stations at the underground railways which converge there. The subway is for passengers wishing to go from one station to another have been obliged to mount to the street level and cross Moorgate-street, which is usually in a crowded condition, and then descend again but the new subway will greatly facilitate the movement of the passengers. The length of the underground connexion is about 80 yds. and estimated cost of construction is 12,000l.

RESCUE STATION, DINAS.

The Rhondda Miners' Rescue Station has been erected at Dinas at a cost of about 7,000l. and is the largest station in Great Britain. The architects were Messrs. Teather & Wilson, F.R.I.B.A., of Cardiff, and the contractor was Messrs. Niblets & Son, Ltd., Messrs. Ellis & Ward, of Cardiff, carried the electrical installation, Messrs. Musgrave & Co., of Belfast, the heating, etc., and Messrs. Proger & Co., Cardiff, the hot water supply.

WORKMEN'S INSTITUTE, LLANBADRACH.

This institute has been erected from designs of Colonel E. M. Bruce Vaughan, F.R.I.B.A., of Cardiff, and the cost is 5,000l. The building contains library, reading-room, billiard-room, retiring-room, and a large hall which will seat 900. The contractor for the work is Mr. Richard Jones of Caerphilly.

NEW BUILDINGS IN LONDON.

Church Schools, Walthamstow. N. Mr. F. G. Farnham, architect, 17, Oldbrook-road, Ilford. Cinema theatre, Clerwell, E.C.; Mr. F. Danby Smith, architect, Parliament-mansions, Orchard-st. S.W. Parish hall for St. John's, Peckham; Mr. A. C. Long, Avenue-road, Deptford. Albert Dairy, E.C. P.L.A.: Messrs. Shellabear & Son, build 1, Mutley Plain, Plymouth. Extensions Main Dock, Royal Albert Docks, E. P.L.A.: Messrs. Topham, Jones, & Rail contractors, George-street, Westminster. Rebuilding premises, Hanover-street, Regent-st. W. Mr. C. Kearsley, builder, Marlborough-street, W. Telephone exchange, Creed-place, East Greenwich, S.E.; E. Office of Works, Storey's-gate, Westminster S.W. Additional workhouse accommodation, Lambeth, S.E. (6,000l.); Mr. J. L. Goldspink, Clerk, Lambeth Guardians' Offices, Bridge-street, Kennington, S.E. Alterations to No. Loampit-vale, Lewisham, S.E., for Mr. W. Tucker, chemist, 1A, Loampit-vale; Mr. W. Kennard, builder, Lewisham Bridge, Catholic school and church hall; Mr. J. Gordon, architect, 5, Old Broad-street, W. Warehouses, etc., Seymour-place, N.; Messrs. Lovegrove & Papworth, architects, 374, street, E.C.

PEARL ASSURANCE COMPANY, HOLBORN.

The work of building the new head office of the Pearl Assurance Company is now active progress under the direction of Mr. H. Percy Monkton, F.R.I.B.A. Messrs. J. Brothers, Ltd., Islington, are the contractor the crane stabling has been erected by Messrs. Skelton & Co., of Catford; and Messrs. Moreland & Son, Ltd., are responsible for the steel construction. Early in 1914 is probable time of occupation.

DRILL HALL, BARRY.

The contract has been let to Messrs. D. Davies & Sons for the erection of a new drill hall at Barry, as joint headquarters for Territorial Forces, the tender being for 4, Messrs. Teather & Wilson, architects, Car with superintendent the work.

NEW BUILDING FOR THE SCOTTISH TEMPERANCE ASSURANCE COMPANY, GLASGOW.

The new offices of the Scottish Temperance Life Assurance Company, which have

oted at 109, St. Vincent-street, Glasgow, opened on the 9th inst. Mr. Frank Uphorn is the architect. The frontage of the building facing St. Vincent-street measures 10 ft. in height by 804 ft. in length. The ground story is faced with polished Peterhead granite, while the upper portion is built with warm-tinted stone from the Blackpasture quarry in Northumberland.

GOODS "CLEARING HOUSE."
It is stated that full details of the proposed clearing house in London for the purpose of collecting, sorting, and dispatching goods either by road or rail are to be considered by a conference of representatives of the leading railway companies, which is to be held in London at the end of this month. The scheme, which, it is said, will give employment to 1000 men, has been previously described in these columns.

BRIDGE, LUMLEY.
At a special meeting of the Chester-le-Street Urban District Council the Lumley Bridge Committee reported that at a joint meeting with the representatives of the Chester-le-Street Urban Council it was decided to recommend that the tender of Messrs. Brims & Company, Newcastle, amounting to 9,916*l.* for the building of the new bridge over the Wear at Chester-le-Street be accepted. The tenders, which were all in excess of the estimates, and the Engineer, Mr. D. Balfour, stated that this was due to the increase in the cost of material and labour during the last two years.

YACHT STORES, NORTHAM.
The new yacht stores at Northam for Messrs. J. G. Fay & Co. are now completed. They comprise about sixty separate lock-up compartments, all well lighted and ventilated, the building, which consists of three stories, over 200 ft. long, is erected of brick with proof floors, steel windows, and sliding doors, with outside galleries for access to the several stores. The work has been carried out by Messrs. Playfair & Toole, contractors, under the supervision of the architect, Mr. Walter Wheeler, A.R.I.B.A., of Southampton.

PICTURE PALACE, LEIGH.
A picture palace is about to be erected at Leigh, Lancashire, in a central position, to accommodate about a thousand people. Building operations will proceed at once. Messrs. C. Prestwich & Sons, of Leigh, are the architects.

TRADE NEWS.
Under the direction of Mr. Herbert W. Watney, architect, Coventry, Boyle's latest patent "air-pump" ventilators have been applied to Bablake Schools, Coventry. Mr. Messrs. E. H. Shortland & Brother, Ltd., of Wolverhampton, Manchester, have just supplied one of their warm-air ventilating patent Manchester grates to Llanyre Hall, Llanidno Wells.

The Titan Lift Company, Ltd., 18, Red Lion-square, London, C., are supplying to Messrs. Atkinson & Co., Ltd., of W.C. premises at 9-11, Eagle-street, Holborn, W.C. the premises have been installed with a Titan electric lift.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

AIRDRIE.—Reconstruction of tuberculosis hospital; Mr. H. Inglis, Surveyor, Burghall, Airdrie.
AINES. N.B.—Additions to Bridgend Schools (5,000*l.*); Messrs. E. J. McBeth & Co., architects, Queen's House, Inverness.
ALTRINCHAM.—Fifty-six houses (11,000*l.*); Mr. E. Brown, Surveyor, Urban District Office, Altrincham.
ASPALL.—Six houses, Cole-lane, for the Wigan Steel and Iron Company, Ltd., Kirkless Hall, Wigan.
AXMINSTER.—Drill hall; Messrs. Ellis Son, & Co., architects, Bedford-circus, Exeter.
AXMINSTER.—Business premises; Mr. W. McClelland, architect, 10, Cathcart-street, Axminster.
AXMINSTER.—Auchterlouch (3,000*l.*); Mr. W. Cowie, architect, Alloway-chambers, Axminster.
BALEFEST.—Alhambra Theatre (5,000*l.*); Mr. J. Moore, architect, 55, Royal-avenue, Belfast.
BALLHAVEN.—Parish hall; Mr. G. Cunningham, builder, Victoria-street, Dunbar.
BESWICK.—Premises, Phillips Park-road, for the Co-operative Society.
BISHOPSCOMPTON.—Rebuilding Londonderry public-house, Page-street, for Messrs. Vaux & Sons, Ltd., Castle Brewery, Harley-street, Sunderland.

BOSCOMBSWELL.—Enlargement of United Methodist church and Sunday-school; the Trustees.
BRIGHOUSE.—Baths; Messrs. Lister, Brook, & Co., builders, 49, Commercial-street, Brighouse.
BUCKSBURN.—Enlargement of two schools; Architect to the Newhills School Board.

CAUMARTHONSHIRE. Schools, Nantygrog, and extensions to school, Whitland; Mr. W. V. Morgan, Architect, County Offices, Carmarthen.

CHALVEY.—Schools; Mr. C. H. Riley, Architect, Education Office, Aylesbury.
COLCHESTER.—Construction of military aviation centre; H.M. War Office, Whitehall, S.W.
COLLEYWESTON (near Stamford).—Residence; Mr. H. J. Venning, architect, 5, Bedford-row, W.C.
MESSRS. THOMAS & EDGE, BUILDERS, 73, NEW-ROAD, WOOLWICH, S.E.

COMBE MARTIN (North Devon).—Jam factory; Mr. J. C. Southcombe, architect, Bridge-buildings, Barnstaple.

DEWABURY.—School (200 places); Governors of the Dewsbury Endowed Schools Foundation; architect to be appointed by competition.

DONCASTER.—Proposed works for Messrs. Craven & Speeding Brothers, colliery wire rope manufacturers, Monkwearmouth, Sunderland.

DUNDEE.—Alterations to premises, Burnside-street, for the Dundee and District Coal Supply Association, Ltd., 13, South Union-street, Dundee.

EASTINGTON.—Proposed two receiving homes; Mr. J. M. Longden, Clerk, Guardians' Offices, Eastington.

EDINBURGH.—Additions to Broughton Soap-works for Messrs. Taylor & Co. (5,000*l.*); Mr. G. Craig, architect, 85, Duke-street, Leith.

ELGIN.—Picture-drome (3,000*l.*); Mr. R. B. Park, architect, 110, High-street, Elgin.

FRASHER. (Worcester).—School (1,900*l.*); Messrs. Espley & Co., builders, 77, High-street, Evesham.

EXETER.—Children's homes (6,360*l.*); Mr. R. M. Challinor, architect, 14, Bedford-circus, Exeter; Messrs. Soper & Ayres, builders, Exeter.

GELLINGHAM.—Erection of Hart Inn (2,888*l.*); Mr. S. Williams, architect, Wharton-street, Cardiff; Mr. F. J. F. Howells, builder, Cardiff.

GORSINON.—Garden village (400 houses, 66,992*l.*); Mr. Bodley Rees, architect, Cardiff.

GRANHAM.—Alterations and additions to premises, Wharf-road, for Messrs. C. W. Dixon & Co., furnisiers.

HARWICH.—Police-station; Mr. F. Whitmore, architect, Duke-street, Chelmsford.

HOCKBRIDGE.—House and garage; Mr. J. D. Coleridge, architect, 14, North Audley-street, W. Huddersfield.—Buildings, Salendine Nook, for the Co-operative Society.

HULL.—Gymnasium, Park Grove; Messrs. Lowther & Rigby, 22, Market-street, Manchester.

HYDE.—Public hall, police-court, offices, etc. Corporation-street (14,175*l.*); Messrs. S. Robinson & Sons, builders, Hyde.

INVERURIE (Aberdeenshire).—Extensions to auction mart; Mr. George Mare, Methlick, Aberdeen.

JARROW.—Catholic school; Mr. E. Walker, architect, Jesmond High-terrace, Newcastle; Mr. T. Lumsden, builder, 84, Albert-road, Jarrow.

KINLOSS.—Additions to school; Mr. C. C. Doig, architect, High-street, Forres.

KIRKCONNEL.—School (3,100*l.*); Mr. W. F. Crombie, architect, Union-chambers, High-street, Dumfries.

KIRKHAM.—Cottage homes (10,000*l.*); Mr. F. H. Brown, Clerk, Fyde Guardians' Offices, Kirkham.

LANGSIDE (Glasgow).—Baths, Calder-street (25,000*l.*); Mr. A. B. McDonald, Surveyor, Burgh Hall, Glasgow.

LARNE.—Alterations to premises, Bridge-street, for Messrs. McMeekin & Co., tea merchants.

LAW. N.B.—Drill hall (2,000*l.*); Messrs. Traill & Stewart, architects, 33, High-street, Lanark.

LEEK.—Proposed housing scheme; Mr. W. E. Beascham, Surveyor, Urban District Council Office, Leek.

LEICESTER.—School; Mr. W. G. Fowler, Architect, Education Office, Bowling Green-street, Leicester.

LIVERPOOL.—Alterations at St. George's Hall (2,557*l.*); Messrs. W. Tomkinson & Sons, builders, 33, Wellington-street, Toxteth Park, Liverpool.

LIVERSEDGE.—Offices, Queen-street, Marsh, for Messrs. Smith & Co.

LLANDILO.—Stores for the Farmers' Co-operative Society, Ltd. (1,348*l.*); Messrs. G. & J. H. Morgan, architects, 24, King-street, Carmarthen; Messrs. C. Thomas & Co., builders, Llandilo.

LONDONDERRY.—Picture theatre (2,500*l.*); Mr. J. Johnston, The Diamond, Londonderry.

LUTON.—Additions to premises, High Town-road, for the Luton Industrial Co-operative Society; Institute, Dallow-road, for the Davis

Gas Stove Company, Ltd., 4, Victoria-arcade, Deansgate, Manchester.

LYMINGTON (Hants).—Council offices; Messrs. Vincent & Smith, architects, Prudential-buildings, Above Bar-street, Southampton.

MAIDSTONE.—Workshops, Week-street, for Messrs. Jacobs & Sons, fancy goods importers. Printing works, etc., Barker-road, for Messrs. G. Foster, Clark, & Co., Ltd.

MARGATE.—School; Mr. F. J. Cornford, Town Hall-place, Westgate-on-Sea.

MARTINO (Dublin).—Proposed housing scheme (50,000*l.*); Mr. C. J. McCarthy, Architect, Town Hall, Dublin.

MIDDLESBROUGH.—Machine bakery for the Middlesbrough Co-operative Society, Ltd. (1,503*l.*); Mr. W. E. Haslock, architect, 11, Albert-road, Middlesbrough; Mr. M. France, builder, 3, Balmoral-terrace, Redcar.

MOLD.—Proposed 320 houses; Mr. W. R. Rowdon, Surveyor, Urban District Council Offices, Mold.

NAINA.—School (2,500*l.*); Mr. P. M. Cram, architect, 6, Albert street, Nainai.

NEATH.—Drill hall; Mr. Mansel H. Hunter, architect, Neath.

NELSON.—Workmen's dwellings; Mr. B. Ball, Surveyor, Town Hall, Nelson.

NEWBRIDGE (Mon.).—Institute; Mr. J. W. Aldis, architect, Victoria-place, Newbridge.

NEWCASTLE-ON-TYNE.—Picture hall, Biddlestone-road; Messrs. White & Stephenson, architects, Pilgrim-street, Newcastle.

NORTHFLEET.—Additions to works for Henley's Telegraph Works, Ltd.

NORTH SKELTON (Yorks).—Drill hall (2,000*l.*); Mr. W. Wardman, architect, 105, High-street, Redcar.

NORTHWICH.—Baths (7,860*l.*); Mr. T. Astles, builder, Northwich.

NOTTINGHAM.—Proposed refreshment house (550*l.*); Mr. F. B. Lewis, Architect, Town Hall, Nottingham.

PAISLEY.—Alterations to Glenfield Starch works for Messrs. Watherspoon, Ltd.

PARTICK.—Ten houses, Park-drive (5,000*l.*), for the Scotsdown Estate Building Company.

PONTYPRIDD.—Block of shops, Penrhosceiber, and twenty-nine houses at Thomastown; Mr. P. I. Jones, architect, Church-street, Pontypridd.

SEVEN SISTERS (Neath).—School; Messrs. W. & J. R. Watson, Ltd., builders, Neath.

SHEFFIELD.—Fifty-three houses and two houses and shops, High Winobank Estate (9,347*l.*); Mr. A. Waddington, builder, 85, Empire-road, Sheffield.

SHIELDHALL.—Additions to buildings for the Scottish Co-operative Wholesale Society, Ltd.

SOUTHWRAM.—Additions at Brookfoot Mills for Messrs. Turner & Wainwright, manufacturing confectioners.

SOUTHPORT.—Structural alterations to premises, Lord-street, for Messrs. C. F. Chinnery, Ltd., furnisiers.

SOUTHWICK.—Offices at shipyard for Messrs. Swan, Hunter, & Wigham Richardson.

STOCKPORT.—Probable re-erection after fire of portion of works at Offerton for Messrs. W. Batterley & Co., hat manufacturers (damage 20,000*l.*).

SUNDERLAND.—Extensions to school, Thomas-street; Mr. J. M. Wright, builder, Sheepfolds, Sunderland.

TARRADALE (Muir of Ord).—School (3,500*l.*); Mr. T. Munro, architect, 62, Academy-street, Inverness.

THIRSK.—Town Hall; Mr. W. H. Brierley, architect, Lendal, Yorks; Mr. W. Birch, builder, Barbican-road, York.

TORQUAY.—School; Mr. P. Morris, architect, 1, Richmond-road, Exeter.

TROODYRHIW.—School (6,900*l.*); Mr. A. J. Colborne, builder, Swindon.

TWICKENHAM.—A plan has been passed for alterations to Brandon's Brewery, London-road, for Mr. W. Simmons. Plans have been lodged for a motor-garage in Gould-road by Messrs. Brewer, Smith, & Brewer; also for alterations to St. Margaret's Laundry, Crown-road, by Mr. G. L. Alexander.

WAKEFIELD.—Extensions to infirmary (4,000*l.*); Messrs. Simpson & Firth, architects, Southgate-chambers, 9, Southgate, Wakefield.

WESTON-SUPER-MARE.—Picture palace; Mr. T. Gilmore, architect, South-parade, Weston.

WHITWORTH.—School, Millgate (5,000*l.*); Mr. F. Little, architect, 15, Ribblesdale-place, Preston.

WIDNES.—Water tower (6,000*l.*); Mr. Isaac Carr, Water Engineer, Town Hall, Widnes.

WIGTON.—Extensions to works for Messrs. Carr, White, & Co., jam manufacturers.

WIVICK.—Additions to Lancashire County Asylum; Mr. Thomas Chadwick, architect, 16, Princess-street, Manchester.

WORKSOP.—Institute, John-street, for the Primitive Methodist Trustees.

YARMOUTH.—Additions at factory for Messrs. Grout & Co., silk crape manufacturers, St Nicholas-road, Yarmouth.

* See also our list of Competitions, Contracts, &c., on another page.

National Nautical School, Portishead : The Chapel.

Mr. Edward Gabriel, A.R.I.B.A., Architect.

NATIONAL NAUTICAL SCHOOL, PORTISHEAD.

THE chapel to this Institution has been erected from the designs of Mr. Edward Gabriel (Messrs. Edmeston & Gabriel), who also designed the school buildings.

The chapel is built of stone from the Hart-ham Park and Four Hill Quarries. It is cruciform in plan; the nave with narthex forms the main western arm, and the sanctuary the eastern arm; while there are transepts north and south, the chancel being at the crossing. A clergy vestry (with heating-chamber under) adjoins the north transept.

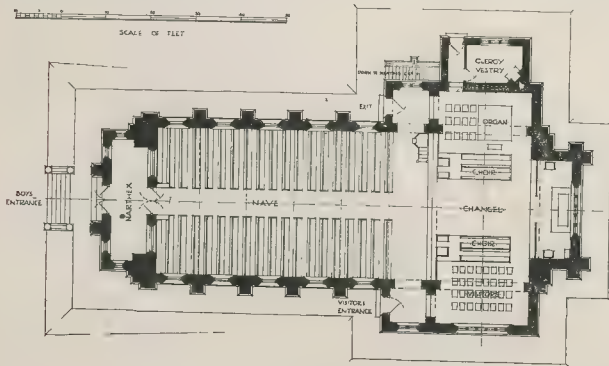

The nave and chancel form the main body, and, measuring 82 ft. long by 33 ft. wide, covered by one continuous roof reaching height of 50 ft. to the ridge. The roof is covered with Broseley tiles. The roof of the sanctuary is 5 ft. lower, and those of the north and south transepts are of the height of the nave side of the eaves of the main roof. The nave projects 10 ft. in front of the main west wall, and has a flat roof about 11 ft. high parapet above.

The nave is lighted from the sides by ten single-light windows with buttresses between, and from the west main wall, above the nave roof, by a large five-light transomed mullioned window. The transepts and the sanctuary have each a five-light transomed mullioned window.

Externally, the west window is set in the shadow of a large, arched recess and flanked by buttresses, the gable over being finished with an imposing bell-turret. The nave has a pedimented doorway with sculptured figures over.

A visitors' entrance is in the south transept and an emergency exit has been provided in the north transept. The western main hall has a stone screen internally, dividing the nave from the narthex, double swing-doors being the means of communication.

The stonework internally, with the exception of the sanctuary, is left exposed. The sanctuary walls are panelled out, as also is the nave vaulted ceiling. The sanctuary and transepts are divided from the main building by three-centred arches the full width of the openings.

National Nautical School, Portishead : The Chapel.

Mr. Edward Gabriel, A.R.I.B.A., Architect.

An open timber roof extends from the eastern main wall to the eastern main wall, the masses resting on moulded stone corbels between windows.

The floors of the nave and transepts are paved with wood blocks; those of the narthex and vestibules are paved with red tiles. The chancel steps and floor and the sanctuary steps and floor are all of marble.

The nave is fitted with fixed oak seating of simple design, accommodating 350 boys and floors. The choir is provided with seating of a more elaborate design in Austrian oak on the side of the chancel and facing north and south. Accommodation for visitors is provided in the south transept, with a separate entrance. The north transept will contain the organ.

Two handsome reading-desks with carved canopies are provided for the Chaplain and Captain Superintendent respectively on either side of the chancel, and form part of a screen, which it is intended to erect later on.

The pulpit, designed in harmony, is on the north side, with provision for a lectern on the north side.

Looking towards the sanctuary, the rich velvet dossal, executed by Messrs. Watts & Co., forms a fine background to the beautiful carved oak communion-table, the latter being a gift of the Captain Superintendent in memory of his son, the late Captain Egerton Still.

The traditions of the old training-ship, H.M.S. *Formidable*, have not been forgotten, and some of the old ship's oak has been incorporated in the new fittings.

The general contractors for the building and the seating were Messrs. Samuel Marten & Co., Bristol; and the chancel fittings, pulpit, communion-table, and reading-desks were executed by Mr. F. B. Bell, of College Green, Bristol, from Mr. Gabriel's designs.

The following sub-contractors were employed:—Marble work, the Art Pavements and Decorations, Ltd.; wood block flooring, the Acme Wood Block Flooring Company; tone panelling, Messrs. Gilbert Seale & Son; all Messrs. Llewellyn & James, Bristol; bronze communion railing, Messrs. Spital & Clark; gates and fencing, Messrs. Priest & Son, Bristol; seating apparatus, Messrs. J. Jeffreys & Co.; glazing, Messrs. J. Hall & Sons; sculpture, Mr. Wm. Smith; electric light and fittings, Messrs. Buchanan & Curwen, Bristol.

MANCROFT TOWERS, OULTON BROAD.

MANCROFT TOWERS, the residence of Colonel Philip E. Back, stands in a commanding position on an eminence overlooking Oulton Broad and the Waveney Valley, whence

Mancroft Towers, Oulton Broad.
Mr. George J. Skipper, F.R.I.B.A., Architect.

views many miles in extent can be obtained across the surrounding country. The building has been designed according to instructions in a simple and plain manner, after the style of Tudor brickwork, of which there are many good examples in East Anglia. No stone has been used for decorative purposes; the mullioned windows and all other features have been carried out entirely in brick. The interior has some interesting features, of which the hall on the ground floor, carried up higher than the rest of the ground-floor rooms, and the long gallery on the first floor extending the entire length of the building are examples. An electric plant has been put down for the purpose of supplying the building with water and the whole of the establishment with electric light. A lodge designed in the same style adjoins the entrance gate. Messrs. J. Youngs & Son, of Norwich, were the general contractors, and the architect was Mr. George J. Skipper, F.R.I.B.A., of Norwich, with whom at the time Mr. F. W. Skipper was in partnership.

MIDDLE TEMPLE HALL, E.C.

CONSIDERABLE alterations are being carried out at this building under the direction of Sir Aston Webb, R.A., and Mr. H. J. Wadling, the Architect and Surveyor to the Middle Temple.

The floor of the hall is constructed with binders of oak and chestnut 16 in. square in

section, which are carried by the north and south walls and were also supported by a central wall in the basement running east and west. These binders had in several instances become unsound where the ends were buried in the walls and had been supported by timber posts against the walls. The spaces between the binders have fir joists, several of which had decayed.

The basement under the hall was devoted to cellars, rooms for various purposes, and lavatories, etc., divided by brick walls, and these cellars and rooms were vaulted in brick.

The whole of the old basement interior has been cleared away and new walls have been erected to form barristers' robing-room and lavatories, heating chamber, wine and beer cellars, strong-rooms, and sundry domestic offices. A central corridor has been built running east and west and giving access to these various rooms. By the construction of false ceilings space has been obtained above for air-ducts conveying warmed air from the heating chamber to the hall floor above.

Brick piers have been built to support the floor binders, and they have been otherwise strengthened with fitch plates.

The formation of the central corridor above referred to has involved an alteration of the east elevation in Middle Temple-lane and the formation of a new doorway and new windows. In doing this the detail of the old work is strictly followed.

The new corridor also involved the cutting of a large opening in the main east wall of the hall and the insertion of large steel

Mancroft Towers, Oulton Broad.
Mr. George J. Skipper, F.R.I.B.A., Architect.

stanchions and girders with a grillage foundation under; as the old work shows traces of several settlements, this was a work involving considerable difficulties, which have been successfully surmounted.

The fine old screen at the east end of the Great Hall had shown considerable settlement. This work has been strengthened and pinned up.

In consequence of the settlements in the main east wall the architect deemed it desirable to underpin the wall on each side of the new opening described above, and in the excavation for this underpinning a number of blocks of sandstone were found (imbedded in the clay), which had formed part of some Norman building. These are now in the office of the clerk of works.

Entirely new lavatories, sanitary fittings, sinks, ranges, etc., are provided, and electric light has been installed.

The general contractors are Messrs. George Trollope & Sons and Colls & Sons, Ltd. The sanitary work is by Messrs. Dent & Hellyer, the kitchen work by Mr. J. Edwards; the electric light by Messrs. Strod. The clerk of works is Mr. Horser, who is Clerk of Works to the Middle Temple.

LEGAL COLUMN.

London Building Act: Dangerous Structures.

THE case London County Council v. Jones, reported in the *Law Reports* for August, raised one or two interesting points under the London Building Act, 1894.

Summonses were taken out under sect. 106 of the Act in respect of two houses in Queensland-road, Islington, alleging the structures to be in a dangerous state and requiring the owner to execute certain work thereon. Notices had been given to the owner, and, as no work had been carried out, the County Council had caused the said buildings to be shored up.

The defendants contended that the premises were not in a dangerous state, because there was no danger to persons in them, as they were uninhabited, neither was there danger to the public, since there was a garden space between the houses and the public pavement. It was also contended that, even if they had been in a dangerous state they had ceased to be so at the time the summonses were issued, because the Council had then shored them up.

The magistrate found that the premises were not dangerous, but the Council appealed. The judges of the Divisional Court reversed this finding, sending the case down again to the magistrate. It is hardly necessary to say that neither in the Court below nor in the Divisional Court was any importance attached to the contention that the houses were not dangerous because they had been temporarily shored up by the Council; that would be an absurdity, and render the Act nugatory.

The magistrate, although the houses were ruinous, had found them not to be in a dangerous state because there was no danger to any inhabitant nor to any of the public lawfully near them; but the judges of the Divisional Court held that in the case of houses in a row such as these this view could not be maintained, as there might be danger to the persons in adjoining houses or to the adjoining houses. There is one feature in the case which is somewhat curious. It appeared that in December, 1910, proceedings had been taken under sect. 115, which relates to dilapidated and dangerous buildings, and that the owner of the houses had then carried out certain work upon the houses to the satisfaction of the Council. Those proceedings were held not to be a bar to the present summonses under sect. 106.

The Lord Chief Justice pointed out that, first, there was a distinction between dilapidated houses and houses dangerous, and, secondly, that under sect. 107, if the owner desired to question the requisition made upon him under sect. 106, he should have applied for arbitration. In such an arbitration, no doubt, the question could have been raised as to whether what had been done in 1910 was adequate, and whether, in fact, the houses were dangerous, whereas in the absence of objection by the owner the only question was as above stated, whether danger to some occupier or to the public was necessary to support the summonses.

Sect. 115 relates to structures unfit for habitation or in a structural condition prejudicial to the property or inhabitants of the neighbourhood, whereas sect. 106 only relates to their dangerous condition.

The Light Railways Act.

IN the case of Rex v. Barton and Immington Light Railway (current *Law Reports*) a point of procedure has been settled under the Light Railways Act, 1896, which is by no means clear from the statutes relating to the subject. The Lands Clauses Consolidation Act, 1845, by sect. 121, provides certain procedure where lands are being acquired and the interest of persons having no greater interest than tenancies by the year or from year to year are affected. The Light Railways Act, by sect. 13, varies this procedure, substituting a single arbitrator, or, in the absence of agreement by the parties, the Board of Trade as the tribunal, which shall determine the amount of compensation, and, subject, 3 enacts that the Arbitration Act, 1889, shall apply to arbitrations under this section. In the case in question the Light Railway order incorporated the Lands Clauses Act, and the above procedure was adopted, a single arbitrator being appointed under sect. 13 of the Light Railways Act; but the Light Railway Company refused to take up the award when delivered by the arbitrator under sect. 35 of the Lands Clauses Act on the ground that as by subsect. 3 the Arbitration Act was applied and the procedure for enforcing awards under that Act was applicable. The Court held that the provisions of the Light Railways Act only extended to the method of assessing compensation, not to the methods of enforcing awards, and a mandamus would issue to compel the promoters to take up the award, that being the procedure under the Lands Clauses Act.

LONDON COUNCILS.

Bermondsey.—The Borough Surveyor has been instructed to get out plans and estimate for the erection of a convenience at the entrance to the Joiner-street arch. In connexion with the extension of the tramways in Tooley-street it has been decided to repave the roadway from the present terminus, westwards, with wood, and, if prices can be arranged, the County Council's tramway contractors (Messrs. Dick, Kerr, & Co.) are to undertake the work. The following plans have been passed:—Messrs. G. H. Walgrove & Co., 6, Willow House, Willow-street, Bermondsey, buildings, Jamaica-road, for Mr. J. Harradine, 45, Grosvenor-road, Wallington; Messrs. J. Greenwood, Ltd., 12-14, Arthur-street West, London Bridge, S.E., warehouse, Bermondsey-street, for Messrs. M. Welch & Co., 15-30, Moor-lane, E.C.; Messrs. J. E. Whiter & Co., 89, Newington-butt, S.E., factory, St. Helena-road; Messrs. William Moss & Sons, Ltd., Queen's-road, Loughborough, S.E., sugar warehouse, near Drummond-road, for Messrs. Peck, Frank & Co., Ltd.; Messrs. J. Garlick (1910), Ltd., 23, Sloane-street, S.W., girls' club, Jamaica-road; Mr. W. G. Wells, jun., 49, Brunel-road, Bermondsey; houses in Clarence-street for Messrs. E. Wells & Son, Ltd., Oak Cottages, Clarence-street, Bermondsey.

Bethnal Green.—The question of the establishment of a public library has been referred to the General Purposes Committee for consideration and report.

Hemel Hempstead.—A plan submitted by Mr. E. Darer for the erection of a cinematograph hall at Marlowes has been approved.

Hendon.—Plans have been passed by the Rural District Council for Mr. W. H. Pettit for the erection of five houses in Surrey-road, Pinner.

Heston and Isleworth.—At the last meeting of the Urban District Council the Building Sub-Committee were instructed to proceed with the preparation of plans for the construction of a school to accommodate 800 children in Alexandra-road.

Kingston.—The Guardians have accepted the tender of Messrs. Jarman & Co., Richmond, at £800, for carrying out repair works at the infirmary. At the last meeting of the Board the Chairman of the Building Committee presented a Report on the result of the dispute between Messrs. Weibking and the Board. In August, 1910, the Guardians entered into a contract with Messrs. Weibking for certain additions and alterations to the buildings at Norbiton Common Farm for the sum of £554. From time to time various sums were paid in respect of the work amounting to £500, and, according to the measurements of the

Board's Architect the final sum due to contractors was £20, 2s. 1d., against a claim made by the firm of £234, 2s. 3d. After much correspondence the Architect measured the whole of the work again, and would not at his decision. The contractors subsequently wrote offering to accept a sum of £200, settlement of the dispute, which the Guardians refused. At the request of the contractors matter was referred to arbitration, and Guardians appointed a Mr. Stonor to represent them. This gentleman measured up the whole of the work and agreed entirely with the figures of the Board's Architect. As the surveyor appointed by Messrs. Weibking would not agree with him, the matter was referred to an independent arbitrator pointed by the two professional gentlemen representing the contractors and the Board. The umpire eventually made his award, which was taken up by Messrs. Weibking. The amount of the award was £175. This included the fees of Mr. Stonor, the surveyor, for the builders, and the umpire's costs.

Malden and Coombe.—A plan submitted by the Surveyor for the construction of a new road, to be known as Coombe-hill-road, has been approved, subject to certain conditions. The tender of the Strand Building Company has been accepted, at £91, for carrying out extensions at the Mortuary.

Richmond.—At the last meeting of the Town Council a resolution to the effect "that the Council consider that a *prima facie* case has been made out for the treatment of tuberculosis, to be carried out in the borough of the Town Council," was approved. Plans have been passed for Messrs. Brewer Smith, Brewer for alterations to the "Bungalow" Manor-road, and for the erection of a house in North-road, also for Mr. R. L. Pearce, the erection of three shops in George-street.

St. Pancras.—The Borough Council has granted the application of Mr. James C. Michael, 331, Trinity-road, Wandsworth, S.W., to construct vaults at Messrs. Voile & Worle factory in Bidborough-street.

Stoke Newington.—Electricity mains are to be extended at an estimated cost of 1901. The tender of Messrs. William Griffiths & Co. Ltd., has been accepted for wood-paving portion of Brownswood-road.

Watford.—The Clerk to the Guardians has been instructed to write to the Watford Urban District Council, asking them if they will consider the question of erecting suitable women's dwellings in the town. The Rural District Council have received sanction from the Local Government Board to borrow £75 for making up Shire-lane, Chorleywood.

West Ham.—The Education Committee have received a letter from the Managers of St. Francis School, Stratford, announcing their intention to enlarge the school. No objection is to be raised. It has been decided to install hot-water heating apparatus in lieu of present hot-air plant at the Holbrook-road School, at an estimated cost of £51. Plans prepared by the Architect for the enlargement of the handicraft centre at St. Harold-road School have been approved. The estimated cost is put at £500. Various alterations are to be carried out at the Union Girls' School at an estimated cost of £92.

OBITUARY.

Mr. G. Hay, R.S.A.

THE death, on August 31, in Edinburgh, of Mr. George Hay, aged eight one years. Mr. Hay, until lately Secretary of the Royal Scottish Academy, was a native of Edinburgh, and began his career as an architect, but after some years devoted himself to painting. In 1869 he was elected an Associate, and in 1876 a Member, of the Royal Scottish Academy, of which he was Secretary, November, 1881–January, 1907. He was chiefly distinguished for his pictures of subjects taken from Sir Walter Scott's novels.

Mr. A. Marks.

THE death, on September 1, at Deal, of Mr. Alfred Marks, aged seven years. Mr. Marks, a brother of H. St. Marks, R.A., was formerly London Manager of London City and Midland Bank; he retired from business some years ago. Mr. Marks was distinguished for his researches in the field of archaeological and topographical history, in respect of which, and particularly as regards London, he was a frequent contributor to the columns of the *Athenaeum*, *Notes and Queries*, and other journals. For years ago he brought out the standard work upon the chronicles of Tyburn and the gallows, and with Mr. Herbert Sieveking, succeeded in determining the precise site, and period of the permanent gallows there; as founder of the Society for Photographic

(Continued on page 312.)

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xviii.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

OBITUARY—continued from page 340.

ing Relics of Old London he published, from twenty-five to thirty years ago, a valuable collection of views, and compiled the letter-press descriptive of each series; he was also much interested in the arts, and was the author of a book upon the life and work of Leonardo da Vinci, and of "Hubert and John Van Eyck: The Question of Their Collaboration Considered." He was latterly engaged upon the preparation of histories of sanctuaries and of the Chiltern Hills, but was unfortunately disabled by a paralytic seizure when he was in Algiers in the spring of last year. Mr. Marks leaves a widow, formerly Miss Hoppus, the authoress, and (by his first marriage) four children; of his two sons one is an artist, who resides in Paris, and the other an engineer.

Mr. G. Wilson.

Mr. George Wilson, architect of Messrs. Sydney Mitchell & Wilson, Young-street, Edinburgh, died on the 16th inst. at St. Andrews. He was long and honourably associated with the profession of architecture in Edinburgh, first in the capacity of assistant to Sir Rowand Anderson, and later as partner with Mr. Sydney Mitchell, with whom he co-operated in carrying out the numerous works undertaken by the firm. During the past few years he did not take an active part in business matters. Mr. Wilson was of a retiring disposition, and took practically no part whatever in public life in the city. He

was highly esteemed among his professional brethren.—*Scotsman.*

Mr. E. F. Jacob, C.I.E., A.M.Inst.C.E.

Mr. Edward Fountaine Jacob died, aged fifty-nine, on September 1, at Exmouth. He entered the Public Works Department of India in 1876, and retired five years ago; he was latterly manager of the Oude and Rohil-Kund Railway, and was made a C.I.E. in 1893.

Mr. G. B. Witts, C.E.

Mr. George Backhouse Witts, who died, aged sixty-six, on September 6, at Leckhampton, Banbury Railway, and was also employed by the Government. As a leading member of the Bristol and Gloucestershire Archaeological Society he conducted many researches in the Cotswolds district, and was successful in exploring several barrows containing pre-Roman remains, many of which are preserved at Oxford.

Mr. H. J. Davis.

The death occurred, on September 5, of Mr. Henry John Davis, Chairman of the Diamond Foundry Company, Ltd., London, and who was in his seventy-first year, was one of the founders of the firm of Messrs. H. & C. Davis & Co., Ltd., engineers and ironfounders, Mr. Harold N. and Mr. Cyril G. Davis, are connected with the latter business.

PATENTS.

IMPERIALISM AND ARCHITECTURE.

THE greatness of a civilisation declares itself in its architecture. Without the pyramids and colossi of the Egyptians, the temples and monuments of the Greeks, or the thermae, fora, and aqueducts of the Romans, ancient history would be to us mythical, legendary, and unreal. It is in the scattered remains of the architecture of these ancient peoples that we see them face to face, in their carvings that we feel their closest intimacy, and in their brick courses that we get the direct evidence of their strength. History teaches us that the endurance of a nation depends not so much upon its acquisitions of the arts of war as upon its accomplishments in the arts of peace. Once having conquered the world, Alexander the Great controlled it not by the marshalling of troops, but by the founding and establishing of cities of Greek design. Rome spread out her *castra* not as permanent military outposts, but as the precursors of her eternal *coloniae*. It is to the civilising influence of their cities that we must attribute the enduring greatness of Greece and Rome.

Colonies and dependencies may be acquired by conquest, but their retention demands a higher cultivation as well as a superior military strength. Power without the civilising influence of culture is ignorance ruling knowledge with a rod. A Roman poet wrote of Greece, "Captive Greece made captive her captor Rome"; and during the latter end of last century Germany, after an enforced isolation from her weaker but more artistic opponent France, lost immeasurably in art inspiration as the intangible price of her apparent success. If knowledge and culture have been the necessary accompaniments of successful imperialism in the past, they are its essentials to-day. Now we see not one imperial power but many, each eagerly pursuing its own policy of government throughout colonies, dependencies, and protectorates beyond the sea, vying with its neighbours in dispensing the benefits of civilisation, resenting interference, and jealous of established success. Great Britain, by reason of the wider extent of her realms, glories in responsibilities demanding pre-eminence not only in administrative ability, but also in the practice of the

arts. Incapacity in the latter is the precursor of weakness in the former. When Great Britain is incapable of setting an example of architectural achievement to her dependencies other nations more virile will slowly but surely take advantage of her relapse—step into the breach, undermine her prestige, and bring about an imperial disaffection more effectual in its consequences than the ravages of internal feuds.

Cosmopolitanism, that volatile medium which is so necessary to the fusion both of national and individual interests, is not antagonistic to imperialism. Imperial architecture is affected by cosmopolitanism, not in its parts, but as a whole.

Whilst within the confines of an empire there will ever exist climatic changes and racial differences, imperial character, adaptive, amenable, and elastic, will absorb and embrace these, remaining imperial and distinctive at the same time. The expression of imperial character through the medium of architecture is a policy which the Mother Country should encourage. Divergence from a course set by the parent which

is unattributable to the inherent demands of climate and location means imperial disintegration. Our rule and protection extends not only over aboriginal countries and continents which have gradually become immense colonisations, as in Australasia and Canada, but also over vast countries like India, whose native populations far outnumber the purely British section; or, again, it extends over countries like South Africa, original independent colonisations of settlers drafted from other European powers. If our imperialism is to be completely effective throughout the length and breadth of the Empire the Mother Country must see to it that her national character is expressed not only in the architecture of the cities she founds, but also in the public buildings of the cities she rules.

In Canada to-day there are but too evident tendencies to an appropriation of American ideals and methods of expression not entirely to be attributed to the natural influence of cosmopolitanism and opposed to imperialistic ideals. England as the hereditary exemplar is fast losing ground. The incompetence of the British missionary and the chaotic confusion of style in which our architecture has become entangled is largely responsible for this estrangement. In Vancouver, Toronto, and Montreal the largest and handsomest buildings are the works of American architects—McKim, Carrère & Hastings, and Burnham. England should take steps to recover this lost ground. In Australia the remoteness of any such civilising neighbours removes the danger of such an unnatural alliance; but even here we must remember that the eyes of the Australian are, by the spread of literature and the illuminations of the photographer, open to the architecture of the world. In South Africa, without interfering with the natural expression of imperialistic ideals, the homestead of the original Dutch settler supplies the motive for the same type of building erected in modern times. It is somewhat regrettable, however, to find that these rustic characterisations have been allowed to penetrate the more important monuments of the towns. Even so, whilst it may savour of presumption to enforce an imperial architecture upon countries like India, possessed of glorious native traditions, at the same time to attempt to emulate the native craftsman by a process of transmutation through British eyes would be as foolish as it would be weak. The recent erection of public buildings in Bombay in a pseudo-Indian-cum-English style is a distinctly retrograde step.

The confusion consequent on the attempt to combine the characteristics of a modern European and Indian building in one and the same structure, to erect for the native that which by tradition he alone is capable of erecting for himself, is to invite not only the scorn of the Imperialist, but also the ridicule of those whose own noble architecture has been so grossly caricatured. As a compliment in political diplomacy it is shallow, and from every point of view a grave error.

The Oriental is to-day interested and concerned in emulating the civilisation of the Western world. Our

architectural schools are training students from India, China, and Japan. Indian rajahs vie with one another in building houses based on English models. If we are to retain suzerainty in India this attitude is one to be encouraged. Before the Mutiny palatial residences and public buildings were erected in accordance with the understood traditions of the protectorate power. With the characteristic assurance and confidence enjoyed by our predecessors of the period we unhesitatingly expressed ourselves in our natural and straightforward way. This was not to be interpreted as showing any lack of appreciation of the glories of the Mogul Empire; it showed no disrespect for the unapproachable delicacy of the minarets and domes of the Taj Mahal, no disregard for the beauty of the coniferous spires of the city of Benares, no antipathy to the palaces of Agra, or distaste for the earlier rock-cut tombs. Indeed, such an attitude is one of submission, veneration, and respect; a conscious recognition that these things are the unattainable remains of a glorious past.

An empire can nurse no finer ideal than the cohesion of its dominions in cities erected in one style of architecture recognised throughout the world as the expression of its own imperial ideals. The encouragement of such an empire pervading style throughout colonies, dependencies, and protectorates will tend to annihilate distance and conduce to an imperial liberty, equality, and fraternity. Out of political it will create personal ties, and into closer relation will bring the ambitions of those whose destiny it is to excel.

ST. GEORGE'S HALL, LIVERPOOL.

HERE is to be made a last determined effort to save Elmes's masterpiece from partial stultification. A number of the more influential citizens and the Architectural Society of Liverpool have taken the extreme step of securing the services of Mr. Rigby Swift, M.P., to appear on their behalf at the Local Government Board inquiry, which must necessarily be held upon the Corporation's application for the loan of 2,500*l*. The money is required to pay for the mutilation of the podium and the introduction of a flight of steps, with three shallow landings, as an accompaniment to the proposed equestrian statue of King Edward—a statue that will, if erected, have the misfortune to balance an unoccupied pedestal, until some personage of sufficient merit can be discovered to share the honours of commemoration with his late Majesty.

We shall not weary our readers with a detailed recital of the history in all its lamentable phases of this attempt to make the erection of a memorial to King Edward an excuse for a costly alteration of a perfect building. The salient points must be familiar to all—the initiation of the idea by Sir Goscombe John; the advisory committee of experts with a majority of one in favour of its execution; the disagreement of Sir Aston Webb and Professor Blomfield with the decision; the national and world-wide

support which their attitude at once evoked in architectural circles, materialising in a storm of protest against threatened desecration; protests from Royal Academicians, from the Council of the Royal Institute of British Architects, from Presidents of provincial architectural societies, from the architect members of the French Académie des Beaux-Arts, and from the leading American architects; and the disregard of all this, and of the strongest local feeling by the Corporation Committee, who felt that their dignity was being impaired, and, therefore, proceeded to propose alterations of their own by way of demonstrating their confidence in themselves. It was nothing to them that the available and published evidence of Elmes's and Cockerell's actual intention show that both architects, after various experiments on paper and in practice arrived at the same conclusion—the conclusion embodied in the existing treatment of the south elevation. The Corporation authorities have indeed displayed remarkable ingenuity in refusing to face that fact; they have consistently evaded it, and by professing to regard Cockerell's tentative introduction of steps into the podium (soon abandoned on account of their disastrous effect on the portico) as his and Elmes's ideal solution have glibly claimed to be regarded in the light of pious restorers.

When that point was reached very little was needed to transform their part in the controversy into *opéra bouffon*, and the little was provided by the fatal suggestion that the site now occupied on the St. George's Hall plateau by the Beaconsfield statue would provide the most suitable position for the memorial, and that thus the podium might be left intact and no damage done to the fabric of the building. Instantly the promoters of the original scheme were able to count on the support of an increased number of Conservative members of the Council, and thenceforward at all general meetings when the matter was discussed the voting proceeded largely on party lines, a Tory majority of a third to a quarter settling every individual question in favour of the Memorial Committee—and this simply by reason of the suggestion to remove the Beaconsfield statue being construed as a covert attempt to insult the local Conservative party. Whoever was the author of that unfortunate idea we have never been able to discover, but he was unquestionably responsible for the temporary conversion of the issue into a political one with all the ludicrous consequences which ensued.

Now, fortunately, the blunder has to a large extent been repaired. The opposition have succeeded in demonstrating their freedom from political bias, and many of the most prominent Conservative citizens, who have at various times rendered distinguished service to the interests of Liverpool, are now working to preserve the Hall from violation. Throughout the struggle the *Liverpool Daily Post* and *Mercury* has given invaluable assistance, and has finally opened, and itself headed, a subscription list for those who wish to increase the fighting fund of the opposition. The response has been most satisfactory, and the tone of the covering letters

accompanying donations shows how profoundly the contemplated outrage is resented. From every point of view the list of subscribers is the best evidence of public feeling on the subject. The names include Sir William Lever, Sir Edward Russell, Sir William Forwood, Sir Edward Evans, Mr. W. L. Gladstone, Mr. A. Guthrie, Mr. A. A. Booth, Colonel J. P. Reynolds, Professor C. H. Reilly, Mr. Lawrence Holt, Mr. Rathbone, Mr. Sydney James, Dr. E. K. Muspratt, and a host of other notable Liverpool citizens. In addition to the proof which so influential an array of names assures as to the purity of motive inspiring the opposition, the fact that Mr. Chaloner Dowdall, M.A., B.C.L., a Conservative Lord Mayor, is acting with Mr. Rigby Swift for the opposition at the Local Government Board inquiry once and for all explodes the overworked theory that the political factor still counts. The plain truth is that, the Beaconsfield panic being over, men of every party realise with increasing clearness the folly of erecting a memorial involving an alteration of Elmes's design condemned by ninety-nine per cent. of expert opinion, national and foreign, and fiercely opposed by a large and distinguished body of citizens. A memorial to King Edward should, above everything else, be erected in a spirit of unanimity. To pretend that Liverpool is devoid of suitable sites is absurd. There are quite half a dozen admirable positions to be found, on any one of which Councillors more solicitous for the City's reputation than anxious to indulge a petty obstinacy could easily agree. The choice of one of these sites—say that by the Pier Head, for example—is the only way out of an intolerable impasse, the only escape from a situation of which everyone is weary.

It is too late now to urge the course that should have been taken by the defenders of Elmes's work. We think their stand should have been consistently that of "leave well alone." They should have insisted on the memorial being placed in some part of the city far away from St. George's Hall. By toying with adjacent sites they unwittingly created the dangerous impression that the Hall was not, after all, such a very sacred thing, that it might stand a little improvement here and there. And the enemies of the building were not slow to take advantage of that feeling and to profit by it to the fullest extent. However, we may safely trust to settle that delusion the expert evidence which some of the foremost architects in the country will give to the inquiry.

We have no desire to emphasise unduly the Liverpool Corporation's folly in attempting to amend such work as Elmes's and their publicly-proved incompetence to deal with æsthetic problems; but when the issues at stake are so vital it is essential that their ineptitude should be widely realised. The civic record in monumental work is catastrophic, and may be said only to have needed this last stupidity to render it unique. To take but one instance—the treatment of the area at the back of St. George's Hall, called St. John's-gardens. In so far as the majesty of the building can be affected by its surroundings, Elmes's conception

is damaged by the proximity of that grotesquely crude arrangement. Even Berlin's Sieges-Allee is a mature performance by comparison. Yet we had a thousand times rather that the Memorial Committee had added to the childishness of the "Stoneyard" (as St. John's-gardens are so aptly known) than have presumed to lay hands on the Hall itself.

Alas, we have learnt from bitter experience there is no hope that an appeal for them to retire from a position at once offensive and ridiculous will be treated otherwise than with an elaborate indifference! They have set their faces against retreat, continuing to pursue the policy they adopted at the beginning, ignoring all protest, however powerful, and all advice, however authoritative. But they may yet find that they are riding for a fall. It is one thing to render open spaces foolish and make great buildings suffer by proximity; it is another to seek the ruin of a masterpiece whose reputation is international, whose perfection and completeness are a precious heritage for all time. We shall be most profoundly surprised if the Government inquiry does not result in a refusal to sanction the provision of money for a memorial that will be a serious public inconvenience, do such irreparable mischief, and arouse feelings wholly alien to the memory of its subject.

NOTES.

Mr. T. G. JACKSON, R.A., writes to the *Times* on the subject of the condition of Sta Sophia, which he examined in 1910 at the request of the Ministry of the Efkat, which has charge of all the sacred buildings of Constantinople. The piers on which the four great arches abut are stated by Procopius to be built of solid stone run with lead, but Mr. Jackson, from what he saw, suspects they are largely built of brick. The outer buttresses on the north and south sides which resist the thrust of these arches are not so strong as they look, as they are honeycombed with chambers and stairs. The north-east pendentive is badly bulged, but the full extent of the damage can only be seen from the gallery which surrounds the dome, the plan being no longer circular but deformed, and the great arched ribs of the dome are similarly distorted and have in large measure lost their arch construction. Many parts of the building are, Mr. Jackson says, out of plumb, and some of the vaults in danger of collapsing. We join with him in hoping that means may be found to prevent "a catastrophe of unparalleled consequence," but the difficulties in the way of such help as would be efficacious being given, and received, seem to us very great if not unsurmountable. Were the church once more dedicated to "the Eternal Wisdom" and in the hands of the Greek Church it would be easier to approach the question of restoration.

The restoration works necessitated by the fire of October 19, 1906, which destroyed a large part of Selby Abbey, have been brought

to a conclusion by the completion of the rebuilding of the south transept, which was consecrated yesterday by the Archbishop of York. The cost, amounting to 8,000*l.*, has been defrayed by Mr. William Liversidge, a merchant and native of Selby, who has at various times since 1865 met the cost of restorations. These were carried out under the supervision of Sir Gilbert Scott and his son, Mr. Oldrid Scott, has acted as architect for the recent works. The damage done by the fire of 1906 was estimated at over 35,000*l.*, but so strong was the feeling that Selby Abbey was a national monument that funds for carrying out the restorations were almost immediately subscribed. Unfortunately as such destruction is, we may be thankful it did not happen in early Victorian days, since it would have meant the obliteration of all the interest and charm which our old churches possess, and which is usually retained under the more careful and scholarly hands of the architects of to-day.

THE awkward shape of the street connexions at Hyde Park Corner, which will not allow of the proper control of traffic, was indirectly the cause of a fatal accident on Wednesday, the 18th inst. A motor-bus proceeding up Piccadilly, whilst swerving to avoid a collision with a van crossing diagonally out of Hamilton-place, knocked down and killed an unfortunate pedestrian. The coroner, in summing up, said that these accidents would continue to happen so long as the traffic was allowed to thread its way in and out in this busy thoroughfare, and that it was a little surprising that more accidents did not occur there. He said that he thought it would be a good thing if there was a rule compelling cross traffic from Hamilton-place to Grosvenor-place to give way to the traffic going east and west. The jury returned a verdict of accidental death and exonerated the driver of the motor-bus from all blame. Such a verdict, however, is not entirely satisfactory; had they looked further into the cause of the accident they could not have done other than attach blame to the authorities responsible for the shape of the street. No city in the world possesses a finer force of police or better system for regulating traffic than London, but the police are powerless unless the street intersections are so designed that they can be controlled. In the days of the two-horse 'bus it was quite reasonable to expect vehicles crossing each other's routes to make way for one another and pass without accident, provided a spirit of forbearance existed; but to-day, when all sorts of traffic, from the private motor-car proceeding at high speed to the coster's barrow doing its four miles an hour, have to negotiate, not only police-regulated straight crossings, but also points where traffic is unregulated and proceeding diagonally, it is miraculous that more accidents do not occur. Together with the speeding up of modern traffic there must necessarily follow some alteration in the shapes of streets, and nowhere is this more necessary than at street crossings. The only intersection that can with safety be allowed in London to-day is that

which is at right angles, and the sooner the routes at Hyde Park Corner are reconstructed on these lines the better it will be for every one concerned.

Fire Inquiries and Loss of Child-life.

IN consequence of recent disasters, considerable public attention has been given to the consideration of possible means of reducing the loss of life at present suffered in connexion with certain widely-used commodities. Especially we refer to celluloid, of the dangers of which London has lately had a terrible demonstration, and flannelette, which has its almost daily victims, though it seldom provides tragedies on such a sensational scale as the former. One of the necessary preliminaries to efficient action is the accumulation of knowledge of the actual facts connected with fires, and the uninitiated would probably imagine that the causes and results of all serious fires would be carefully studied by some properly constituted public authority. But as a matter of fact this is not done, official inquiry being in most parts of the country restricted to cases in which death occurs in connexion with the outbreak. In Scotland powers exist to inquire into the causes of serious fires even though unaccompanied by loss of life, and in the City of London similar inquiries are held under the City of London Fire Inquests Act, 1888, with useful results. A Departmental Committee about two years ago recommended strongly that this system of inquiries into non-fatal but still serious fires should be extended to the whole country, and it is not easy to imagine why that recommendation is ignored. The *Manchester Courier* has been doing good work by a series of articles directing attention to these matters, and we trust that some reasonable legislation may result. In our issue of August 9 last we made some suggestions as to protection against the peculiar dangers attending the manufacture and use of celluloid articles. The precautions desirable in that case necessarily affect the arrangement and construction of buildings, but what our contemporary calls "the flannelette curse" can be dealt with to but a very limited extent, if at all, by regulations. We fear that flannelette or some similar material must be used until something better is invented, as the only possible substitute for that flannel or silk which, for obvious reasons of finance, must remain for the present almost equally out of reach of the very poor. To prohibit it would be to add largely to the suffering which winter brings and probably would involve a greater death roll from cold and its consequences than we now have from flannelette and other cotton fires. It should also be remembered that there are many cases of children being burnt by the ignition of woollen clothing as well as of cotton, and that if a child is left free to come into contact with fire nothing but fireproof clothing could give much safety.

Fire-guards in Tenement Dwellings.

It has been suggested that the duty of providing fire-guards should, in very poor tenements, be put upon the landlord, but we feel sure this

scheme would be a mistake. We have some knowledge of the treatment received by the landlord's property in many poor dwellings, and feel that in the long run the suggested additional duty of the landlord would come to be represented by an additional rent upon all accommodation which carried the new liability to provide fire-guards. The poor already (and unavoidably) pay a higher rent for given accommodation than do those who are a little better off, and we should regret to see any artificial addition to this inevitable misfortune. It might be possible for the building regulations to require the provision of a strong iron ring or socket in a standardised position upon each side of the fireplace in every living-room of a certain class of house and for the local guardians to keep a

Exhibition Buildings at "Shakespeare's England."

stock of guards, of a suitable character for hooking to the fixed rings, for loan to those too poor to buy their own. They would not be always or continuously needed, many would remain serviceable for more than one case, the public charge would not be great, and the scheme would probably work with less friction than the other and supply what is wanted with as little cost to the user as possible. That it is really false political economy to try to give any class something for nothing we are not concerned to dispute; we would urge that, having in so many things swallowed the camel, it is ridiculous to strain at the gnat, especially as the desirability of the end in view is one as to which we apprehend no discussion. We all agree that fire risks must be minimised.

Regent's Quadrant Committee.

WE learn with much satisfaction that a Committee has been appointed by his Majesty's Treasury to consider the design to be adopted for rebuilding the Regent-street Quadrant. This official recognition of the need for further consideration of the position will be welcomed by all who have taken part in the controversy, or who have followed the proceedings. We need scarcely repeat to the share taken by the *Builder* in the matter, culminating in the competition which provoked such widespread interest. The Committee consists of the Earl of Plymouth, C.B. (Chairman), Sir Henry Tanner, C.B., I.S.O., Reginald Blomfield, A.R.A., President of the Royal Institute of British Architects, Mr. John Murray, F.R.I.B.A., and the action of the Treasury in constituting the Committee has significance further than the discussion of the immediate question. It points to the acceptance by authorities of the principle advocated persistently by us, namely, that the erection of buildings should be subject to some sort of municipal control.

EXHIBITION BUILDINGS AT "SHAKESPEARE'S ENGLAND"

By A. O. COLLARD, F.R.I.B.A.

At one time people who were not practically associated with the architectural world of exhibitions were apt to regard it as sufficiently interesting for serious consideration. This was mainly due, no doubt, to academic dislike for anything in the nature of a sham, produced by a special form of construction not requiring thick walls, by kind of materials used, chiefly wood and plaster, and also owing to the limited period for which such work is required or assumed to be able to last. There has been of late years, however, a noticeable growth of tolerance in the matter, even extending to pronounced approval. It has taken about fifty years in the use of plaster externally to represent other materials to produce the feeling. It is realised that special circumstances may render such work desirable and necessary, as it certainly is, in many cases, attractive. The educational value, too, showing to modern city folk representations of old country and provincial buildings, a valuable means of arousing intelligent interest in architecture. Many charming results have been evolved since the Philadelphia Exhibition of 1876 by the employment of plaster out of doors, enabling clever designers to exploit their genius of originality or in reproducing old work not always accessible to the general public.

One might go further, perhaps, and add that occasionally an original plaster facade has been temporarily established which would give lasting satisfaction if translated into more permanent materials, though the conception would not have occurred had the possibilities of plaster been involved. For that matter, no one will deny that so-called permanent buildings would be objectionable were they constructed of imperishable materials than they really are. It is possible, too, to imagine that the stability of some better permanent building may be a source of anxiety when design of a minimum strength, under the Building Act, in order to approach as nearly as possible to a required accommodation within the narrow limits of an authorised expenditure.

The exhibition architect does not suffer so much as others from the difficulty of making accommodation and appearance tally with cost, yet even he does not often escape

the vital question of stability, in spite of the fact that he is not providing the future with ancient buildings, nor has to comply with the ordinary laws of construction. Stability in exhibition edifices is largely a question of wind pressure, a fact which becomes firmly impressed on the architect's mind when he comes to submit his plans for the approval of the authorities. Nothing will convince them that a proposed temporary structure, fondly supposed to be screened from the least breath of wind, is not exposed to every violent tempest that blows. To resist these assumed gales the main supports have to be buried deep in concrete, strutted and knee-braced; the roof principals have to be wind-braced and other provision made for complete security. This question of wind pressure cannot be evaded except when it is possible to build inside other buildings, as, for instance, is the case with some parts of "Shakespeare's England" which are sheltered within the protective areas of the Queen's Palace and Ducal Hall.

Though ordinary rules may be inapplicable, in London the requirements of the County Council and their District Surveyors have to be minutely studied and observed, for they naturally desire to protect themselves from the risk of passing anything of questionable safety. In the early days of public exhibitions, in London and elsewhere, apart from that mighty steel and glass structure, the Crystal Palace, the simplest forms of wood framing were used to receive the plaster covering, without much regard to the effect of the wind.

In speaking of exhibition buildings, it has to be borne in mind that the framework of those which are intended to last for a longer period than one season have, in London, to be certified annually by the District Surveyor as structurally fit for retention before the County Council will renew the temporary building licences. This class of building has gradually become comparatively expensive, much to the disgust of promoters who have to find the money. The authorities, anticipating their continued use for several years and the constant risk of fire, insist on steel framework, concrete flooring, and the elimination of wood and other inflammable materials in construction, even objecting to wood studding and battens to which fibrous plaster is most conveniently fixed, a method dear to the hearts of economical exhibition architects, who are expected to make a great display at a low cost. That objection to wood involves the use of plaster or cement on metal lathing or on concrete slabbing, which is, incidentally, a drawback to rapid construction, though obviously advantageous in arresting the spread of fire. Concrete slabs were used in the construction of the Globe Theatre at Earl's Court to assure sufficient stability in that case.

In this article it is not proposed to describe steel-framed buildings, nor the many curious kinds of structure known as joy wheels, gravity rides, and other mechanical devices which the public have been trained to expect and enjoy at exhibitions after they have sufficiently exhausted themselves by gazing at commercial exhibits. So strongly built are some of these steel-framed structures and devices that it would really not be unreasonable to regard them as permanent structures, thus dispensing with the annual fees for inspection and the renewal of licences.

The class of building to which attention is specially drawn here, and which is illustrated by some examples from "Shakespeare's England," is that intended for one or two seasons only, in which the use of wood framing is reluctantly permitted, covered inside and out with plaster or other approved fire-resisting material. Of all possible materials fibrous plaster is the cheapest and most adaptable, particularly when other materials have to be imitated. In thin slab form for flat surfaces, or cast in gelatine moulds for ornamental and

relief work of any description, it can be made and fixed by nails or screws with great rapidity. As to its durability, if painted annually with two coats of oil colour it will stand the weather for many years, as may be seen by the external plaster of the Imperial Arcade, a last remnant of the Indian Exhibition erected seventeen years ago. Its triumph was most definitely recognised in London when Mr. Imre Kiralfy opened that delightful exhibition, though Birch's old English Village at South Kensington a few years previously was a revelation to those who had not realised the wondrous virtues of fibrous plaster. Several kinds of vegetable fibre have been successfully adopted to reinforce plaster. In the plasterer's clause of an ordinary specification long cow-hair is usually demanded, but it is rarely supplied in sufficient quantity. It is an important means of reinforcement, the absence of which causes the failure of many ceilings in private houses. Cow-hair is too costly for use in the acres of exhibition plaster. In America the long thin grass of the prairie is often used. Nearly twenty years ago, at Earl's Court, a Dutch firm of plasterers had delivered to them a load of hay, supposed to be for bedding down their men, who were to sleep in the grounds. Instead of being used in that way it was chopped up as fibre for their plaster. Any misgivings on the subject were needless, for that plaster in the Empress Theatre is to-day as good as ever it was.

Mr. E. L. Lutyens, whose skill as an architect of permanent work has won for him the admiration of his professional brethren and other people of discernment, was commissioned by Mrs. George Cornwallis-West to design "Shakespeare's England" at Earl's Court on a portion of the exhibition grounds leased to her company by Earl's Court, Ltd. That distinguished and enterprising lady could not have chosen an English

period of greater attraction, nor one combining more happily architectural, historic, and literary interests. Mrs. Cornwallis-West succeeded in infecting all her workers with something of the spirit of those splendid Tudor days, and, in her own personality, seemed to revive certain characteristics of the Elizabethan period. In this connexion it may be noted that her own private administrative offices are on the ground floor of a fine old Tudor building, removed from the quay at Ipswich and re-erected next the Old Welcome Club in the Western Gardens of the exhibition.

The picturesque lay-out of that portion, formerly known as the Queen's Court of the exhibition grounds, with which Mr. Lutyens was chiefly concerned, if carefully examined, shows great ingenuity, not only in the ample footways left for public use, affording delightful vistas in all directions, but in the arranging, spacing, and scale of the buildings represented and in adapting them for the use of exhibitors. Several of the older plaster-faced buildings are completely hidden behind the present new façades, recalling many of the finest examples of architecture, both early and late Tudor, which adorned England when Queen Elizabeth, Leicester, Burleigh, Drake, Bacon, and Shakespeare were living realities. Among other sources of information Mr. Lutyens was able to avail himself of the measured drawings and photographs contained in Garner and Stratton's book on "Tudor Domestic Architecture," Gough's "Early Renaissance," and the Architectural Association "Sketch-books."

Accuracy of detail was evidently a strong point, and the plasterwork bears close inspection in that respect, partly due no doubt to the contractors, Messrs. Humphreys, Ltd., of Knightsbridge, who have an unrivalled experience in the technique of exhibition work. Great pains were taken to imitate closely what must have been the

Exhibition Buildings at "Shakespeare's England."

condition and colour of the buildings in those Tudor days, not merely as we see some of them now centuries later. This is a point which appeals to antiquaries but does not strike superficial observers, who have been heard to remark on the new appearance of some of the Elizabethan counterfeits, forgetting that at the time represented they actually were new. To complete the illusion thoroughly, the scenic artist has been carefully guided in his work, in order to produce correct impressions, and generally the colour brush has contributed the right tone and texture. Mention should be made, too, of the appropriate metal inn-signs and lanterns made by Mr. Starkie Gardner, of the wooden signposts and stocks, and the Tudor galley constructed by Messrs. Gill & Reigate, under the supervision of Mr. Seymour Lucas, R.A.

The framed wood construction used in the buildings is not particularly complicated. After making allowance for the temporary nature of these structures and the substitution of machine-cut deals of ordinary scantlings, the skeleton framing is not vastly different to the covered or exposed framing of old "half-timbered" buildings. Of course, experience, as in other building matters, enables the constructor to decide quickly what is best to be done, either beforehand or as the work proceeds. The height and area of each structure, together with the requisite rigidity and stability, are factors which influence the sizes of timbering used, which is, of course, not affected by the material that the plaster surface is meant to resemble.

The sectional-perspective views, given on one of our Plates in this issue, indicate, in a general way, one method of wood-framing, and show how flat plaster slabbing and ornamental and projecting plasterwork are attached to it.

The delicate oak tracery and the carving of the oak cornices and barge boards of such buildings as the Porch House, Potterne and Ford's Hospital, Coventry, are beautifully reproduced in plaster, such things as slender mullions being backed up by deal supports wherever liable to damage. The plaster "oakwork" is generally tooled over on the surface to imitate the texture of the original material, and is carefully tinted and grained flat. Where oak timbering is flush with the plaster, as at the Porch House and the Shakespeare's Head building, it has to be merely indicated by colour.

To obtain the nearest reality to an old wavy tiled roof, a mould in gelatine is made of some old roof tiling *in situ*, and the same process can be adopted for reproducing old brickwork. When the plaster in the mould is dry it is ready for removal and fixing in sections, and pointed to make good the joints. Another way is to construct some tiling to the desired appearance or build up a section of brickwork from which to obtain moulds. Merely to paint brickwork on a flat surface of plaster would not produce so good an effect, though that expedient may be adopted in cheap work or when situated at a considerable distance from the eye.

The examples reproduced at Earl's Court from Ashby St. Ledgers, Leicester's Hospital, the Trinity College Fountain, Ledbury Market Hall, Staple Inn, and Exeter Guildhall, besides others, show the plaster treatment of surfaces to represent stonework, helped as faithfully as the scenic painter can manage it in colour, the closeness of resemblance being, in skilful hands, largely a matter of price.

In reproducing old work or presenting novel designs and fitting them into the scheme of an exhibition the draughtsman plays an important part. Photographs, sketches, and visits to the originals assist him to prepare the necessary drawings, which expert plasterers can be relied upon to carry out sympathetically. The art of designing, constructing, and decorating exhibition buildings is, however, not a simple affair, so all connected with "Shakespeare's England" are to be congratulated on their successful achievement at Earl's Court.

PARIS NOTES.

PAINTERS will presently be no longer able to claim the distinction of having a picture in the Luxembourg. It has been ordained for some years that the present galleries shall be utilised for the accommodation of historical archives for the convenience of the Senate (it will be remembered that the old Palais du Luxembourg, of which the picture-galleries formed the Orangery, is now the Palais du Sénat). The permanent exhibition of works by contemporary artists which constitutes the Luxembourg collection is presently to be removed to the former Séminaire of St. Suplice, a building in the immediate neighbourhood of the present galleries. A movement meanwhile has been started among artists and others for the purpose of retaining the galleries of the Luxembourg for the exhibition of pictures and works of sculpture, the promoters of this scheme claiming that the galleries of the Grand Palais are insufficient for all the requirements of the annual art exhibitions.

The Paris authorities have at last set on foot a scheme for the lay-out in gardens of the ground on the borders of the Seine between the Pont des Invalides and the Pont d'Alma in the Cours la Reine, which has remained waste ground since the exhibition of 1900. The site is well known to students of French architecture, because it faces the famous François premier house which was transferred from Moret, near Fontainebleau, in 1826, to its present position in the Cours la Reine. François I., according to some authorities, caused this building to be erected for the reception of Diane de Poitiers; it is designed in the style with which the name of François premier is associated, with a suggestion of Venetian work—probably a reminiscence of the sovereign's predatory excursion into Italy. The new grounds are to be surrounded by an iron railing for the better protection of the plants and flowers, which suggests a somewhat unpleasant commentary on the conduct and manners of the Paris public. In our London parks no such protection is considered necessary.

Talking about gardens, it is interesting to note that the Société des Amateurs de Jardins is seeking to celebrate the third centenary of the birth of Le Nôtre by an exhibition of garden craft and art. It is proposed to hold the exhibition next year in the Pavillon du Marsan (by arrangement with l'Union Centrale des Arts Décoratifs). It will be largely retrospective in character, including plans and engravings of Du Cerceau, plans of Le Nôtre and his school, garden furniture of the same period, gardens of the XVIIIth century, and so on. It will also comprise vases and statues, examples of treillage, and the decorative features generally which have been employed in garden architecture by past masters of the art. In view of the fact that Le Nôtre was invited to England by Charles II., an invitation which it is generally believed he accepted, and that he may have been responsible for the disposition of the grounds of St. James's Park, for alterations at Hampton Court, and the gardens of other royal residences in or about London, the forthcoming exhibition should not be without historic interest to English visitors.

The classification of certain buildings, after proper and authoritative representation, as monuments of historic interest is one of the most useful regulations for the protection of past works of architecture which the French Government has at its command. The monastery of Chartreuse has, since the decree which disbanded the religious Orders in France, fallen into a state of dilapidation and disrepair. The present building, which superseded an older structure, and is of later date than 1676, does not possess many features of architectural interest, but what remains is worth preserving. Its recent classification by the Commission des Monuments Historiques will ensure the present stability of the buildings and their future preservation.

AN INTERNATIONAL COMPETITION.

THE conditions of a new international competition for architects have just come to hand. They present some interesting attractive features and some drawbacks. The buildings in question are a Royal Palace and a Palais de Justice at Sofia. So far the first building is concerned it is suggested that the style "Belvedere" should be adopted and to remove any doubt from the mind of any intending competitor what this style precisely represents a supplementary document provides the further information that by the use of the expression the style "Belvedere," the idea intended to be conveyed is that of a building *de belle apparence* with terraces, verandahs, balconies, etc., from which may be enjoyed a pleasant view of the surroundings. The term immediately brought to mind the little jewel of a palace in the Baroque style, with a touch of French Renaissance, at Vienna, although there are many other palaces of the Continent which bear this name. The Viennese type must have also suggested the term to those responsible for drawing up the conditions, for in the supplementary document to which we have referred this building is particularly indicated as an example of the style which it is desired to see chosen by the competitors. Probably the royal predilection entered into the matter of the choice of styles. For the Palais de Justice, on the other hand, *un style classique, sérieux et sobre* is recommended. Intending competitors will be provided on request with plans of the site and levels on which it is proposed to construct the buildings, as well as with photographs of their position and surroundings. In addition to these a list of the prices of materials and the cost of labour will be provided. The premiums are for the Royal Palace—1st prize, 10,000 francs; 2nd, 7,000 francs; 3rd, 4,500 francs; 4th, 2,500 francs. For the Palais de Justice—1st prize, 6,000 francs; 2nd, 4,000 francs; 3rd, 2,500 francs; 4th, 1,250 francs. The juries to be appointed for making the awards are variously constituted, but they include in each instance various high Ministers of State whose offices are associated either with the Royal Palace or the Palace of Justice, and three architects from the Ministry of Public Works, an architect appointed by the Bulgarian Association of Engineers and Architects, and three foreign architects. The foreign architects, who are to be chosen from Vienna, Paris, and Milan, are to be appointed by the architectural societies of these cities. Great Britain and Germany are not apparently taken into account. The conditions nevertheless seem on the whole, fair and reasonable, with some exceptions which are, however, of the utmost importance. They contain nothing to indicate the scale of remuneration for the architect who secures the work, or even that it shall be given to the winner of the first premiated design. Further, it is stipulated that all the premiated designs shall become the property of the Ministry of Public Works and that the jury shall have the option of purchasing any of the unpremiated projects, in the case of the Royal Palace, 4,000 francs, in that of the Palais de Justice 2,500 francs, which suggest points of interest that might be successfully utilised in carrying out of either scheme. These financial provisions will, we imagine, considerably reduce the number of competitors.

LAND TRANSFER.

At the annual provincial meeting of the Law Society, held at Cardiff this week, Mr. J. Rubinstein read a paper on "The Land Transfer Problem: Registration of Deeds and Registration of Titles." It was contended that the County Councils throughout the country should be empowered to establish local registries of deeds similar to the Deed Register now existing in the counties of Middlesex and Yorkshire, the profits of the registries to be applied, as in Yorkshire, in aid of the rates.

OLD HOUSES, CATHERINE-COURT, GREAT TOWER-STREET, E.C.

THESE illustrations are from photographs of houses and ironwork in Catherine-court, Great Tower-street, to be pulled down for the new offices of the Port of London Authority.

Catherine-court, which connects Trinity-square with Seething-lane, is situated just behind Mark-lane Station. It was built in 1723 and named after the Czarina of Peter the Great, who visited England 1716-17.

The Russian Embassy had their offices close by (in Muscovy-court). The houses of the court are typically Georgian, and were formerly used as dwelling-houses. They are now split up into offices in the heart of the wine trade. The present iron gateway of the court was erected about eighteen years ago; the remains of the original gateway are preserved on one of the walls inside the court.

Every Trinity Monday the Brethren of Trinity House, including the Prince of Wales, who is one of the Brethren, pay their annual visit to St. Olave's Church, Hart-street, and pass through Catherine-court.

Samuel Pepys lived for thirteen years near by, in a house in Seething-lane, connected with the Navy Office.

GENERAL NEWS.

Professional Announcement.

Mr. H. W. Ford, architect, has removed to new offices at 11, Old Queen-street, Westminster, and his telephone number will be Victoria 4474.

Appointment.

Mr. T. Herbert Whittaker, A.R.I.B.A., of Nottingham, has been appointed Chief Architectural Assistant to the county of Hereford.

Guildhall Improvement Scheme.

The Court of Common Council will consider on a special day the proposals to alter the buildings adjacent to the Guildhall. The scheme of Mr. Sydney Perks, the City Surveyor, which was illustrated in the *Builder* last week, is estimated to cost about 100,000l.

Victoria and Albert Museum.

The Department of Engraving, Illustration, and Design, of the Victoria and Albert Museum, has recently acquired, by purchase, a large number of original studies by the late Frederick Shields, for his well-known illustrations to Bunyan's "Pilgrim's Progress." When published, in the "Sixties," they received

Entrance to Catherine-court from Trinity-square, E.C.

high praise from Rossetti and other artists, as well as from John Ruskin. Two original pen-drawings by the late E. A. Abbey, R.A., have been given to the Museum by Mrs. Abbey; Mr. Stanhope Forbes, R.A., has given eleven etchings by the late Mrs. Stanhope Forbes.

Oxford Colleges.

Mr. B. T. Batsford will publish in November an important folio volume on "The Old Colleges of Oxford," by Mr. Aymer Vallance, M.A., F.S.A. The book has been in preparation for some years, and is dedicated by special permission to his Majesty the King. The author's scheme is to trace the architectural history of the University church, the old schools and the colleges, exhibiting them in the condition in which they stand at the present day, as well as many vanished features, depicted by famous contemporary artists from the XVIIth century onward. Care has been taken to include among the illustrations a large number of fine specimens of the splendid craftsmanship in ironwork, lead and plaster, in engraved brasses, painted glass, and figure sculpture, with which the ancient fabrics abound.

Medieval Figure Sculpture.

An "Account of Medieval Figure Sculpture in England," by Mr. E. S. Prior, the Slade Professor of Fine Art in the University of Cambridge, and Mr. Arthur Gardner, will be published shortly by the Cambridge University Press.

University Extension Lectures.

Among the courses of University Extension lectures which are now beginning, those to be given by Mr. Banister Fletcher, F.R.I.B.A., on "Ancient" and "Medieval" Architecture promise to be of special interest. The lectures will be delivered in the British Museum and in the Victoria and Albert Museum. Particulars may be had from the Hon. Secretary, 10, Woburn-square, W.C.

The Northampton Institute, Clerkenwell.

The new session of the Northampton Polytechnic Institute opens on the 30th inst. Day

and evening classes are held in a variety of subjects, full particulars of which are now published. Mr. C. E. Larard, A.M.Inst.C.E., is head of the mechanical engineering department, and Mr. R. Mullineux Walmsley, D.Sc., M.I.E.E., Principal of the Institute, directs the Electrical engineering department. The artistic crafts section is under the care of Mr. John Williams, with Mr. N. Vanderlyn as Chief Assistant.

The Polytechnic, Regent-street.

The Polytechnic School of Architecture and Surveying, which is recognised by the Board of Architectural Education of the Royal Institute of British Architects, and by the Board of Education, reopens on the 30th inst. The President of the School is Sir Aston Webb, R.A. Full particulars will be sent on application to the Director of the Polytechnic, Regent-street.

The day department is under the control of Mr. G. A. Mitchell, A.R.I.B.A., and the curriculum is based on the suggestions of the Board of Education and the recommendations of the Board of Architectural Education. The

Relic of Old Iron Gateway, now fastened to Wall of Catherine-court, Great Tower-street, E.C.

Nos. 3 & 4, Catherine-court, Great Tower-street, E.C.

Design for St. George's Parochial Building, Hornsey. By Mr. H. Kenchington, A.R.I.B.A.

full course covers a period of three years. The school has many successes credited to it during the last seven years, its past students including a Gold Medallist at the Schools of the Royal Academy. The evening school is intended for those preparing for the various professional examinations and for the craftsman in the various building trades. Mr. Charles Mitchell, M.S.A., is the Headmaster.

The Engineering School attached to the Polytechnic is under the direction of Mr. Henry J. Spooner, M.I.Mech.E., A.M.Inst.C.E., with Mr. Charles Hawksley as President.

DESIGN FOR ST. GEORGE'S PAROCHIAL BUILDING, HORNSEY.

This design was submitted in a recent limited competition by Mr. Herbert Kenchington, A.R.I.B.A.

The situation of the site at the corner of two important roads suggested an approach from each. By taking advantage of the rapid fall of the ground towards the north-east corner the kitchen and the retiring-room were planned on the ground floor and the small hall on the first floor without increasing the height of the roof above that of the main hall. Over the main entrance was placed the cinematograph-room, approached from the outside over the flat roof of the cloak-rooms.

The materials suggested were red bricks, with buff terra-cotta dressings, and the roof covered with Old Delabole slates.

BOOKS.

County Churches, Suffolk. By T. HUGH BRYANT. In two volumes, with illustrations. (London: George Allen & Co., Ltd., Ruskin House. 1912. 2s. 6d. each net.)

TO ANYONE making a survey of the churches of Suffolk these two little volumes will be welcome. They note the main characteristics of each church, and point out features of special interest in the fabric, and, where they have been allowed to remain the fittings, altar plate, and other objects of interest are noted. As some 530 old churches are described, the notes are necessarily condensed, but they are well arranged in alphabetical order under the rural deaneries as they exist at the present time.

Much the same was done for the diocese of Exeter as far back as "the forties." Many of the finer churches are illustrated by means of good photographs, and we notice with satisfaction that the illustrations only are printed upon calendered paper, thus making the books easy to handle and light to carry.

English Medieval Architecture. In two parts. By CYRIL E. POWER, A.R.I.B.A. (London: Talbot & Co. 2s. 6d. each net.)

THE subject-matter of these books, as the author points out, "was delivered originally as a series of lectures on Medieval Architecture." They contain a vast amount of information and over 400 diagrams and illustrations from line drawings in the text and eight plates from photographs, the whole bound in a handy and

compact form. In this respect we regard them as a marvel. Whether such an achievement has been accomplished without detriment to their usefulness is a question. As a synopsis to a course of lectures—and as such we must regard them—the subject-matter would fulfil a most useful purpose. Without the amplification which this matter no doubt received in the course referred to, we confess we find ourselves at a disadvantage when we endeavour to do justice to so painstaking an enterprise. Take an instance—not a very important one, but taken at random—a reference (on p. 495) to the little church of Clymington, Sussex—"In Saxon work, as at Bradford-on-Avon, the transept is little more than a porch. At Worth, and formerly at St. Pancras, Canterbury, the feature becomes much more important, yet built as adjuncts and subordinate to the nave. So also in the XIIIth century at Clymington and Achurch." No reader would gather from this that the "adjunct" on the south side is the tower of the church, which, belonging to the Norman period, is therefore not an adjunct at all. No attention is called to the unusual position of the tower, recalling the important example of Exeter, although a plan of the church is given some pages further on, an arrangement of plan and reference which we note to be inconveniently frequent. The reference we have quoted was no doubt made clear when extended in lecture form, but we cannot help feeling it to be inadequate and unconvincing as it stands. Information given in so condensed a form will, however, no doubt appeal to the student with examination tests in view and further means of reference at hand. The title, too, is somewhat misleading in view of the fact that the all-important developments of castellated and domestic building are not touched upon. English Medieval architecture embraces much more than church building, and the reader consequently puts the books down with an unsatisfied feeling. He also finds no acknowledgment of the sources from which the greater number of the illustrations are drawn.

Company Transfer Work: A Practical Guide to Share Registration and Transfer Work. By J. A. WHITE. (London: Effingham Wilson. 1p. 10s. 2s. 6d. net.)

THE author of this little work, who is the Assistant Secretary to the Associated Portland

Design for St. George's Parochial Building, Hornsey.

Cement Manufacturers (1900), Ltd., has compiled a guide, as the result of his own practical experience, on the subject of registration and transfer in connexion with limited companies, which, we should imagine, should prove useful to those concerned with this class of business.

British Standard Specifications for (1) Cast-Iron Spigot and Socket Soil Pipes, and (2) Cast-Iron Spigot and Socket Waste and Ventilating Pipes. Publications Nos. 58 and 59, respectively, of the Engineering Standards Committee. (London: Crosby Lockwood & Son. August, 1912. Price 5s. each net.)

THE Engineering Standards Committee have issued two further specifications dealing with soil and with waste and ventilating pipes.

In the Preface to each the Committee call attention to the desirability of making the internal diameter of the pipe agree with the nominal size. The departures from this rule which have been made from time to time for various usually quite insufficient reasons have led to much confusion and annoyance.

The specification in each case requires a slight reduction from the present London County Council allowance for caulking space in the sockets of pipes from 4½ in. to 6 in. diameter, which is decidedly an improvement. The thickness is kept uniform for all sizes, and agrees with the present London requirements, except in the case of the smaller soil pipes; these under the new standard will be ⅞ in. thicker than heretofore. This also is a desirable modification in view of the risk of slight eccentricity of the core in casting.

Each specification is accompanied by full details and tabulated dimensions for the various sizes of pipe, and for a number of the more usual fittings, including bends of various radii, access doors, swan-neck bends, branches, diminishing pieces, inspection pieces, collars, shoes, and holder bats.

In the body of the specification we notice what appears to be an oversight which might well be altered in the next issue.

It is required that the interior of the pipes and fittings be galvanised or "be coated with Dr. Angus Smith's . . . composition." It should be required that the pipes be "treated by Dr. Angus Smith's process," which is quite another matter, as it involves the heating of the pipes and much greater expense. The common use of the phrase now embodied in the new standard specifications has permitted the use of pipes which literally comply with its provision, and has, we believe, been the origin of a good deal of dissatisfaction. This, however, is the only point we notice which would be better altered; in all other respects we hope the standards laid down will meet with that general acceptance which their reasonableness would justify.

REDRESS BY ARBITRATION. By H. Foulkes Lynch. (London: Effingham Wilson. 5s.)

ENGLISH AND WELSH CATHEDRALS. By J. D. Atkinson. (London: Methuen & Co. 10s. 6d. net.)

ILLUSTRATIONS.

Alexander Thomson Studentship.

HIS studentship, value £60, is offered triennially by the trustees, the Glasgow Institute of Architects. In the recent competition Mr. James Bennett was successful, and his design is illustrated on one of our Plates.

The Royal Opera House, Malta.

It is barely fifty years ago that the Opera House at Malta was built. It may seem premature, therefore, to place it in the category of those worthy to be measured, but it is an interesting building in a variety of ways, and seemed to Mr. Collis desirable that the opportunity should not be neglected to record its features. The architect was Edward Middleton Barry, R.A., who, like his more eminent father, was responsible for many important buildings in London and elsewhere. Like other successful architects before and after him, he found fault with his times and wished he had chosen another career. In spite of his undoubted genius for architecture, he found many of the problems of his profession very difficult to adjust. His failure to be chosen as architect of the Law Courts and the non-realisation of his design for a new National Gallery caused him much disappointment.

Born in 1830, Edward M. Barry was a student at King's College, London, and then entered the office of T. H. Wyatt. In due time he became assistant to his father, and remained employed until the death of Sir Charles in 1860 at his house on Clapham Common. Meanwhile the son had earned an independent reputation by his reconstruction of Covent Garden Theatre after the fire of 1856, and in consequence of the success of this work he was appointed by the Government to erect the Opera House at Malta. He was engaged on the Palace of Westminster from 1860-70 in succession to his father. Elected an Associate of the Royal Academy in 1861, he attained to membership in 1869. He was Professor of Architecture from 1874 till his tragic death at a Council meeting at Burlington House in 1880, and during the same period was treasurer to the Royal Academy, an office which has been held always by an architect, with the exception of J. C. Horsley, father to Mr. Gerald Callcott Horsley, F.R.I.B.A. The present Treasurer is Mr. T. G. Jackson.

The Opera House at Malta was illustrated in the *Builder* in 1863, when it was in course of construction, and the following extract from the accompanying article may be quoted:—

"The new Opera House at Malta is one of several important public works for the embellishment and improvement of the island which

have marked the rule of the present Governor, Sir Gaspard le Marchant, Bart. It is situated at the entrance of the Strada Reale, the principal street in Valetta, and has been designed by Mr. Edward M. Barry. The auditorium will contain ninety private boxes in four tiers, accommodating, with pit, stalls, and gallery, upwards of 1,200 persons. As land in Valetta is exceedingly valuable, the ground floor of the theatre under the side corridors, and also the lower part of the terrace in front are occupied by shops; and, according to Maltese custom, residences are provided in the building for the principal artistes. Special arrangements have been devised to withstand the heat of the climate, and fresh air will be conducted to all parts of the house. The saloon, or crush-room, is placed over the entrance hall, and has five windows, with balconies overlooking the terrace. The painting-rooms and the necessary workshops are in the roof, which is constructed of queen trusses of a span of 64 ft.; the queen posts are carried up to support an attic with louvre windows and bold projecting eaves. The building is being constructed of the excellent stone of the island."

"Shakespeare's England."

The interesting buildings which form an attraction to the present Earl's Court Exhibition, and of which we give illustrations on one of our Plates, are referred to in the article beginning on p. 348.

R.I.B.A. Problems in Design.

BOTH Mr. Prestwich and Mr. R. F. Dodd, whose designs were published in our issue of last week, were students at the School of Architecture of the University of Liverpool.

MEETINGS.

COMPETITION NEWS.

A list of current Competitions is printed on page 366.

Legislative Buildings, Winnipeg.

We learn by cable from Winnipeg that Mr. F. W. Simon, F.R.I.B.A., has been successful in this important competition. Mr. Leonard Stokes, the assessor, selected the authors of five preliminary designs to compete finally. The chosen competitors were Messrs. E. & W. S. Maxwell, Montreal; Messrs. Sharp & Murray, Toronto; Messrs. Brown & Vallance, Montreal; Messrs. Clemsha & Portnall, Regina, East; Mr. F. W. Simon, Liverpool.

The successful competitor is in practice in this country and is well known for his individual work and for his association with Mr. Huon A. Matear, F.R.I.B.A.

Fire Brigade Station, Cardiff.

The design of Messrs. E. Vincent Harris & T. A. Moodie, London, has been placed first by the assessor, Mr. A. Marshall Mackenzie, A.R.S.A. Messrs. Ivor Jones & Percy Thomas, Cardiff, have been awarded the second place (75%); Messrs. Mangnall & Littlewood, Manchester, the third (50%); and Messrs. Willmott & Smith, Cardiff, the fourth (25%). The designs will be shown at the City Hall, Cardiff, October 2-9.

CORRESPONDENCE.

Architecture, Commercialism, and Public Rights.

SIR,—Your article on the above in last week's issue I read with interest and consider your views on the subject to be eminently sound.

The question of advertisement has grown to such an extent of late that we now have to treat it as one of the necessary evils of the modern business life. As regards the building itself as a means of advertisement, I think we generally find that attention is arrested by either a very good or a very bad design.

While agreeing that the bad design arrests attention, such attention is not that which the building owner desires, for it is never that of

Alexander Thomson Travelling Studentship, 1912. Awarded to Mr. James Bennett.

admiration, and I think this in itself will ere long bring its own reward. The thing that "lives" and bears the test of time is the only one that "pays" in its fullest sense.

I agree that "it would be often wrong to blame the building owner's architect for a bad design," though he should not always get off scot-free. Clients expect their architect to advise them, and when his advice is given in a tactful and proper manner, I have found by experience that it is generally of some use. The architect having planned his building to the satisfaction of his clients' practical needs should not be fettered on the question of design by his client, who cannot be expected to view the matter in the "broad" sense necessary to a good design.

Your remark as to the "unpleasing shop window used as a mark of distinction by a firm of restaurant proprietors," I am in entire accordance with, but can it be possible that, as a means of advertisement, it is more effective than the shop windows and fittings recently adopted by a well-known firm of booksellers and newsgaters? Yet the latter are by no means offensive; on the contrary they are a good solution of a very difficult problem.

So much for the "complaint," upon which we are at one, but what of the remedy? I agree with what you have to say as to the sympathy of the large landowner if we are to attain to a higher plane of street architecture, but your remark applies equally to the small landowner, for the remedy should be applied all round if it is to be effective.

We have, however, I think, to look further afield for our remedy of the present unfortunate state of affairs.

The approval of plans for buildings on land is at present generally restricted to the local authority and the freeholder's surveyor. The former views them from the point of view of its by-laws—often in themselves bad—and the latter from the point of view of their being a "commercial asset" to his client. Both are right in their respective spheres, but neither of them touch the point we want. We shall never, I think, get our street architecture into line until such new schemes have to be approved by an authority, to be set up, in the form of a "Tribunal of Art," which body would approach such new schemes entirely from the point of view of design in its broadest sense, i.e., in themselves good and appropriate to their surroundings; there should then be harmony, without which nothing but chaos can reign.

Such a tribunal might consist of, say, three architects and artists of repute, acting together and in co-operation with the local authority, who would then have the entire responsibility for, and interest in, its own district, which should belong to it by right. At present if any local authority be approached on the question, it will generally be found sympathetic, but reply, "We have no power over design."

If such a course were followed, another

section of the community would have become interested, and so by degrees the public generally would lend its sympathy and support, without which, after all, we cannot progress far. It would certainly take some time to accomplish a complete change from the present bad state of affairs, but not longer than it has taken us to get into it.

HERBERT A. WELCH, A.R.I.B.A.

INTERCOMMUNICATION COLUMN.

A Two-Story Building Defined.

SIR,—I shall be greatly obliged if you will kindly give me an answer to the following questions—What is a two-story building? How many floors does it contain, including ground floor (a non-basement house)? Thanking you in anticipation,
E. J. WEYMOUTH.

[*] We do not know if any subtle reason caused our correspondent to ask the above questions. While we do not wish to be involuntary parties to a betting decision or building dispute, we hope it is not indiscreet to offer the suggestion that, in a general way, a two-story building, without a basement, contains two floors, that is to say, a ground floor and a floor over it, which may be wholly or partly in the roof, or may have a flat roof. As the inquirer writes from an address in the Metropolitan area, the following definitions of the London Building Act, 1894, Part I, Clause 5, may interest him:—

"(11) The expression 'ground story' means that story of a building to which there is an entrance from the outside on or near the level of the ground, and where there are two such stories, then the lower of the two:

Provided that no story, of which the upper surface of the floor is more than 4 ft. below the level of the adjoining pavement, shall be deemed to be the ground story.

(13) The expression 'first story' means that story of a building which is next above the ground story, the successive stories above the first story being the second story, the third story, and so on, to the topmost story;

(14) The expression 'topmost story' means the uppermost story in a building, whether constructed wholly or partly in the roof or not." We assume the questions do not involve consideration of the height of the building, the heights of the stories, nor the thickness of walls, which are points dealt with in the first schedule of the same enactment.—ED.]

ENGINEERING SOCIETIES.

The Institution of Municipal Engineers.

At a meeting of the Council held on September 18 the following applicants were recommended for admission:—

To membership:—Mr. R. L. Price, Surveyor, Dawley Urban District Council; Mr. T. Rosbotham, Surveyor, Southport, Birkdale, and West Lancs Water Board; Mr. H. Plewes, Surveyor, Thorne Rural District Council.

To Associate membership:—Mr. S. F. Dean, Chief Assistant, St. Mellons Rural District Council; Mr. R. E. Miles, Assistant Engineer and Surveyor, Horbury Urban District Council; Mr. H. E. Morris, Surveyor's Office, Hereford Rural District Council; Mr. F. J. Felts, Borough Surveyor's Office, Cambridge; Mr. C. Thomas, Assistant Surveyor, Llanelly Urban District Council.

Transfer to membership:—Mr. F. Britton, Surveyor, Dore Rural District Council; G. E. Mathews, Engineer and Surveyor, St. Holland Drainage Trust.

Under the new by-laws these elections will be ratified at the next Council meeting if no written objections are lodged within fourteen days. The annual meeting will be held in London on October 11 and 12. Various papers will be read and visits will be paid to places of interest.

FIFTY YEARS AGO.

From the *Builder* of September 27, 1866.

Our Bridges.

THERE is scarcely a city founded upon a navigable river, and occupying space both margins, that has not, according to extent, more free bridges than London. There are in a two-mile course of stream, from Houses of Parliament to the Customs, bridges for traffic, with one footway, peddled space; and of these only three are free to the public! Paris can boast of less than fifteen bridges in the same extent, and *without a toll*; and yet who would compare the amount of commercial intercourse required by either community? We have nearly the one-third portion of the metropolis on the southern margin of the river. In Paris, the Seine makes a narrow division; but the flow of the Thamez which describes an arc of a circle, requires yet more increased facilities of intercommunication. On the north bank the country from London to Westminster Bridge is scarcely a mile and a half. A stranger visiting the Surrey side, having taken notes from the Tower to Hyde Park, could hardly account for the dusky, gloomy, and staid aspect of Southwark and Lambeth. There appears to be neither unity nor community in these heterogeneous parts; but he who is a Parisian, he at once discovers that peculiarly English system of toll bridges is the cause of suspended animation.

*** The "suspended animation" referred to in the above paragraph could scarcely refer to a matter of complaint with regard to the traffic, whether pedestrian or vehicular, of our London bridges. But since it is written the tolls have happily been done away with. The Metropolitan Toll Bridge Act of 1877 required the Metropolitan Board to extinguish the tolls on all the Thamez bridges. Within the last fifty years bridge accommodation across the Thamez has been largely increased either by addition of new bridges or the substitution of new and more ample structures for old. Blackfriars Bridge was opened in 1818, Albert Bridge in 1873, Wandsworth Bridge in 1880, Battersea in 1890, the Tower Bridge in 1894, and the new Vauxhall Bridge in 1906. Paris, within the same period, has not shown the same activity, because it has not had to meet the same necessities and partly because its river was already well supplied with bridges. The Pont Alexandre Trois, which was opened in 1901, easily eclipses anything that has been done either in London or any other capital in the way of beautiful bridge architecture. We are not inclined to agree with those who draw comparisons between the two capitals to the disadvantage of London, but it would be absurd not to acknowledge that in questions concerned with the improvement of Paris, the French authorities show in some respects, a more enlightened policy than that which prevails in this country.—ED.

Fig. 1. Derricks in Operation in the Rue des Italiens, Paris.

[Photo, by Demoulin.]

Fig. 2.

CONJUGATE DERRICKS FOR THE ERECTION OF STEELWORK:
RUE DES ITALIENS, PARIS.

IN a previous issue (February 9, p. 153) we described and illustrated the structural and architectural features of the buildings erected on either side of the new street in Paris known as the Rue des Italiens.

The steel skeleton of the block at the left hand of the street has two façades, one of 28 metres on the Boulevard des Italiens, and one of 61 metres on the Rue des Italiens. The party wall separating the building from No. 32, Boulevard des Italiens is nearly at right angles to the line of the boulevard for a length of 36 metres, thence following an irregular polygonal contour causing the width of the site to diminish towards the upper end.

As most of the apartments in the new building had been let even before construction had been commenced, the time allowed to the contractors for erection was very short considering the large amount of work to be done, and it was indispensable that powerful construction plant should be installed for the erection of the steel skeleton within the stipulated period.

In order to obviate the employment of scaffolding or staging of the kind generally used in building construction, the contractors, Messrs. Baudet & Donon, arranged with Messrs. Louis Perbal & Cie., of Nancy, for the installation of two conjugate derricks, each capable of being rotated through a complete circle.

The type of derrick in question may be described as a perfected form of the ordinary derrick, the main objects of the inventor having been to provide facilities for commanding a maximum area and to avoid the necessity for the encumbrance of the building site by staging of the usual character.

Instead of being capable of angular movement to the extent of only about 200 deg., as in the case of an ordinary derrick, the new type of crane can be rotated through a complete circle, and turned round and round in either direction as often as may be desired.

As shown in Fig. 3, each derrick consists essentially of a vertical shaft pivoted at the top and bottom and carrying near the upper end a horizontal arm furnished with rails for a travelling carriage from which the loads to be hoisted and otherwise dealt with are suspended by means of wire ropes and the usual tackle.

The vertical shaft is a latticed steel structure tapering to a point at each end, the bottom bearing supported on a foundation block in the ground, and the top bearing carried by two latticed steel stays disposed at an angle of 60 deg. apart in plan so as to be capable of resisting either tension or compression according to the direction in which the rotating arm of the derrick is moved, and made of strength sufficient for withstanding flexure due to the action of the wind and the dead weight of the construction.

The stays are slightly inclined to the horizontal, the outer end of each being supported by a steel tower. In the case of a single derrick these towers are generally in the form of sheer legs with one vertical member and two inclined members.

The double or conjugate derricks of the type erected at the Rue des Italiens require only two supports for the four stays carrying the upper pivot bearings, as represented in Fig. 4, where it will be seen that the two stays

meeting over the Rue des Italiens are supported by a sheer leg tripod, and that the other two stays meeting near the party wall next to No. 32, Boulevard des Italiens, are carried by a light steel tower, triangular in plan. This tower was tapered to a point at the upper end so as to provide clearance for the passage of the rotating arms of the derricks.

As the top bearing of each rotating shaft is above the horizontal arm from which the loads are suspended, it will be readily seen that there is nothing to prevent the complete and continued rotation of the arm in either direction.

All forces acting upon the derricks, whether due to the loads suspended or to the pressure of the wind, give rise to resultant forces upon the upper stays and the points of support.

Consequently, according to the direction of rotation and of the wind each leg of the tripod and each main vertical of the triangular tower works alternately in tension and in compression.

Therefore it is necessary that the foundation blocks for the supports should be constructed so as to be able not only to distribute pressure on the soil at suitably reduced intensity, but also to withstand forces tending to lift them from their beds.

The form and general arrangement of the supports for the conjugate derricks employed at the Rue des Italiens was decided by the following considerations:—

1. The requirement that the new street should be opened to traffic, connected with the erection of the buildings, before the derricks

Fig. 3. Elevation of Derrick: Rue des Italiens, Paris.

(From Le Génie Civil.)

could be dismantled and removed from the site, and

2. The desirability of avoiding interference with the erection of steelwork on the site of the left-hand block of buildings.

The first consideration clearly indicated the shear-leg type of support as the most suitable, because the space between the vertical and inclined legs would permit the circulation of traffic on the new roadway, while the second consideration led to the adoption of a compact vertical tower offering far less obstruction to steelworkers than the wide spreading legs of a tripod support.

In selecting the positions for the three vertical posts of the tower and in determining the positions of the bracing members for the same structure, care was taken to place all of them between the stanchions and girders to form part of the steel skeleton, the bracings being placed as far as possible so as to come between the successive floor levels. Thus, after removal of the derricks the only permanent members of the skeleton to be fitted were a few floor joists.

Thanks to this arrangement, it was possible for the contractors to place all important members of the steel frame in position by means of the conjugate derricks, the result being a considerable saving of time and expense.

All the movements necessary for the operation of each derrick are controlled by one man from the operating cabin shown in Fig. 3. The cabin is fitted like the eagle of a lift on the rotating shaft and can be raised as work progresses to enable the mechanic to command a view of the entire site throughout the conduct of building construction. The motor and gear cabin is built inside the rotating shaft below the bottom position of the operating cabin.

The means of control provided in each of the latter enable the attendant to regulate the traversing movement of the carriage running backwards and forwards on the horizontal rotating arm, the rotatory movement of

the derrick, the hoisting and lowering movements, and changes of speed for the hoisting gear.

The traversing movement of the carriage on the horizontal arm and the rotation of the vertical shaft are effected by means of an electric motor of 6 kilowatts capacity supplied with continuous current at 220 volts pressure, and arranged so that the two movements can be performed separately or simultaneously as desired. The carriage is traversed by means of an endless wire rope proceeding from the motor and gear cabin to the top of the rotating shaft, passing over a guide pulley there, proceeding thence along the horizontal arm, making connexion with the carriage and returning to the cabin.

The rotation of the derrick is effected by another endless wire rope passing over guide pulleys and around the crown wheel at the top of the rotating shaft, this wheel being of 4 metres diameter and grooved for reception of the wire rope. The crown wheel is fixed to the shaft, which is moved in the required direction by the pull of the endless rope.

For hoisting purposes, a second electric motor of 9 kilowatts capacity is fitted in the cabin, where the hoisting cable is wound about a drum.

The following particulars will enable our readers to form an idea of the capacity of the derricks, and their convenience for the execution of structural work:—

Diameter of circle commanded by each rotating arm, 40 metres.

Height of rotating arm above ground level—Derrick No. 1, 42 metres; Derrick No. 2, 39 metres.

Time required for complete rotation of arm, 4 minutes.

Traversing movement, per minute, 20 metres.

Hoisting movement, length of cable on drum per minute—Quick speed, 40 metres; slow speed, 20 metres.

Lifting capacity of derrick, 5 tonnes.

The speed at which loads can be raised depends upon the weight to be dealt with and

the gearing employed, the average speed being as follows:—

Load.	Gearing.	Height Hoisted
Kilogrammes.		Metres.
2,500-5,000	Slow speed	5 per minute
Less than 2,500	Quick speed	10 per minute
1,250-2,500	Slow speed	10 per minute
Less than 1,250	Quick speed	20 per minute

The derricks installed at the Rue des Italiens were arranged so that they commanded not only the whole of the building site, but also considerable areas over the new street and a portion of the foot pavement in the boulevard.

Moreover, as the rotating arm of No. 1 derrick was 3 metres higher than the corresponding arm of No. 2 derrick, the two appliances were available for use at the same time without mutual interference, and as the zone of action of the derricks overlapped to the extent denoted in Fig. 4 part of the building site was commanded doubly.

The latter facility proved of great convenience during the early stages of construction before the Rue des Italiens was open to vehicular traffic. At the period in question the only means of access to the site for goods was by way of the unloading platform (Fig. 4) of the Boulevard des Italiens.

Materials there delivered by lorries were hoisted by derrick No. 1 and transferred to required positions on the front part of the site or to a point in the overlapping zones, where the materials were taken up by derrick No. 2 and thereby delivered to required positions on the back portion of the site.

Thus the conjugate action of the derrick enabled the contractors to handle materials mechanically over the entire area.

After the roadway of the new street had been completed and opened to traffic, the two derricks were employed independently for the reception and handling of materials.

Figs. 1 and 2 show the derricks in operation and also include a view of another type of crane supplied by Messrs. Perbal & Cie.

The latter, entitled the "Mât Grue," or mast crane, comprises four elements—a track for travelling motion, the mast, the crane proper, and the operating mechanism.

The track consists of two rails, one at ground level and the other 10 metres higher. The first is an ordinary railway rail, and the second a rail of special broad flange I-section, supported at intervals by channel bars with cast steel connexions. The track is usually constructed along the entire length of the building site.

The mast is a lightly built steel tower, usually

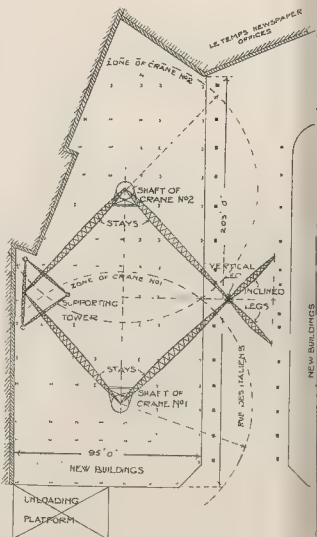

Fig. 4. Plan showing arrangement of Derricks.

it up to 40 metres high, composed of four uprights connected by bracing, and as the lower part of the mast is of reduced cross-section, the appliance reduces obstruction in the street to a minimum. The head of the crane is provided with a cantilever platform for the attachment of the crane, the platform projecting towards the building line in order to increase the radius of action of the crane.

The upper portion of the mast is square in cross-section, and is fitted with a fixed cabin for the motor and gearing, and a travelling cabin for the mechanic in charge, this cabin being arranged to move up the mast like the cage of a lift.

The crane jib projects 3.25 metres beyond the centre, or 4.55 metres beyond the axis of the mast, and can be rotated through a complete circle 6.5 metres in diameter. It is capable of dealing with loads up to 3 tonnes.

The operating mechanism includes a windlass for gearing for travelling and rotatory movements, preferably worked by an electric motor. An operating cabin is provided with means for controlling all the movements of the crane.

Although not taking the place of large derricks, the mast crane is of special value in erecting the façades of buildings. It occupies very little space outside the building line, and has the manifest advantage of obviating the employment of cumbersome staging as requisite for ordinary travelling cranes.

REINFORCED CONCRETE PONTON: MANCHESTER SHIP CANAL.

An interesting example of reinforced concrete construction is furnished by the pontoon recently launched at Islam for employment in connection with the dredging operations conducted on the Manchester Ship Canal. The structure given on this page is from a photograph taken on the occasion of the launch. The pontoon was designed by the late Mr. Robert Congreve, M.Inst.C.E., for whom details the reinforced concrete work were prepared the Hennebique system by Messrs. L. G. Nichol & Partners. The vessel measures 11 ft. long by 28 ft. wide by 8 ft. deep from the keel to the main deck, and is constructed with longitudinal and transverse bulkheads dividing the interior into a number of perfectly tight compartments. The framework consists of reinforced concrete columns and beams, the outer skin and the interior partitions being only 3 in. thick, except beneath the coal bunkers and boiler-house, where the thickness is increased to 4 in. An upper deck or part of the vessel provides foundations for the engines and pumping machinery.

The pontoon has been built for the purpose of pumping sludge from barges filled from the dredgers, and of discharging the materials through long delivery pipes over low-lying lands in the neighbourhood of the canal, thus facilitating the economical disposal of

sludge and at the same time raising the level and improving the soil of the areas selected. The vessel will be towed to the required points, and there moored for as many days or weeks as may be convenient, being moved from place to place as necessitated by the exigencies of dredging operations.

THE STRUCTURE OF GALVANISED IRON.

W. GUETLER, in the *International Zeitschrift Metallographie*, states that he has been investigating the structure of galvanised iron, and finds that sections cut obliquely through the outer layers of galvanised iron show that the zinc and iron are separated by an intermediate layer of crystals of the compound Fe Zn_2 . This compound is more electronegative than either iron or zinc, and thus accelerates corrosion if exposed. The zinc layer contains isolated crystals of the compound Fe Zn , which is also electronegative.

Zinc deposited from vapour by the dry process, or from solution by the electrolytic process, is porous, and also contains minute crystals.

Von Vegesack in 1907 (see the *Journal of the Society of Chemical Industry*, Vol. 28, p. 153) prepared an equilibrium diagram of zinc-iron alloys showing that iron dissolves in molten zinc to at least 24 per cent. Following up this fact Messrs. W. Arthur and Mr. H. Walker, in the *Journal of Industrial Engineering and Chemistry*, 1912, designate the crystals of unknown composition which first separate from the melt as "binding alloy." A number of samples of galvanised iron prepared by the hot galvanising, "Sherardising," and electrolytic processes have been examined micrographically in cross-section, a 0.5 per cent. solution of nitric acid in 95 per cent. alcohol being used for etching, with the following results:—

Hot Galvanised Iron.—In a section of ordinary galvanised iron four layers can be distinguished, viz., the iron, a very thin layer of the "binding alloy," a layer of the compound Fe Zn_2 , and a layer of zinc, which is permeated by minute crystals of the compound Fe Zn . If the immersion in the galvanising bath be prolonged, much larger crystals of Fe Zn are produced.

If an ordinary galvanised plate be treated cautiously with caustic soda, the zinc can be dissolved away so as to leave the minute needles of Fe Zn , visible against the darker polygons of zinc. The parting of the coating when a piece of galvanised iron is sharply bent takes place at the surface of the "binding alloy," but in the blistering and subsequent "flaking off" observed when galvanised iron is heated, the parting takes place between the zinc and the compound Fe Zn_2 .

Sherardised Iron.—According to the temperature, time, and composition of the zinc-powder mass employed, the coating may vary from a very thin layer of the alloy Fe Zn_2 with a

more or less distinct layer of the "binding alloy" to a thick coating of zinc iron alloys with a surface layer of zinc. In all Sherardised coatings numerous cracks running through the alloy can be observed.

Electrogalvanised Iron.—According to the conditions, coatings of very pure zinc or of zinc-iron alloys of widely varying composition can be obtained, but in all cases there is a very thin layer of "binding alloy."

Emile Vigonroux, F. Duccellier, and A. Bourbon have investigated the iron-zinc alloys by means of electromotive force, and their results are set forth in the *Bulletin Société Chimie* of 1912. A series of such were prepared by melting the two metals together in a current of hydrogen. The E.M.F.'s developed when the various alloys so prepared were opposed to poles of zinc in a twentieth-normal solution of zinc sulphate were measured.

Limits of Iron Percentages in Alloys.		Definite Compounds Deduced from E.M.F. in Volts.	
Lower.	Higher.	Formula.	Per Cent. of Iron.
10.9	21.0	0.115 Fe Zn_2	10.9
22.9	71.0	0.144 Fe Zn_2	22.9
73.1	80.0	0.35 Fe_2Zn	71.9
82.5	87.8	0.39 Fe_2Zn	81.1

The conclusion drawn from the results given in the table is that four definite compounds of iron and zinc exist, having the simple relations shown, and that the first two of these have been found previously by Von Vegesack (see above).

ANCIENT IRON BEAMS IN INDIA.

The best-known examples of large forgings in India are the iron column at Delhi, 23 ft. 8 in. high by 16½ in. to 12 in. in diameter; and the larger column at Dhar, now broken into three pieces and originally measuring 43 ft. long by about 10 in. to 11 in. square, the latter dimensions being only roughly approximate owing to the irregular form of the column.

At the Black Pagoda of Orissa, Kanarak, there are some very large forged iron beams, which although less generally known than the pillars mentioned are more interesting architecturally.

The two largest members, as described by Mr. H. G. Graves, of Calcutta, are 35 ft. long by 8 in. square, and 25 ft. 6 in. long by 11 in. square. The latter beam has one end broken off, so that its original length is uncertain, but the piece remaining weighs about 9,000 lb., its end indicating that the method of construction was by the welding up of billets.

The age of the temple has been discussed from time to time, the period of its construction being placed by some as early as the 11th century, and by others as late as the 13th century. It is probable that the earlier parts were commenced at the first-mentioned time, and that the building was completed three or four centuries later.

Bishan Swarup, in a work published by the Bengal Government in 1910, expresses the opinion that the ruin of the pagoda was caused mainly by the removal or the collapse of the heavy top of the corbelled-in roofs, which, in consequence, sank inwards and fell down.

The iron beams, of which many still exist and lie scattered around the building, were originally used as supports under the door lintels and in the roof corbelling. Similar beams on a smaller scale are to be seen in the Garden Temple at Puri, where the images of Juggernaut, Balabhadra, and Subhadra are taken on cars in June or July every year.

As the Kanarak Temple has been closed up and filled in with masonry and sand to prevent further falls, it is not possible to ascertain the original position of the beams or whether any are still in place.

Most of the beams exposed have been broken by the fall, some being seriously rusted and others very little affected, or having a thin and closely-adhering skin of oxidised metal.

Examination indicates that the beams were made by welding together small blooms of 3 lb. to 4 lb. in weight, and measuring 1 in. square, 2 in. square, or 2 in. by 1 in. In some places the blooms appear to have been welded together in strings to form short bars, which in turn were welded into place. No special care seems to have been taken to make the blooms

Reinforced Concrete Pontoon.

break joint either longitudinally or transversely, but the longitudinal welds are approximately of the lapped type.

The beams are nearly all of uniform size and square in section from end to end. The designers do not appear to have appreciated the advantage of making the depth greater than the width of the beams, which are so imperfectly welded that they could never have been of much structural value, although constituting remarkable examples of smith's work.

ENGINEERING NOTES.

A Large Elevated Reservoir.

THE extensive sanitary improvement undertaking now in course of realisation by the city authorities of Buenos Ayres involves the expenditure of some 3,500,000, one remarkable feature of the project being an elevated reservoir to be constructed at Caballito. This reservoir will consist of three tiers of steel tanks with the aggregate capacity of about 16,000,000 gallons, which is far greater than that of any metal reservoir hitherto constructed in any part of the world.

The tanks will be supported on cast-iron columns with concrete foundations. Water will be pumped into the reservoir from the River Plate.

ONE of the most important The Sara Ghat engineering works projected in Bridge, India. India is the new bridge designed to carry the Eastern Bengal State Railway over the River Ganges at Sara Ghat, nearly 120 miles from Calcutta.

The bridge will comprise fifteen lattice girder spans, each 359 ft. long by 52 ft. deep at the middle, and its width will be 32 ft. from centre to centre of the main girders, or 42 ft. 6 in. over all.

One end of each girder will be carried on fixed steel bearings, and the other end on similar bearings, with provision for expansion and contraction.

The bearings will be at the top of piers extending down to 60 ft. below low-water level and founded on steel caissons, measuring 63 ft. by 36 ft. sunk below the bed of the river. The caissons will be floated out to predetermined positions and sunk, additional sections being added and filled with concrete until the cutting edge of the caisson has reached the river bed. The foundations so formed are to be finished by a cap of concrete from which the masonry piers will be built up.

Considerable competition occurred among engineering firms anxious to obtain the contract for the steel girders, and the leading American bridge companies were especially active in this direction. Therefore it is particularly satisfactory to note that the work was allotted to two British firms of structural engineers.

The whole of the substructure and the erection of the steel girder spans will be undertaken by the Indian Government staff under the direction of Mr. R. R. Gales, in accordance with the designs of Sir Alexander Rendel, Consulting Engineer to the India Office.

By the completion of the new bridge the present necessity for ferrying across the Ganges will be obviated and direct railway connexion will be established between Calcutta and the Himalayas.

DURING the early part of last Canadian City it was decided by the Bench Marks, city authorities of Edmonton, Alberta, to establish a complete system of bench marks for survey purposes. The bench marks, installed under the direction of Mr. C. C. Sutherland, of the Roadways Department, were made by boring an 8-in. hole 7 ft. 6 in. below ground level, and filling it up with concrete mixed in the proportions of 1:2:5. The upper 18 in. of concrete is enclosed in a piece of 6-in. diameter cast-iron water-pipe, acting as a sheath, and allowing the top of the bench mark to project 6 in. above the surface. In the upper end a 1-in. square brass bolt is embedded to the depth of 8 in., passing through a number-plate of the same metal, the mark being protected by a wood cover. From the main system, secondary bench marks have been established to cover the entire area within the city boundaries. The secondary marks are of three kinds for undeveloped, residential, and business districts, respectively. In undeveloped areas the mark

simply consists of a railway spike driven into a telegraph or electric-light pole. In residential districts, the bench marks are similar to those in the main system, and placed where they can be seen from different directions. In the business area, the marks are similar to those in the main system, but provided with a cast-iron cap flush with the foot pavement level, and they are placed at corners, 3 ft. back from the curb, so that they may be seen from several directions, and be out of the way of telephone and electric-light conduits. The complete system gives a series of elevations throughout the city that are as correct as it is possible to make them with an ordinary engineer's level, and as shown by the closing error the elevations are nearly perfect.

Boulogne Harbour.

THE new Bassin Loubet, begun nine years ago, has recently been opened for maritime service. It provides quaysage of a total length of 1,000 metres, the west side being 200 metres, and the north and south sides 320 metres in length, with a mean water-depth of 13 ft. below low-water mark. The dock occupies a site, in part reclaimed from the sea, in the sand dunes of Capécure and Chatillon, on the south-west of the present harbour, and the outlay, including the new Douane, wharves, warehouses, etc., amounts to more than 503,000. Further improvements will shortly be undertaken, and will comprise a rebuilding of the Quai Gambetta, the Gare Maritime, and the Quai Chanzy (with extension and widening), and a new north-east pier, of stone, to cost 280,000, which will replace the existing wooden jetty of 1829, and afford an entrance into the harbour, widened from 70 yds. to 140 yds. The break-water is being extended by 600 metres to a total of 2,720 metres, at a cost of 490,000, and tenders are invited for completing the deep sea outer port at an estimated outlay of about 1,200,000.

Allahabad Bridge.

MESSRS. RENDEL & ROBERTSON, of Westminster, made the designs for the widening of the East India Railway Company's bridge across the Jumna, at Allahabad, for which all the steelwork is being supplied by Messrs. Head, Wrightson, & Co., Ltd., of Thornaby-on-Tees. The widening provides for a double railway line, and comprises fourteen double-deck and two approach spans, the latter being 45 ft. 7 in. long apiece. The upper deck is composed of cross-girders, rail-bearers, and plated decking; the lower is of pressed trough flooring laid on cross-girders and carries a roadway 13 ft. 3 in. in width between the kerbs. The plated decking is secured to cantilever brackets of the approach spans, which take a single line to the top deck of the main spans.

UNDER the direction of Mr. St. Ann's Well, F. Langley, the Borough Surveyor and Water Engineer to the Buxton Urban District Council, some alterations have recently been made to the pump-room at the famous St. Anne's Well, which is an important feature of the town of Buxton.

The exterior colonnade has now been taken into the pump-room by filling in the spaces between the columns with ashlar and windows, and the original outer wall has been removed, the opening being spanned by steel girders supported by two newly-built brick piers.

The enlarged pump-room now measures 50 ft. by 35 ft. 9 in., and has two entrances,

one at each end of the building, each with vestibule 8 ft. square under one of the dome. The back portion has been raised to height of the main building, and the formerly walled off for the accommodation of pumping machinery has been added to pump-room.

Two brick piers carry steel girders for supporting the roof in place of the wall which has been taken down, the piers being in line with those built at the front.

In the space added at the back of the pump room is the new well chamber, 29 ft. long, 14 ft. wide, with serving landing and marble balustrade along the front.

The well in the middle of the new chamber is elliptical in plan, the major and minor axes measuring 6 ft. and 3 ft. 9 in. respectively. The well is 1 ft. 9 in. deep, the waters rising through perforations in the bottom of the basin. The outer shell is of cement moulded with blue bricks and finished in white statuary marble, the upper edge having moulded channelled coping.

At the left hand of the well chamber the chalybeate spring room, and at the right hand a room for the use of attendants.

These rooms are separated from the pump room by a mahogany partition and from well chamber by a low marble balustrade.

The interior of the remodelled pump-room has been decorated in appropriate and pleasing style, and Mr. Langley is to be congratulated on the successful manner in which alterations have been carried out.

Portland Cement and Slag.

HERR C. SCHNEIDER, in *Mitt. kgl. Materialprüfungsamt*, 1912, gives a comparison of the effects of pure sand and standard sand mixtures of Portland cement and slag. materials used for the tests were (1) Rüders Portland cement, (2) blast-furnace slag which had been heated to a red-heat, (3) ground pumice, (4) Freienwald sand. Nos. 2, 3, and 4 were all passed through a screen of sixty mesh per centimetre.

The tests were made from two different starting points, namely, as to the ratio of slag to Portland cement, the mixture, and as to the use of several such mixtures respectively of Freienwald sand designated in the Table II "Standard"; and of the ground pure designated pumice sand.

The mixtures were compounded in percentages by weight of Portland cement and blast furnace slag as Table I:

TABLE I.			
Distinguishing Letter.	Portland Cement.	Slag.	
a	100	0	
b	80	20	
c	70	30	
d	60	40	
e	20	80	

Using one volume of "mixture" to five volumes of standard sand or pumice sand, tests were made of each compounding, average results of which are given in Table II. It will there be seen that the pumice sand takes up much more water than the standard; that the crushing strength of the blocks best for the former in mixtures d and e; while in mixtures a, b, c, and especially in a, standard sand was best.

TABLE II.—FIRST SECTION SHOWS TESTS USING STANDARD SAND, SECOND SECTION USING PUMICE SAND.

Mixture.	Water Added, Per cent.	Average Volume—Weight in Grams per Cubic Centimetre, after			Average Crushing Strength Kilogrammes per Square Centimetre, after	
		1 Day.	28 Days.	90 Days.	28 Days.	90 Days.
a	7.5	2,248	2,279	2,287	425	470
b	8.0	2,087	2,158	2,283	243	248
c	9.0	2,050	2,132	2,141	153	180
d	10.0	2,020	2,096	2,104	100	128
e	11.0	1,520	1,597	2,014	18	26
a	28.0	1,651	1,710	1,727	261	303
b	29.0	1,561	1,654	1,673	174	219
c	30.5	1,527	1,611	1,648	144	179
d	32.0	1,496	1,561	1,614	102	189
e	34.0	1,397	1,497	1,549	27	31

THE BUILDING TRADE.

LONDON BUILDING UNDER MODERN LAWS.

THE present system, or rather no system, under which the London Building Act of 1894 is administered has frequently the effect of rendering occupiers of buildings liable to prosecution for acts of illegality committed in ignorance. Often has a building, on change of ownership, been put to uses not contemplated at the time of its erection, uses which contravene the Building Act in ways that are far from being obvious to the layman. In such cases, when the facts become known to the authorities, proceedings may be taken against persons who are morally innocent.

In order to see how such cases may arise and what precautions would prevent their arising, we briefly trace the usual process of Building Act administration in London from the commencement to the completion of a building. The builder serves upon the district surveyor notice of his intention to build. If the notice, taken by itself, discloses an intention to do anything contrary to regulations, the district surveyor has to serve upon the builder a notice of objection referring to such matter. Usually, however, such a case does not arise. But in any case there are numerous matters in every building which are not specified in a builder's notice, and which cannot, indeed, be understood without reference to plans. Plans, except in the case of a public building, are not required to be deposited with a district surveyor, and he, as a rule, peruses the plans officially, pointing out in advance anything which objection would have to be taken. He then surveys the work during its progress, and sees that it is carried out in accordance with the Act or Acts and by-laws which are applicable. Upon the completion of the work he withdraws, leaving behind no record of his labours other than the building itself. Subsequently the building may change hands. The new owner usually sees no reason for seeking an architect's advice as to the manner in which his building should be occupied, and he lets it in the most profitable way open to him, and possibly it is mislet, with the result that it is used for purposes not contemplated by the original architect, and frequently in contravention of building laws.

For example, a building intended to be used wholly or principally as offices or counting-rooms may be sufficiently lighted and ventilated, without having an open space at the rear of the form and extent required by sect. 41 of the Act. Upon change of ownership the entire upper portion of such a building might be converted into residential chambers, without hardship or injury to any of its occupants, yet the owner would become liable to heavy penalties. Then there are the rules applicable to habitable rooms. Concerning these it might be argued that surely any person should be competent to judge whether a room is or is not fit for habitation. But, referring to sect. 45, can a layman be expected to know when a window looking into an internal court must have, and when it need not have, a right-angle of 2 to 1 from its sill to the top of the opposite wall? Again, referring to sect. 70, few will understand why in one case a room must have a window equal in size to one-tenth of its floor area, while in another case a dormer of which the whole can be opened, equal in size to only one-twenty-fourth, is sufficient. A building originally intended to be used wholly for purposes of trade, or partly for trade and partly as offices, may, after changing hands, be used partly for trade and partly as a dwelling-house, without having the fire-resisting separations required by sect. 74 (2). In any of the above cases the rules as to the conversion of buildings under sect. 211 would be infringed, and the offending parties would become liable to a penalty of ten pounds "and to a daily penalty not exceeding the like amount."

Under the Metropolitan Building Act, 1855, the prevailing method of procedure worked

well, because that Act was free from complex rules affecting the uses of buildings. But the Act of 1894 introduced such rules without providing for the change of procedure which now appears needed. We need something akin to the provincial system, under which buildings are carried out in accordance with plans approved by a public authority, and the plans remain as a record of what has been officially sanctioned. As regards London, the tendency of legislation seems to be in the direction of an approximation to such a system. In the Act of 1894 many things are prohibited, except with the consent of the County Council; and under such consent works have to be carried out in accordance with approved plans. Under the London Building Acts (Amendment) Act, 1905, means of escape in case of fire are required in certain cases to be provided, according to plans and conditions approved by the Council. Possibly, in future amendments of the London Building Acts, the principle will be further extended. In the meantime architects and builders may do much to preserve owners of property from the pitfalls that beset their path.

If the builder's notice to the district surveyor were always accompanied with plans showing clearly the nature of the intended work and the uses of the building in its several parts, such plans being referred to in the notice, many sources of subsequent error would be removed. The district surveyor would be obliged to take official cognisance of the plans and to serve upon the builder a notice of objection in respect of any matter seen to be contrary to the regulations; and in the absence of any such notice the plans could be deemed to be officially approved. But, even without serving plans upon the district surveyor, it is always possible for the architect, on completion of the building, to furnish his client with a set of plans indicating the uses to which the building can lawfully be applied. On disposal of the building these plans could be handed over to the new owner, who would thus be apprised of the limits of user and would be guarded against the error of converting the uses of his building without the necessary structural alterations.

IMITATION STONE FLOORS.

"STEINHOLES" or "stone wood" forms a connecting-link between the elastic vegetable fibre materials, artificial or natural, the stone deriving its qualities more from the magnesite or from the vegetable fillers of which it is made, according to the relative proportions of the two components. It is not advisable, says a German writer, to swerve too far from the proportions of 40 per cent. magnesite to 60 per cent. fibrous vegetable filler in the dry mixture. A floor which is practical from every point of view is made from 50 litres of wood flour, 16.5 kg. heavy spar (barite), 8.35 kg. of asbestos, and 15 kg. of mineral colouring matter, together forming 60 per cent. of the compound. For mixing there is used a 22 per cent. solution of magnesium chloride in water, to which is added a solution of 460 grammes of neutral tallow soap and 240 grammes of silver soap in 20 litres of hot water. Before use there is added to this soap solution 1½ litres of alcohol, and then 7 to 8 litres of the magnesium chloride solution. By adding 4 kg. of acetic acid to the last-named solution there is obtained the requisite liquid mixture to be added to the dry compound.

By omitting the vegetable fillers there are obtained a species of cement, the most usual of Paris. There are no longer differences of opinion as to the best manner of preparing this mixture. The general opinion is that only the slow-setting plaster is practicable, as stucco plaster, when rendered slow-setting by special additions, never makes a good floor.

In preparing the gypsum mix, the same rule applies as in general in handling "plaster of Paris," namely not to pour the water on the latter, but to shake the powdered plaster lightly into the water, and then stir the result being the avoidance of lumps.

The somewhat thin mixture is applied by pouring and travelling smooth. After hardening has begun, but before the setting is completed, the floor is beaten hard with wooden blocks, which permit reduction of the thickness of the layer by one-fourth.

Very often this floor is used only as a basis for linoleum; in which case the use of fillers such as ground coke is permissible; indeed, coke can be used even where no linoleum is to cover the floor proper. Where the plaster is not concealed by linoleum or other covering it is well to use colouring matter with it, or by means of wooden forms to make therein sunken patterns which can be filled with mass of another colour than the ground.

Besides gypsum there may be used lime and clay. Both were used in older times, and indeed clay has been employed quite recently in the country for barn floors and the like, and has the advantage over cement that it yields a very much more elastic floor.

If cement is used instead of gypsum, broken marble may be embedded therein in regular patterns, the result being called torazzo. When the cement has hardened the surface is rubbed down smooth. For the lower layers there may be employed a beton consisting of one part of cement, three to four of sand, and eight of gravel. Or this layer may be made of one part of slacked lime, one to two of powdered brick, and three to four of broken brick. This floor is especially adapted for engine-rooms and the like, having the advantage over slab floors that sunken places for the machines may be left and bolt-holes easily provided for.

Such floors are also especially adapted for barn floors over which heavy wagons are driven. Here the lower layer may be of a well-tamped mixture of one part of cement, three of sand, six of gravel, and nine of broken stone. The upper layer, say 1½ in. thick, may be of two parts of cement and five of fine granite spalls. An especially firm and even surface may be obtained by rolling in a thin layer of fine cracked granite. Of course, no rubbing down is here necessary.

To obtain a more elastic floor the under layer may be of one to ten beton, with a ½ in. to 1 in. thick top layer of "cork plaster," this being composed of sawdust, cork refuse, magnesite, and magnesium chloride, spread on thin.

The reverse of this procedure is attained in Dresden by spreading a layer of nine parts of cork refuse, two of cement, and two of a felt-like mass stirred in water, and bedding the pieces of marble therein. This floor is said to be a good insulator of heat and sound and also very resistant to wear.

ARTIFICIAL MARBLE FROM LIMESTONE.

A new process of making artificial marble is being practically employed by a Hessian firm. Whereas formerly the so-called artificial marbles imitated the natural only in appearance (as, for instance, in colour), veining, and polish, the present method makes use of a substance chemically and physically as near as possible to marble, namely, hard limestone, being an uncrystallised lime carbonate, whereas marble is the same material, only in crystallised form. The old-fashioned artificial marbles were usually made of powdered stone, sand, and a bond—usually lime or cement, or a mixture of these.

According to the new process, calcined limestone, such as is used for making lime mortar, is artificially retransformed into lime carbonate, and then artificially coloured to produce the desired patterned or veined effect. The calcined lime is subjected to the action of carbonic acid gas at about 110 deg. C., at which temperature a chemical combination takes place. No pressure is employed. The necessary carbonic acid gas is obtained from lime-kilns, breweries, or other cheap and plentiful sources. The only special precaution

necessary is to avoid the presence of watery vapour in the gas. The temperature should vary with the porosity of the material and the proportion of lime hydrate which it contains. The less porous the mass and the coarser the particles the higher the temperature necessary, but 110 deg. C. is seldom exceeded, as above this the action of the gas is diminished by the drying effect. The resultant mass is sawed into slabs and polished, just like natural stone; but the price (in Hesse) is only about one-half that of the latter, and, of course, even although a natural marble is at hand and available for use, the process has the advantage of delivering any desired colour or veining.

COST PRICES OF STUCCO WITH THE CEMENT GUN.

In previous issues we have described and referred to the uses of the so-called cement "gun," an appliance which is finding considerable employment both in America and on the Continent.

Therefore our readers will probably be interested in the subjoined data on the actual cost of work executed on the exterior of a two-story building constructed for the United States War Department.

The figures are given on the authority of Mr. R. C. Hardman, Superintendent of Construction in the Department, but for convenient reference we have converted the various prices to English currency.

The exterior of the building comprised 631 sq. yds. of surface, and fifty-six door and window openings, the cost items being as follows:—

	Cost.	Cost per sq. yd.
LATHING (Materials) —		
Cheese cloth, 631 sq. yds.	4 8 0	
Building paper, 568 sq. yds.	3 8 2	
Wire, 631 sq. yds.	16 2 7	
1 in. x 5/8 in. sq. yds.	0 10 7	
Nails, 10 lb.	0 1 8	
Staples, 250 lb.	1 13 0	
	26 5 0	0 10
LATHING (Labour) —		
Carpenters, 75 hours	7 14 0	
Carpenters' labourers, 144 hours	10 16 0	
Labourers, 33 hours	1 9 0	
Labourers (Mexican), 414 hrs.	1 6 0	
	21 5 0	0 8
Total for lathing.....	47 10 0	1 6
PLASTERING (Materials) —		
Portland cement, 65 barrels	44 11 10	
Sand (on site)	—	
	44 11 10	1 5
PLASTERING (Labour) —		
Nozzlemans, 98 hours	10 16 0	
Engineer, 100 hours	7 10 0	
Labourers (mixing), 212 hrs.	6 12 6	
Labourers (on wall), 156 hrs.	5 4 0	
Labourer (loose), 58 hours	2 11 9	
	32 14 3	1 04
FUEL —		
Gasoline, 97.5 gallons	4 5 10	
Lubricants	0 19 7	
	5 5 5	0 2
Total for plastering	62 11 6	2 71
Total cost	130 1 6	4 11

The time occupied in executing the work was twelve days. Although the total cost per square yard may appear to be somewhat high, it must be borne in mind that the stucco was at least 1½ in. thick, and that the building was not a particularly favourable one for the employment of the apparatus.

THE INSURANCE ACT.

The decisions given by the umpire under the Insurance Act, and reported in the *Labour Gazette*, now number over 1,000, and only such decisions are reported as lay down some principle or affect a class. This method of deciding the effect of legislation is without precedent, and it is to be hoped will not in itself create a precedent. To classify these 1,000 odd decisions is an impossible task, except for the expert, and laymen cannot be expected to know what workmen they are under liability to insure, yet a penalty may be imposed if the provisions of the Act are not complied with. Unemployed insurance was admittedly only introduced as an experiment, and it was understood that it

would be confined to a limited number of specified trades. A perusal of the decisions will show that this view of Part II. of the Act was erroneous, and that in practice there is far greater difficulty in determining who are insured persons under this part of the Act than under Part I.

At the risk of repeating ourselves, we must again point out that all this uncertainty and difficulty has been occasioned by subsect. 2 of sect. 107, which provides that in determining whether a trade is or is not an insured trade regard shall be had to the nature of the work in which the workman is engaged rather than to the business of the employer by whom he is employed. This provision was wholly incompatible with the idea of a limited experiment, and accounts for the numberless questions which are being submitted to the umpire for decision, and it should be repealed at the earliest possible opportunity. If the sixth schedule of the Act which specifies the trades to which Part II. of the Act was to apply be compared with the decisions now given by the umpire, it becomes apparent how very different in practice is the application of unemployed insurance from what it was announced to be when it was introduced, and how impossible it is for any employer to know whether his workmen are within this part of the Act or not. Where penalties are imposed the Legislature has always hitherto been careful to see that Acts of Parliament are specific and expressed in clear terms, so that the public should know whether they are complying with the law or are committing an offence by contravening it, but Part II. of the Insurance Act has already to be read in connexion with 1,000 decisions, and each day is adding to their number. We believe that no prosecution has been instituted at present under this part of the Act, and it remains to be seen how far these decisions of the umpire are binding or form part of the Act.

TRADE UNIONS AS EMPLOYERS.

THE Press is making merry over the dispute between the Amalgamated Society of Railway Servants and its clerical staff, and a trade union experiencing "peaceful persuasion" and picketing it must be confessed has its humorous side. All the same if the allegations are true that the men on strike have had their benefits confiscated and that new men are being compelled, when engaged, in contravention of the Insurance Act to join the union as an approved society, this is a serious matter. At the Trade Union Congress indignation was expressed because it was alleged that employers were exerting pressure to compel their employees to join certain societies, and it is to be hoped that this union is wrongly credited with having adopted any such course in regard to its own servants. The oratorical thunder that is rolled forth against employers in their relations towards their employees will, however, be discounted by the men in future if they find that the Trade Unions as employers consider it their duty to confiscate benefits and to compel men to join the unions as approved societies. With the militant attitude adopted by the unions and with the extraordinary powers conferred upon them we have never felt that they should have been created approved societies under the Insurance Act.

PRACTICAL TRAINING OF GASFIITERS.

THE Gas Light and Coke Company have just put into operation their scheme for the practical training of gasfitters. They give the necessary instruction in workshops upon their premises, and the London County Council will provide courses at the Westminster Technical Institute to extend over two years, in mechanical drawing, workshop arithmetic, composition, and précis. The boys, after passing six months in the shops, will go out with fully-trained fitters, whilst continuing to attend the Institute classes thrice a week. During the course the boys will receive 2s. 6d. wages in the first year and a maximum of 10s. in the second year; they will, it is anticipated, then earn from 3s. to 4s. as gasfitters' mates, and possibly from 4s. 6d. to 6s. a day. The boys must be fourteen and not more than sixteen years old when they take up the course, and possess some mechanical aptitude, together with an elementary school Standard VII. proficiency.

GENERAL BUILDING NEWS.

NEW CLOCK, MAULDEN CHURCH.

A large clock has just been erected at Maulden Church tower, Bedfordshire. It shows time on one large dial, plays the minister quarter chimes, and strikes the hour. The work has been carried out by Mr. John Smith & Sons, Midland Clock Works, Derby, who recently erected a similar clock at Silsoe Church in the same neighbourhood.

BRIGHTON AND HOVE HIGH SCHOOL FOR GIRLS.

The alterations and improvements which have been carried out at this school are complete, and the increased accommodation provides for 300 girls. The architects for the work were Messrs. Osborne Smith & W. House, of London, and the work was executed by Messrs. Field & Cox, of Brighton.

COUNTY SCHOOL AT HYDE.

New school buildings in Clarendon-road, Hyde, built for the Cheshire County Council, were opened on the 17th inst. The site of the building is on the side of a hill facing the town, and is somewhat irregular. The design of the school has been arranged so as to utilise the site to the best possible advantage. The school is set well back from the roadway and is approached by a carriage drive. The style of architecture adopted is a free treatment of "Georgian" materials, used being red stock brick facings with biscuit-coloured terra-cotta details of varying shades, and roofed with sea-green Westmorland slate. The building heated throughout with low-pressure hot water supplemented by open fireplaces was necessary; adequate ventilation also has been provided. The general contractors were Messrs. Samuel Robinson & Sons, of Huddersfield, who, with their sub-contractors, have factorily carried out the work from the design and under the supervision of the architect, Mr. G. H. Willoughby, F.R.I.B.A., of Manchester. Mr. E. Feneleau acted as clerk of works.

MOROCCO, CASABLANCA.

H.M. Consul at Casablanca (Mr. A. Madden, C.M.G.) reports that this year large and profitable import and export trade is being done. The great extension of business operations in and around the town of Casablanca has been a marked feature of the year and in consequence there has been a large import trade in all kinds of building material.

COMMERCIAL FAILURES.

According to *Kemp's Mercantile Gazette*, the total number of commercial failures recorded in England and Wales during the week ending Friday, September 29, was 112. The number the building and timber trades contributed thirteen, a high proportion.

TRADE NEWS.

Under the direction of Mr. Charles J. M. Inst. C.E., Borough Engineer, R. Boyle's latest patent "air-pump" ventilator and air-inlets have been applied to the Council House, Town Hall, Basing.

The Improved Wood Pavement Company, Ltd., 46, Queen Victoria-street, E.C., find that this has been a record year for creosoted paving. On their list of contracts are the names of many of the principal authorities in London and the provinces.

Messrs. Patman & Fotheringham, Ltd., 100 and 102, Theobalds-road, W.C., and P. Street, Islington, N., have received the painting and redecorating contract at Sessions House, Clerkenwell.

The Eastleigh and Bishopstoke Island Hospital is being supplied with Shorland patent exhaust roof ventilators by Messrs. E. H. Shorland & Brother, Ltd., of Farnworth, Manchester.

PORTLAND STONE AND ITS WEATHERING.

Dr. J. S. Owens read a paper to the British Association upon "Experiments on the Weathering of Portland Stone." Dr. Owens referred to the investigations conducted by the Coal Smoke Abatement Society, with the object of finding the connexion between smoke and the adverse sulphating of exposed stone that contain a large element of calcium magnesium carbonate. The stones are in course of being treated during periods ranging from 105 to 687 days in various conditions, namely: (a) broken without exposure; (b) broken after exposure to natural influences out of doors in London and the country; (c) broken after having been kept indoors in London and the country; and (d) broken after having been exposed, whilst embedded in soot, to air in the country and London.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Alterations at city hospital; Mr. J. Rust, Architect, Burgh Hall, Aberdeen.

ASHBY-DE-LA-ZOUCH.—Additions at Castle Lodge, South-street; Messrs. Orton & Sons, builders, Kilwardby-street, Ashby.

AVONBANK.—Messrooms at electricity works (2,671); Messrs. J. Perkins & Son, builders, 2, Lower Redland-road, Bristol.

BELFAST.—Additions to offices of Water Commissioners (1,097*l.*); Mr. S. Stevenson, architect, 83, Royal-avenue, Belfast; Messrs. J. & W. Stewart, builders, Ormeau-road, Belfast.

BISHOP AUCKLAND.—Baths; Mr. T. Collins, Surveyor, Urban District Council Offices, Bishop Auckland.

BLACKBURN.—Hall (20,000*l.*) for the Bolton Wesleyan Synod.

BLITH.—Proposed Town Hall (10,000*l.*); Mr. Robert Grieves, Surveyor, Urban District Council Offices, Blith.

BOGNOR.—Sixty-four houses; Mr. O. A. Bridges, Surveyor, Urban District Council Offices, Bognor.

BOURNEMOUTH.—Additions to club, Goldenhurst-road; Secretary, East Conservative Club, Goldenhurst-road, Bournemouth. Additions to the Endowed High School for Girls, Norwich-avenue, for the Managers.

BRADFORD.—Proposed branch library, corner of Undercliffe-street and Tennyson-place, and open-air baths, Fairweather Green; Mr. Reginald G. Kirby, Architect, Town Hall, Bradford.

BRIDGINGTON.—Club at People's Palace for the Secretary of the Bridlington and District Conservative Club.

BURY.—Nurses' home; Messrs. Thompson & Brierley, builders, Boundary-street, Bury.

CARDIFF.—Mobilisation store (1,194*l.*); Mr. J. Stephens, builder, Cardiff.

CARLISLE.—Post-office, Warwick-road; H.M. Office of Works, Storey's-gate, Westminster, S.W.

CARNARVONSHIRE.—Wireless telegraph receiving and transmitting stations; Marconi's Wireless Telegraph Company, Ltd., Marconi House, Strand, W.C.

CATHCART.—School, Craig-road, for the Cathcart School Board.

CIRENCESTER.—Enlargement of hospital (2,000*l.*); Mr. H. Fleetwood, builder, South Cerney, Cirencester.

COTtingham.—Tuberculosis hospital (15,000*l.*); Mr. J. H. Hart, Architect, Town Hall, Hull.

CROMPTON.—Extensions to Diamond Mill for Messrs. Hardman, Ingham, & Dawson, rope and twine manufacturers.

CREWE.—Alterations to premises for Woolf's Brewery Company, Ltd.

CROYDON.—Offices at Gas works; Messrs. Berney & Son, architects, 104, George-street, Croydon; Mr. D. W. Barker, builder, Church-road, Croydon.

DUNFERMLINE.—Alterations and additions to workhouse (550*l.*); Mr. T. Knight, builder, Craybrooke House, Sidecup-hill, Sidecup, Kent.

DARWEN.—Extensions to warehouse for the Greenfield Mill Company, cotton goods manufacturers.

DEWSBURY.—Additions at workhouse (505*l.*); Mr. J. Pease, Clerk, Guardians' Offices, Dewsbury.

DUMBERTON.—Additions to slaughterhouse (1,300*l.*); Mr. J. Briggs, Surveyor, Burgh Hall, Dumfries.

DUNFERMLINE.—Workshops, Castlehall Park, for Mr. John Rintoul, general dealer, Jig Burn House, Dunfermline; rebuilding Castlehall Linen Factory for Messrs. John Inglis & Co., Victoria Works, Grantsbank-street, Dunfermline.

FALMOUTH.—Twenty-two houses; Mr. H. W. Tressider, Surveyor, Town Hall, Falmouth.

GAINSBOROUGH.—Extensions to baths, Lea-road (1,450*l.*); Mr. J. G. Cooling, builder, Roperoy-road, Gainsborough.

GLASGOW.—Warehouse buildings for Glasgow and South-Western Railway Company; Mr. H. E. Clifford, architect, 225, St. Vincent-street, Glasgow.

GLASGOW.—Picture theatre, Sauchiehall-street (2,000*l.*); Mr. A. V. Gardner, architect, 164, Bath-street, Glasgow.

GLASGOW.—Headquarters, Cranage Lodge; Messrs. G. Arthur & Son, 85, Bath-street, Glasgow.

GLASGOW.—Cold storage warehouse, Hill-street; Messrs. J. W. & J. Laird, architects, 163, Hope-street, Glasgow.

GLASGOW.—Episcopal church and hall, Mile End; Mr. H. D. Watson, architect, 213, West Campbell-street, Glasgow.

HALL.—238, New City-road, for Miss E. Taylor, 182, Saracen-street, Postpark, Glasgow; alterations and additions to buildings at the Stobhill Hospital for the Glasgow Parish Council; alterations to premises for Messrs. W. P. Lowrie & Co., Ltd., bonded

warehousemen, 44, Washington-street, Glasgow; additions at works, Parkhead, for Messrs. William Beardmore & Co., Ltd., steel manufacturers.

GREENOCK.—Two hundred houses; Mr. A. J. Turnbull, Master of Works, Burgh Hall, Greenock.

HALIFAX.—Barracks for the Halifax Battery of the 2nd West Riding Brigade, H.M. War Office, Whitehall, S.W.

HAMPTON.—Cottage hospital (3,850*l.*); Mr. F. G. Hughes, architect, Ashley-road, Hampton; Mr. E. D. Hobbs, builder, Angel-road, Thames Ditton.

HASTINGS.—Proposed band enclosure near pier (13,000*l.*) and extensions at waterworks (50,000*l.*); Mr. P. H. Palmer, Surveyor, Town Hall, Hastings.

HEATHFIELD.—Diphtheria block at hospital (2,700*l.*); Mr. J. Young, Surveyor, Town Hall, Ayr.

HOVEWOOD.—Picture palace, Market-street, for the Hoveywood Picture Palace Company, Ltd.; Mr. G. E. Tonge, architect, 408, Lord-street, Southampton.

HUTHWAITE.—Library (2,098*l.*); Messrs. Valance & Blyth, builders, Duke-street, Mansfield.

INCE.—Offices for the Ince Wagon and Iron-works Company, Ltd., Lower Ince.

IPSWICH.—Memorial hall, Bolton-lane (1,968*l.*); Messrs. E. Catchpole & Sons, builders, 177 and 179, Princes-street, West, Belfast.

JARROW.—Convenience, Nixon-street; Messrs. Chorlton & Thompson, builders, Back Queen's-road, Jarrow.

KETERING.—School, Clover-hill (2,450*l.*); Messrs. Cooper & Williams, architects, 15, Market-place, Kettering; Messrs. Smith & Bunning, builders, Lancaster-road, Kettering.

KINGSTON-ON-THAMES.—Rebuilding "Three Tuns" Public-house, London-road, for the Isleworth Brewery Company, Ltd., St. John's road, Isleworth.

KIRKCALDY.—Extensions to generating station (2,195*l.*); Messrs. Smith & Son, builders, Kirkcaldy.

LAMBOURN.—Workmen's dwellings (380*l.*); Mr. G. Elms, builder, Stockcross, Newbury.

LANCHESTER.—Completion of two houses, Ormsley-hill (430*l.*); Mr. F. A. Coyle, architect, Front-street, Consett; Mr. F. Ward, builder, Anfield-plain.

LARNE.—Gardenmore Presbyterian Church, Victoria-street; Messrs. Hobert & Heron, architects, 7, Donegall-square West, Belfast.

LEIGH (LANCS).—Sunday-school (940*l.*); Mr. C. Simpson, architect, Bank-chambers, Railway-road, Leigh; Mr. J. Boydell, builder, Princess-street, Leigh.

LEIGH-ON-SEA.—Office, etc., at Gasworks (500*l.*); Mr. J. J. Galer, builder, Fairleigh-drive.

LENNOX.—Bakery and stables for Co-operative Society (4,000*l.*); Messrs. Boston, Menzies, & Morton, architects, 11, William-street, Greenock.

LINSLADE.—Alterations to St. Barnabas' Church; Mr. T. Yirrell, builder, Leighton-road, Linslade.

LINTHWAITE.—Additions to premises, Hoyle-house; Secretary, Hoylehouse Liberal Club, Lintshaw.

LISAWRYGLYN.—Alterations to school (560*l.*); Messrs. Jones & Sons, builders, Llanddilos.

MACLESFIELD.—Co-operative premises; Mr. Jabez Wright, architect, 27, King Edward-street, Macclesfield.

MAIDENHEAD.—Shops and business premises, Queen-street; Mr. H. Stanton-Webber, architect, 23, Queen-street, Maidenhead.

MEITHAM.—Additions at Spink Mire Mills for Messrs. Quarby & Sykes, Ltd., rag merchants.

MORPETH.—Workmen's dwellings (5,855*l.*); Mr. G. Douglas, builder, Newcastle.

NEWTON MEARNS.—Additions to school for the Mearns Parish School Board.

NORTHWICH.—Rebuilding constitutional club and new offices, Witton-street (1,655*l.*); Mr. J. Cawley, architect, Bull Ring, Northwich; Mr. C. W. Bostock, builder, London-road, Northwich.

WORKMEN'S DWELLINGS FOR MESSRS. BRUNNER, MOND, & CO., CHEMICAL MANUFACTURERS, WINNINGTON, NORTHWICH.

PEASEDOWN.—St. John (Somerset)—Three houses (575*l.*); Mr. W. F. Bird, architect, The Island, Midsomer Norton; Mr. W. J. Heal, builder, High Littleton.

PENDLEBURY.—Alterations and additions to offices, Bolton-road, for the Worsley Brewery Company, Ltd.

PERSHORE.—Cottage homes (1,200*l.*); Mr. A. E. Baker, Clerk, Guardians' Offices, Pershore.

POOLE.—Plans have been passed as follows:—Five houses, Hill-road, for Mr. C. H. Goater, on behalf of Mr. J. Lawford; three houses, Buckingham-road, for Mr. A. E. Hoare on behalf of Mr. T. Hopcroft; alterations to laundry, Norris-road, for Mr. W. J. Williams; eight houses, Wallis Down, for Mr. H. Kendall on behalf of Mr. D. G. Hewett.

PORTSMOUTH.—Boiler house, cold store, etc. (1,712*l.*); Messrs. Wallis & Sons, Ltd., builders, Broadmead Works, Maidstone.

RADOLIFFE.—Alterations and additions to technical school (7,540*l.*); Messrs. F. M. & A. Nuttall, builders, Whitefield.

READ (NEAR BLACKBURN).—Additions to mill for Messrs. J. Kemp & Brothers, Ltd., cotton goods manufacturers, 4, Chapel-walks, Manchester.

SHIPLEY.—Engineering works, Hirst-lane, for Messrs. Wigglesworth & Co., Ltd., Moss-street, Bradford.

SOUTHAMPTON.—Alterations and additions to Portwood Car Depot (879*l.*); Mr. J. Douglas, builder, Southampton. The following plans have been passed:—Additions to Eye Hospital, Bedford-place, for Messrs. Udall & Co.; six houses, St. Andrew-road, for Messrs. Weston & Burnett; seven houses, Norfolk-road, for Messrs. Jurd & Sanders; alterations and additions to the Gordon Arms, Portwood-road, for Mr. A. A. Barnett; additions, Bridge Foundry, Northam, for Messrs. G. P. Wilson & Sons. Plans have been lodged for four houses off Highfield-lane by Mr. W. F. Perkins; and for eighteen houses, Shirley-avenue and Wilton-road, by Mr. J. Smith.

SWANSEA.—Proposed hospital; Mr. Marcus Hoskins, Estate Agent, Town Hall, Swansea. Proposed buildings, Castle-street, for the Prudential Assurance Company, Ltd., Holborn Bars, E.C. The following plans have been passed:—Buildings, 3 and 4, Cambrian-place, for Messrs. Harries Brothers; buildings, 12, Castle-street, for Mr. Williams; four houses, Eaton-crescent, for Mr. W. H. Harding; additions to Glyn Vivian Mission Hall, Pentremawr-road, for the Trustees; three houses and bakehouse, Langland-street, for Mr. Richard Lacey; alterations, Empire Theatre, Oxford-street, for Messrs. Moss, Ltd.; cinema hall and shop, St. Helen's-road, for Messrs. C. H. Behenna & Co.

SWANWICK.—Drill hall (730*l.*); Mr. H. A. F. Smith, architect, Star-chambers, High-street, Gosport; Mr. G. Hackett, builder, Look's Heath, Swanwick.

WALLSEND.—Alterations to store, Frank-street, for the Industrial Co-operative Society; Mr. John A. M. Henderson, builder, Hebburn.

WALSALL.—The following plans have been passed:—Ten houses, Sneyd-lane, Bloxwich, for Mr. D. E. Parry; alterations and additions to premises, Park-street, for Messrs. E. T. Holden & Son; extensions to electric theatre, High-street, Bloxwich, for Mrs. Mountjoy; additions to shopping, Wolverhampton-street, for Messrs. J. Bailey & Co. A plan has been lodged for the erection of a warehouse, Greenlane, Leamore, by the Talbot-Stead Tube Company, Ltd.

WEST PENNARD.—Restoration of church; Messrs. Merrick & Sons, builders, Silver-street, Glastonbury.

WYCOMBE.—Bakery, stables, etc., Holly-road, for the Weymouth and District Co-operative Society.

WINDSOR.—Additions to premises, King's-road, for Messrs. Harrods, Ltd., Brompton-road, S.W. Additions to premises, Alma-road; Mr. E. Bamfylde, builder, 23, France-road, Windsor.

WITHNELL.—Offices for Messrs. Wiggins, Teape, & Co., Ltd., paper manufacturers, Chafford Mill, near Tunbridge.

WORTHING.—Pavilion and arcade at shore end of pier (3,261*l.*); Mr. F. Grace, builder, Southampton.

ECOTON CHURCH, NORTHAMPTON.

The east window erected in the above church in memory of the late Major-General Sotheby was designed and executed by Messrs. Percy Bacon & Brothers, of London. The work was supervised by Mr. E. de W. Holding, architect, of Northampton.

THE FIRE IN ST. PANCRAS.

We read that by the provision of the architect—who, we may state, was Mr. Keith D. Young, F.R.I.B.A.—the spreading of the flames from Mr. W. Burden's timber-yard, in the night of September 17, to the adjacent vast pile of St. Pancras municipal dwellings, known as Goldington-buildings, was arrested by the brick screen wall, with buttresses, which he required to be erected to the height of the timber store.

LONDON ASSOCIATION OF MASTER DECORATORS.

A meeting of the Executive Committee of the above Association was held at 52, Queen Victoria street, E.C., on September 9. Mr. T. S. Rowden occupied the chair, and there were also present:—Messrs. J. Anderson, J. H. Campbell, H. J. Honeychurch, Charles Saul, and A. Davidson (Secretary). The General Committee meeting is to be held on October 14 next, at 6.30 p.m., and the annual dinner on Thursday, October 17, at 7.30 p.m.

SOUTH ELEVATION

SECTION A

1 to 2

School for Boys and Girls, Ripley, Derbyshire.

Mr. G. H. Widdows, A.R.I.B.A., Architect.

NEW SCHOOL AT RIPLEY, DERBYSHIRE.

This school, which is to be erected at Ripley, Derbyshire, will accommodate about 1,200 children, and marks the latest developments in school planning in this county.

Hitherto it has been the custom to divide children into three groups—boys, girls, and infants. In this case the old grouping is done away with, and in place thereof the children are arranged as juniors and seniors. There will thus be two junior schools, one for boys and one for girls from five years of age up to nine; and there will be two senior schools for boys and girls from about nine years of age until the finish of their school life. By this means the departments are limited to 300 children, which is about the maximum that a head-teacher can supervise satisfactorily if the individuality of the child is to be considered.

Each department will accommodate 302 children, and, though the classes are large, there appears to be no alternative at the present day, owing to the dearth of teachers and the general cost of education. When smaller classes become the rule it will mean that children will have 12 sq. ft. per child instead of 10 sq. ft.

All the rooms are provided with direct through ventilation, all the corridors being open to admit of this. Continued experience tends towards the conviction that the only satisfactory way of ventilating a classroom is by means of windows on two opposite sides, communicating directly with the outside air. When this is the case rooms can be efficiently ventilated by means of hoppers only. Experiments have shown that with a breeze as light as 4 miles per hour the air can be changed by hoppers only ten times per hour. The courts which are necessary to arrange for this ventilation can be used for open-air instruction when the weather permits.

The halls, cookery-room, and workshop are also planned for through ventilation. One hall will be available for junior and senior boys, and the other for junior and senior girls; and halls, cookery-room, and workshop can all be made

reserved so that a science laboratory can be erected there in the future. The average cost of schools in Derbyshire is 11l. 7s. per head and it is not expected that the amount will exceed in this case.

School for Boys and Girls, Ripley, Derbyshire.

Mr. G. H. Widdows, A.R.I.B.A., Architect.

into one apartment by throwing back the movable partitions which divide them.

The schools will be heated by low-pressure hot water calculated at 30 sq. ft. per 1,000 cubic ft. of contents. The open court to the south of the hall and adjoining the platform has been

CITY HALL, HULL.

The Hall, which occupies one of the best sites in the city, forms part of a block of building, comprising the concert hall, capable of seating 3,000 persons, reception, crush, and retiring rooms, an art gallery, and twenty-seven shops. The main entrance abuts upon the west side of Victoria-square, and the other three sides of the block are bounded by important business streets. The work has occupied a considerable period, as it has been necessary to carry out the scheme piecemeal in order to avoid the disturbing of existing tenancies. The total cost of the building has been something like 100,000l. The work has been carried out under the supervision of the City Architect Mr. Joseph H. Hirst.

COUNTY COUNCIL ART SCHOOL AND TECHNICAL INSTITUTES.

DURING the past week exhibitions of student work have been held by the Central School of Arts and Crafts, Southampton-row, W.C., the Camden School of Art, Dalmeny-avenue, Camden-road, N., and the Paddington Technical Institute, Saltram-crescent, W. The order in which we have mentioned these three schools is one of convenience only; those who have visited each exhibition will probably have no difficulty in assigning to them their right positions in the ascending scale of comparison. The art activities of the Central School are legion, and it is not surprising that here and there some quite incompetent work is shown. Speaking generally, however, the work maintains a tolerable level of achievement, and occasionally brilliantly above mediocrity.

School for Boys and Girls, Ripley, Derbyshire.

Mr. G. H. Widdows, A.R.I.B.A., Architect.

Architecture is poorly represented; as the work mostly done away and brought to the school criticism, it is practically impossible to select really representative drawings for exhibition. The stained-glass shown is fairly good, but the function of the leading in the completed picture has been in some instances perfectly appreciated, with the result that in some cases an otherwise well conceived figure of angel appears to be throttled by the leading. There is an excellently-studied shield, copied from wall-plate at St. George's Chapel, Windsor, but the cabinet class has turned out some good, if not original, work; a recessed corner-cupboard, covered with satin-wood, by Mr. A. T. Henderson is a soundly-constructed and capably-finished piece of furniture deserving of all praise. The art metal-work, shown by the Day Technical School, indicates talent of a high order; the appearance of the copper and silver vessels, most of which are of excellent design,

is, however, marred by the absurd affectation of leaving the hammer-marks on the surface—a spelling of Art with a capital "A" which cannot serve any useful end. Quite surprising ability, considering the age of the students, is manifested in the examples of die-sinking shown, and the Joan of Arc plaque, taken from the design of Boutet de Monvel, is particularly worthy of remark. The specimens of heraldic engraving exhibited suggest that the class would do well to turn for inspiration to the XVth century, when heraldry was yet a living art. The illuminating and lettering is a case of "crambe repetita"; the influence of the teacher, excellent in itself, represses all individuality, and in some cases, notably in the illuminated Litany, there is a total absence of congruity. Etching and mezzotint are well represented, and exceptionally good work is shown by Mr. H. Nelson in his little study of a London garret, and by Mr. George Rose in his composition entitled "The Elm Screen."

Wood engraving is so hopelessly dead that it would be well not to attempt its revival; if it is ever to compete with the process-block technique, as well as design, will have to be learned. Miss Ethel Lyne's embroidery is extremely pleasing both in colour and conception: her fire-screen, with its ably conventionalised finches and yew, may be noted. A burse, with the shields of the four English Saints, by Miss O. A. Noble, and a lectern-frontal, by Miss E. M. Lester, with the shield of All Saints, taken from Mr. Doring's manual on the heraldry of the church, are also noteworthy pieces of embroidery. Mr. L. Jacobs' studies from the moving model are very clever, and generally the studies from the life are entirely competent.

The exhibition of the Camden School of Art, though less catholic in its scope, shows great thoroughness in the work of its students. In modelling and drawing from the life, always a strong point of the school, the work of Mr. Sydney Greaves and Miss D. V. Clarke is of the

The City Hall, Hull: Sketch of the Interior.

Mr. Joseph H. Hirst, Architect.

first rank. The sound methods of teaching which have enabled them to attain their mastery of the structure of the human form are well illustrated by the brilliant anatomical studies of Mr. J. L. Barker and Miss D. A. Baines. A beautiful measured drawing of the pupil in St. Mary Abchurch, by Mr. E. H. Llewellyn, affords a strong contrast to the wretched design for a capital modelled by the same student, who would do well to seek his inspiration from the work he can portray so capably. Some clever animal studies are shown by Miss Lapthorne, whose designs for colour-prints are also excellent. Miss Tuck's design for an embroidered fire-screen shows the good use to which she has put her careful and accurate plant-studies.

The talent displayed by many of the students of the Paddington Technical Institute is astonishing. There are few architects' assistants who would not be proud of such work as Mr. H. G. L. Krüger's design for a carved and panelled room, which evidences remarkable powers of draughtsmanship, coupled with a sound grasp of style. For sheer brilliance it would be hard to surpass Mr. Smith's design for the decoration of a hall and vestibule. The painting and decorating class have carried into practical execution upon the wall of their classroom a carefully-conceived scheme of decoration; upon the frieze is this inscription:—"Truth is never learned in any department of industry by arguing, but by working"—a precept which might well stand for the motto of the school. Carving in stone and wood, metal-working, and cabinet-making all reach a high degree of excellence, and testify to the ability of the teaching staff in developing the best instincts of the practical craftsmen with whom they have to deal.

Some idea of the quality of the best work produced by the students of the schools under notice in every branch of the arts and crafts may be gained from the foregoing paragraphs; a word may now be said as to the facilities for instruction afforded to the architectural student. The school of architecture and the building crafts at the Central School holds classes every evening in the week during the session, which commenced here, as in the case of the other County Council schools, on Monday last. On Wednesday evenings a course of lectures on "The Growth of a House" is given, and on Saturdays there is a museum class at South Kensington. This latter, which was started last session, was attended also by sculptors, plasterers, mural painters, and general designers. The masters of the school are all practising architects. It will not be out of place here to draw attention to the prospectus and tiny table for the current session of the Westminster Technical Institute, Vincent-square, where excellent evening-classes in architecture and construction are held, one evening in the week being devoted to reinforced concrete design.

LONDON COUNCILS.

Barking.—Tenders are to be invited for sewerage of the road north of the Ripple School; also for making up same and the road on the west side of the school. The tender of Mr. W. E. Sharpless has been accepted for the erection of twenty-eight houses at 171s. each. The Surveyor has been instructed to prepare plans and estimates for carrying out street works, etc., in connexion with the above buildings. Plans have been passed for the erection of a factory for the Cape Asbestos Company, Ltd. Messrs. Lawes Chemical Manure Company, Ltd., have lodged plans for the erection of a Glover tower at Creekmoor.

Battersea.—Repairs are to be carried out to the carriageways and footways in four roads at an estimated cost of 622. Electricity mains are to be altered at an approximate cost of 480.

Berkhamsted.—Plans have been passed for additional buildings at Lower Chemical Works and for alterations to Nos. 80 to 86, High-street, for Messrs. William Cooper & Nephews; as have also plans for Messrs. Ayres & Farn for three houses at Gosson's-end.

Bushey.—The tenders of Messrs. W. Bailey & Sons, at 1,579s. and 690s., have been accepted for making up part of Grange-road and Nightingale-road.

Camberwell.—Pickwick-road is to be made up and paved as a new street. Plans have been lodged with the London County Council by Mr. W. C. Symes for the erection of a building on the site of Nos. 11 and 13, Sliyan-grove.

Deptford. A plan has been passed for Messrs. W. Cubitt & Co. for additions to Messrs. Scott's factory in Gosport-street.

East Ham.—Sanction has been received from the Local Government Board to the borrowing of £6,223s. for the erection of a fire-station and firemen's dwellings. The following plans have been passed: Mr. W. Cooper, five houses, Dersingham-avenue, and factory, Shaftesbury-road; Messrs. Clemens Brothers, two warehouses, Abbots-road; Mr. J. Smith, seven houses, Mafeking-avenue; Mr. J. Hurst, three houses, Mafeking-avenue; Mr. J. Clark, eight houses, Mafeking-avenue. Plans have been lodged by Mr. W. Harris for five houses, Station-street, North Woolwich; also by Mr. W. Stewart, for alterations to the "Albion" beerhouse, 104, Albert-road, North Woolwich.

Fulham.—The tender of Messrs. H. Windsor & Co. has been accepted at 18s. for carrying out alterations and repairs to the economiser buildings at the Electricity Works.

Hackney.—The tenders of the Strand Building Company have been accepted, at 1,151s. and 13,657s., for the construction of an underground convenience in Kingsland-road, and for carrying out extensions to the electricity generating-station. Various repair works are to be carried out at an estimated cost of 1,240s. Plans have been passed for Mr. M. Miller for the erection of a warehouse in Miller's-avenue, Stoke Newington, as have also plans lodged by Messrs. S. Haywood & Sons for the erection of four houses in Holly-street, Dalston.

Hammersmith.—The outer 18-in. margins of the London United Tramways Company's track in a portion of Uxbridge-road (approximately 2,000 yds.) are to be repaved with wood at 8s. 2d. per super yard. The Borough Surveyor has been authorised to complete the repaving with wood blocks of the west side of the Broadway. A plan submitted by the Surveyor for rebuilding 130, King-street has been approved.

Kensington.—Tenders are to be invited for making up the extension of Highlever-road as a new street, in accordance with drawings and specifications prepared by the Engineer.

Lambeth.—Plans lodged by Mr. T. H. Williams, for permission to drain ten houses proposed to be erected in Rosendale-road, West Dulwich, have been approved. Plans have been lodged with the London County Council by Messrs. Edwin Evans & Sons for the formation or laying-out of a new street to lead from Brixton-hill to Acre-lane.

Levensham.—Artificial stone in lieu of tarpaving is to be laid in a portion of Well-meadow-road at an estimated cost of 225s. The following plans have been passed: Messrs. F. & W. Abbiss, five houses, Barmby-road; Messrs. M. F. E. Rosser, six houses, Honor Oak-road; Mr. William Allam, twelve houses, Manwood-road; Messrs. Hill & Tyler, picture palace, Westdale-road; Mr. A. J. Roddis, six houses, Rushford-road; Mr. James Wallis, six houses, Arran-road; Messrs. G. E. Wallis & Sons, Ltd., addition to Pentland House, Old-road, Lee; Messrs. W. J. Scudamore & Sons, five houses, Newstead-road, and four houses off St. Mildred's-road; Messrs. Holliday & Greenwood, Ltd., cinema theatre, High-street; Mr. J. W. F. Phillipson, rebuilding Sunday-school, Stanstead-road.

Wandsworth.—Tenders are to be invited for repairing the carriageways of a portion of Wimbledon Park-road and Viewfield-road in Southfield. Plans have been passed for Mr. A. Dawkins for the erection of nine houses in Clarendon-road, seven in Hotham-road, and nineteen off Clarendon-road, Putney; as have also plans for Mr. J. Johnson for the erection of three shops in Beechcroft-road, Balham.

Matthew & Co., 88, Wigmore-street, W.; iron buildings, Liverpool, Alexandra Dock—Mr. Harbrow, Iron Building Works, S.

Mr. Clement Clive-Bagley reports that the Polish Cement Works, which had produced 600,000 and 1,100,000 barrels of 360 lb. each in 1909 and 1910 respectively, increased the output to 1,400,000 barrels in 1911. The imports of cement from Germany and Austria were 80,000 barrels, and as the agreement between the Polish Cement Syndicate and the German and Austro-Hungarian Works was maintained during 1911, it was possible to raise local prices to the level of the foreign market, i.e., 100 marks per barrel in the previous year. As a consequence of larger output and higher prices, the Polish cement industry had a very satisfactory year's working and paid dividends of 15% to 20% to its shareholders. In the last ten years there was a demand on the Warsaw Exchange for the shares of Polish cement works, and transactions took place at par and over. The activity in this industry has been ascribed to the large property owned in nearly every branch of industry, and especially to the development in the building trade, both in towns and provinces. Government orders remained at about the same quantities as in 1910, but the private market was much larger. The demand for bricks was even larger than in 1910, so that all brickyards were kept busy throughout the year and prices per 1,000 rose still further, i.e., from 12 s. 8d. in 1909, and 12 s. 6d. in 1910, to 12 s. 12d. in 1911.

Attempts were made to encourage the use of bricks made of sand and cement. The experiment was only successful to a limited degree, as it is difficult to compete with ordinary bricks, which are made of local material, and owing to the subsoil being clay, and thus transport from long distances can be avoided. Roofing tiles were used in larger quantities in 1911 than in previous years, and insurance companies are now offering a premium for buildings so covered than for those where thatch is employed. This may induce the peasant population to employ tiles to a larger extent than heretofore, thus will only increase the local demand for tiles well in 1911 and lead fairly high dividends.

According to the British Consul at Warsaw (Poland), the building trade, which experienced great activity during 1910, continued its satisfactory development during the past year, and the building of new houses was not retarded. Loans were granted on easy terms by the banks and financial institutions, and the relations between masters and men being good throughout the country, the present year was highly successful operation. Though the number of houses built or repaired in Warsaw itself dropped from 1,645 in 1910 to 1,425 in 1911, there was a considerable increase in the building of houses in the towns and villages of the country. High rents and the increased cost of living are gradually driving the less well-to-do classes to live in small country places in the neighbourhood of Warsaw, and consequently are served in respect of transport by the principal lines of railways, and in consequence there has been an abnormal development of such villages into small towns. This change is not, however, due to any special circumstance, but is a fact that no extension of Warsaw beyond its limited boundaries has been possible in consequence of the refusal of the military authorities to allow the building of new holdings in the neighbourhood of the fortified town.

This prohibition was, to a great extent, withdrawn, and the near future should open up possibilities for the sale of British building goods in the new areas of construction, which will have now been made available. Much will depend on the development of the new system of tramways to these new suburbs, and the amelioration of the services of the light railways which exist on both sides of the Vistula. Here again British capital might be used with every prospect of satisfactory results. The Austrian population continued to rise, due, no doubt, to the increase of 15,000 inhabitants during the year. The total population of Warsaw was, in 1911, 797,000, exclusive of military forces of some 25,000 men. The improved building standard is still to be seen in the reconstruction of the city. It has made considerable advance, and so-called first proof buildings are the only type now sanctioned. This naturally creates, and will create, a demand for fireproofing material which is worthy of attention from British manufacturers. The obligatory system of municipal fire insurance introduced in Warsaw in the year 1900, and all buildings have to be insured with the municipal fund up to the actual cost of the building. The demand for bricks was even larger than in the previous year, as the bricklayers were kept busy throughout the year. The price of bricks rose still further. Attempts were made to encourage the use of bricks made of sand and cement. The experiment was only successful to a limited degree, as it is difficult to compete with ordinary bricks, which can be made throughout Poland. The use of concrete, of clay, and thus transport from long distances can be avoided. Dealing with the cement trade, the Consul states that the Polish Cement Works, which had produced 600,000 and 1,100,000 barrels of 560 lb. each in 1909 and 1910, produced 1,200,000 barrels in 1911. The import from Austria-Hungary and Germany was about

Messrs. S. W. Francis & Co., Ltd., send us their latest catalogue of revolving shutters, in steel and brass, shop-fronts, and collapsible, extendable steel gates. The revolving shutters manufactured by the firm include interlocking, curvilinear, and corrugated steel lath shutters, and steel-hinged pinewood lath shutters, suitable for every purpose. Among important contracts recently executed for garages by Messrs. Francis are shutters for Messrs. Harrod's Receiving Yard, Chelsea; the Royal Automobile Club, Pall Mall; the General Motor Car Company, Waltham Green; and Holkham Hall, Norfolk.

Messrs Thomas Faldø, of Somers, Wharf, Rotherhithe, and 1, Arundel-street, Strand, W.C., forward us a common-sense pamphlet, entitled "A Few Simple Facts about Asphalt," in which they point out the difference between foreign and British asphalt, and the points to be guarded against in each case. Messrs. Faldø manufacture at their works in London asphalt from the Seyssel and Limmer mines, and are, especially with regard to the latter, which the raw material is derived so that "Seyssel" and "Limmer" are not merely "trade names," or, to speak more precisely, "trade marks," but truthful statements of fact. British asphalt is also a specimen of the firm, who have been in the trade since the infancy of asphalt as a building material.

(Continued on page 367.)

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, —; Contracts, iv. vi. vii. x.; Public Appointments, xix.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

.* It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

- SEPTEMBER 30.—**Dublin.**—UNIVERSITY COLLEGE: New Buildings—Limited architectural designs in Ireland. Assessor, Mr. H. T. Haro, F.R.I.B.A.
- SEPTEMBER 30.—**Llanelli.**—SCHOOL, ETC.—The Llanelly Education Committee invite competitive designs and estimates for school buildings and domestic subjects centre at Stebonheath-terrace. Assessor, Mr. G. E. Halliday, F.R.I.B.A. See advertisement in issue of August 2 for further particulars.
- OCTOBER 7.—**Beckenham.**—PUBLIC ELEMENTARY SCHOOL.—Mr. A. W. E. Cross, F.R.I.B.A., assessor. Selected architects only.
- OCTOBER 14.—**Batham.**—SWIMMING BATH.—The Wendsworth B.C. invite designs for a Public Swimming Bath. See advertisement in issue of August 16 for further particulars.
- OCTOBER 23.—**Glasgow.**—DESIGNS FOR EXTENSION OF MUNICIPAL BUILDINGS.—The Glasgow Corporation invite architects to submit preliminary sketch designs in competition for the extension of the Municipal buildings. Five will be selected to submit complete drawings in final competition. See advertisement in issue of July 12. Dr. Burnet, assessor. Deposit, 1*l.* 1*s.*

TRADE CATALOGUES—continued from page 365.

Messrs. Swain, Verney, & Co. send us their latest catalogue of brass and iron goods, chiefly door and window furniture. Among the items of interest which more particularly attract attention, we notice the "Reliance" patent lock, an excellent contrivance designed to operate panic-bolts from the outside. By this means a door, on which a panic-bolt is used, may be used when required as an ordinary entrance door, by means of the external brass knob which turns a spindle and operates the bolt. By a turn of the key in the lock the brass knob is put out of action, leaving the bolt free to act only on pressure on within in the usual way. The McCabe ball-bearing hangers for "acmodation" articles are admirably straightforward and simple in design, and are fitted with ball-bearings throughout. The blocks in the cata-

logue show the general principle and the manner in which the fitting may be concealed. Partitions hung in this manner have been supplied to the London, Birmingham, and Sheffield Council Schools. The same principle is applied to heavy barn or warehouse doors, and to overhead trolleys, which are also made to run on the bottom flange of the ordinary I beam. Messrs. Swain, Verney, & Co. also supply the "Anglo" patent liquid door-spring and check (a well-designed contrivance, suitable for both right and left hand doors), cloakroom fittings, faintly openers, and builders' ironmongery of nearly every description.

We have received from the National Radiator Company, Ltd., particulars of a new type of damper regulator for low-pressure hot-water boilers. The regulator has a very wide range of action, and by shifting the weight provided on the lever, the water in the boiler

can be maintained at any temperature between 120 and 220 deg. Fahr. The construction of the appliance is very simple, the regulator consisting essentially of an outer dome enclosing metal bellows connected by means of a tube with the bulb, which should be inserted at or near the flow outlet of the boiler. The bellows and a portion of the bulb are filled with a highly volatile liquid responding immediately to the slightest change of temperature. By means of a simple plunger attached to the upper wall of the bellows, the expansion of the latter has the effect of actuating a rocker and the lever, to which are connected the draught doors of the boiler. The fulcrum carrying the damper lever is pivoted on knife-edge bearings to ensure extreme delicacy of movement and freedom from friction, and as the distance between the pivots on the fulcrum is $\frac{1}{2}$ in., the regulator possesses great power.

PATENTS.

APPLICATIONS FOR PATENTS.*

- 14,740 of 1911.—Everard Richard Calthrop, Leonard Erskine Hill, and Herbert William Child: Production of sash-bars and the like for use in glazing roofs, windows, and structures in general.
- 18,351 of 1911.—Arthur George Grieve and George Anderson & Co.: Apparatus for stone and marble cutting and for like purposes.
- 19,102 of 1911.—George Chisholm: Flanged metal pipes, particularly applicable for effecting joints with water-closet cisterns.
- 19,133 of 1911.—Alfred James Hill: Joints for tubular structures.
- 19,175 of 1911.—Benjamin Burnette and Frank Centennial Avery: Hinges.
- 19,196 of 1911.—Henry Augustus Allen: Stoves and fireplaces.
- 21,282 of 1911.—Frederick Herbert Sharpe: Method of and apparatus for manufacture of white lead.
- 23,917 of 1911.—William Knott, Frederick Charles Giles, and Alfred Giles: Casement fastenings and the like.
- 24,070 of 1911.—Samuel Stott and John Thomas Booth: Planks employed by painters and decorators.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name) relating to advertisements and other exclusive matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at the office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from intention to this.

Any communication to a contributor for publication, is given or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, who is subject to the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Prize Design in any important architectural competition will always be sent for publication by the Editor, whether they have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

* Our aim in this list is to give, as far as possible, the average price of materials, not necessarily the lowest. Quality and quantity obviously affect price—a factor which should be remembered by those who make use of this information.

ARCHITECTURAL EDUCATION AND THE LIVERPOOL UNIVERSITY.

IN view of the importance in these days of the education of the young architect, we make no excuse for returning to the subject of his academic training, and are pleased to deal here with the teaching of a University which was the first in this country to offer a degree in architecture. The School of Architecture of the Liverpool University was started under Professor F. M. Simpson in 1894, and for many years was the only University school in England in which regular day courses existed. In 1899 a Degree course was instituted, the degree conferred on successful students being B.A. Shortly after the appointment, in 1904, of the present occupant of the chair, Professor C. H. Reilly, considerable modifications in the course were made, which differentiate it from the Degree course of the London University, dealt with *in extenso* in our issue of September 13 last. It was decided to put the architectural course on a similar footing with other technical subjects, such as Engineering and Medicine, and to give a definite degree in Architecture. That

is to say, instead of Architecture forming a subject for an Honours school for a B.A. degree, it was decided to create the first purely architectural degree in this country—B. Arch. This was following a precedent which had already been set in America, where several such degrees are given. There had also been a feeling that a three-years' course was too short for such a subject as architecture, for which the student frequently arrived without any preliminary training, as compared with the ordinary arts student whose course at the University carried on his former school work. The course of study for the new degree was lengthened to five years, and, in order that the practical nature of the training might be emphasised, the last two years are required to be spent in the office of an architect, provided that the student attends in the evening some recognised school, like that of the Royal Academy, an atelier attached to the Ecole des Beaux-Arts, or the Liverpool School itself.

In order to enter this Degree Course of five years corresponding in length to

a medical course, the student has to matriculate, unless he gains an exemption. His first year is spent in general studies of a University nature, among which the History of Architecture is included, and at the conclusion he takes the Intermediate Examination for the B. Arch. During the next two years takes place his purely architectural training in the studio, and at the end of this period he passes the second examination. The student, however, is not allowed to sit for this examination until he has satisfied his teachers—constituting the Board of Studies—in four large designs (these consist of the "Testimonies of Study" for the Final Examination of the R.I.B.A.), which occupy about one month each of his time, in addition to four small designs, occupying about a fortnight each. During the preparation of these designs the student has the benefit of the assistance and criticisms of his instructors. In the examination, however, in order to establish a more accurate test of his capabilities, a further month is devoted to a design, which he has to

By Mr. W. H. Thompson.

carry out entirely by himself, working *en loge*. The examination also consists of a series of written papers in History and Construction, and the student submits to the examiners a measured drawing of an approved building, together with all the designs prepared during his course.

This second examination entitles the student to the University Certificate in Architecture, which, if obtained in the first class, carries with it exemption from the Intermediate Examination of the R.I.B.A. It is also possible for a student who has not the time to enter for a complete Degree Course to take this certificate by itself, in which case he

need not matriculate or pass the Intermediate B. Arch., but must satisfy the examiners in the same purely architectural tests as the degree student. The student entering for the certificate alone must be over seventeen years of age and must satisfy the Professor of Architecture as to his general education. He is then eligible to pass directly to the two years' course in Architecture. After the certificate examination, both types of students enter offices, but keep in touch with the School by joining its evening classes or by sending back designs. If the student elects to enter a London office he can attend some other recognised school, and at the end of the two years

present himself for the Final Examination which, if he has matriculated, must be for the B. Arch., and if he is a non-matriculated student, for the Diploma. This latter is a severely practical examination corresponding closely with the R.I.B.A. Final, but with more emphasis laid on the subject of the design. The first external examiner to the School of the new Degree Course was Professor Blomfield, A.R.A., and the present external examiner is Mr. Ernest Newton, A.R.A.

So much for the necessary qualifications for the degree. A modification has already been effected with regard to the actual work, as shown by the type of design

University of Liverpool School of Architecture: Design Awarded Lever Prize. Scheme for New University Buildings, Liverpool.

By Mr. W. H. Thompson.

University of Liverpool School of Architecture : Lever Prize Competition. Scheme for New University Buildings, Liverpool.

By Mr. R. F. Dodd.

which the School encourages under the teaching of its present head. Ten years ago, when the Arts and Crafts movement was still in its first vigour, the training of an architect as a general craftsman was considered by most people to be the essential thing; but a considerable change has come over the Liverpool School of late years owing to its adherence to definite methods of design. It has worked out for itself and inculcated the theory, for which there is a good deal to be said, that teaching to be effective for beginners must be academic rather than eclectic—that is to say, that it must follow a definite mode of thought. The Liverpool School has chosen as its definite

means of expression the formulæ of classical architecture. It believes that these formulæ, handed down as they have been from periods when architecture found expression in *motifs* far purer than those of our own country to-day, at once set a high, if somewhat rigid, standard of taste, which is an invaluable mainstay to the beginner. The results of this adherence are manifest in the work of the students thus trained, some idea of which can be obtained from the drawings reproduced herewith. They seem to show that a system, working on these definite lines, has power to enable the student to arrive at a standard of design which would be quite impossible under

a system in which the details of different styles were studied with equal ardour. It is felt by those who uphold this method that the student who has learnt the essence of design in the classic idiom—the most intellectually severe of all idioms—can at any subsequent time learn to express himself in other languages.

In accordance with this definite method in the teaching of design, the Liverpool School has developed a definite training in draughtsmanship. Students are taught from the outset to render and shade their drawings, thus imparting an interest—which was formerly nonexistent—to a simple drawing of such an

University of Liverpool School of Architecture : Lever Prize Competition. Scheme for New University Buildings, Liverpool.

By Mr. R. F. Dodd.

exercise as a classic Order. To give further value and interest to this early part of his work, the student is required to combine the details of the Order and the building from which it is taken, together with any cognate ornament, into a simple composition, after the manner practised at the Ecole des Beaux-Arts. By this means the elements of design and composition enter into the first problems which he undertakes.

While the definite and circumscribed character of the teaching given at Liverpool may have tended to alienate some students of architecture, it has certainly had the effect of attracting others, including Colonial and American students. The type of design fostered and the methods of draughtsmanship certainly prove useful to men entering for competition work. Whether those who do not look beyond small domestic work will find them so immediately helpful is another matter; but a severe grounding in the grammar of an art can never do an artist any harm. The teachers of the School are of opinion that it is more logical to begin with big and general ideas which give full scope to the imagination, and from these to evolve the cottage, than to attempt to make the palace and town grow by means of inflating and reduplicating the cottage.

The Department of Town Planning, which was added to the School of Architecture in 1909, carries on the same method of approaching the city as a great single conception—a stone with a myriad facets—rather than a collection of separate homes. This department is under the direction of Professor S. D. Adishead, and it works in close touch with the School of Architecture: the association must be of great benefit to students of both subjects, as the town-planner too frequently neglects the architectural aspect of his work, and the architect often forgets that his greatest buildings can never be thought of alone, but that they are parts of a great and complex whole—the city.

THE NORWICH FLOODS.

WIDESPREAD interest has naturally been shown regarding the floods which recently wrought such havoc in the district around Norwich. Among other incidents it was reported that about fifty bridges and culverts had been damaged or destroyed. How was it possible that this catastrophe could happen? What means should be adopted to prevent such an occurrence in the future? The whole tract of country—which practically forms the eastern portion of Norfolk—is interlaced with small rivers, winding in a most unconventional manner, and opening out either directly or by small tributaries into the "Broad." Travel along any of these rivers and practically no high banks will be found. These rivers are all tidal streams, for this is not a flat tract of land forming a tableland; it is, indeed, at sea level. Hence the meaning of the Broad. They may almost be termed permanent overflows. They are not lakes, but points at which, even at low tide, these rivers or their tributaries cannot keep to a narrow channel, but must overflow. But for certain artificial

banking, much more land would be always under water. That and the large element of sand save the whole region from being one huge marsh. It is in these considerations that the hopelessness of the whole problem would seem to lie.

What is to be done for the City of Norwich? The city stands on the banks of a tidal stream, in the midst of low-lying country. To dam back the rivers to any extent would mean certain disaster in the event of any abnormal rise. In the case of one single river flowing through our ordinary country it is a very different matter. During the recent torrential rains the Thames Conservancy so manipulated their sluice-gates that the river was kept considerably below summer level, so that at London, for all one might have known from observation, the conditions up-stream were normal. Could not some feat of drainage be effected to save Norwich from another deluge? Look to the past history of the city. As early as 1258 the flooding of Norwich is recorded. Since that date the city has suffered at least a dozen floods.

In the recent flood the water rose 16 ft. 6½ in. above mean water level, the nearest approach to which was in 1614, when the level rose to 15 ft. 6½ in. It is a sad record, the more so as apparently the same thing has to be looked for again, so long as our climate persists in its spasmodic behaviour. For any one of our cities to suffer a rainfall in one day which ordinarily should take a month would severely tax the most stringent precautions, where these were possible. But to Norwich such a phenomenon would again surely spell certain disaster. In point of fact we feel none too happy as to the safety of certain other of our ancient cities. Have we, then, only to hope for Norwich that she may be spared her share in the whims of the elements, so that her natural system of drainage to the sea may be found sufficient to cope with normal conditions?

NOTES.

A New Landmark in London.

of buildings which are conspicuous, and otherwise memorable for their associations, it happens, fortunately, that the frequent appearance of notable substitutes has to be recorded also. Old landmarks, like old friends, are removed, and if life is to be made interesting new associations must be established. "A man, sir, should keep his friendship in constant repair," said Dr. Johnson to Sir Joshua Reynolds; the same necessity arises with things artistic as well as human. Not a few will look with neighbourly eyes on the Central Wesleyan Hall at Westminster, inaugurated yesterday. This building, though lacking its towers, is one of the most striking architectural works of the new century, and the architects, Messrs. Lanchester & Rickards, must be congratulated on realising the design which in 1903 won them the opportunity to build. The site is a prominent one, and

the dome, which crowns the Wesleyan Hall, is already pointed out to strangers from many vantage-points in London, from the Park, the Embankment, the Waterloo Bridge, for instance. The building is a new landmark. Next we hope to illustrate it and to give an authoritative record of its construction which should be of special interest.

The Regent's Quadrant Committee.

COMMENTING on the constitution of the Regent's Quadrant Committee, the *Daily Telegraph* concludes that the trading element should be represented, and gives currency to the suggestion that one or two distinguished architects who have no official connexion with any Government department might be added to the list. These suggestions are reasonable enough in themselves, would have greater weight if the Committee were put forward as being, in the widest sense, public and representative in character. But, although we ourselves welcomed as pointing to the acceptance of the principle of municipal control, we should hardly be justified, we presume, in saddling it with the responsibility of attaching to a committee appointed by an authority representative of London as a whole. The Crown happens to be one of the ground landlords of London, and this capacity alone it appears to act. It may find it advantageous to consult prospective tenants, but that, after all, is its own affair. There are, however, other interests involved than those of the Crown estates. If the whole question is to be considered in the public interest and from the point of view of London as a whole, London itself might well be represented, not only by its own official architect, but also by independent architects who have given special attention to the wider and more monumental aspects of town planning.

Architectural Losses in Japan.

ON September 22 Japan experienced one of the terrible typhoons which with equally terrible earthquakes are perhaps her worst natural plagues. At the time of writing full details are not to hand, but it is evident that the storm raged along a line of over 500 miles from east to west wrecking and damaging shipping at Yokohama and at Shimonoseki, which are fully that distance apart, as well as off Tsuruga, which lies somewhat to the north-east of the central point in the straight line joining the first two places named. To the south of Tsuruga lie Kyoto and the Home Provinces of Old Japan, and the meagre statements at present available indicate that many of the most valuable architectural monuments in this district have suffered. The localities chiefly affected are Osaka (which has been called the Venice, and, more recently, the Manchester of Japan) where 20,000 houses were ruined and the breakwater and harbours washed away, Gifu, Nagoya, and Nara. At Nagoya not a house escaped damage. But it is at Nara that, from the architectural view point, the heaviest blow has fallen, in the collapse of the Kasuga Shrine, which was founded in the VIIIth century (A.D. 767, or thereabouts) by one of the Fujiwara family and dedicated to his ancestors, the

hinto god Ama-no-kayane and the goddess his wife. The buildings and their enclosure had all their wooden framing coloured red, and with their white plaster infilling looked brilliantly rich against the dark cedars in the background. There is no report yet as to the great temple containing the gigantic statue of Buddha, so we may still hope that it, at all events, has been spared.

The Insurance Act. A FIRM of builders was recently summoned under the Insurance Act for having detained insurance cards after the termination of the employment of two workmen. In one case it was stated this had been done in order to retain a hold upon the workman, who had been overpaid. It was also stated in defence that the firm had 4,000 cards to make up, and, although they employed two clerks specially, it was impossible to make up the cards at once. It is obvious that neither defence could avail under the Act. The card has to be produced by the workman to any fresh employer, and it is essential to him to have it, therefore the employer cannot retain it for his own purposes. When the engagement is being terminated there can be little difficulty in making up the cards of those workmen who will no longer be employed. As the workmen had been deprived of a chance of securing employment, substantial costs were granted to them by the magistrate. The magistrate stated that the Act says quite clearly that the card must be given up at the termination of the employment, but as in our opinion the Act does not clearly define this, but it is the Rules which are made under the Act which deal with this subject, it may assist our readers if we explain how the matter stands. Under Part I. of the Act upon the termination of the employment the insurance card shall be returned to the contributor by the employer, Rule 5 (3), of the Rules, dated May 22, 1912. Under Part II. of the Act a similar provision is made as regards Unemployed Insurance books by Rule 5 (1), of the Rules, dated May 6, 1912. In the Rules will be found no penalties for a breach of the rules, but as regards both parts of the Act by sects. 69 and 102, respectively, it is provided that if any employer or workman refuses or neglects to comply with any of the requirements of the Act or the regulations made thereunder penalties may be imposed on summary conviction.

RECENT EXCAVATIONS AT ROME AND POMPEII.

By DR. THOMAS ASHBY.

THOUGH at the present moment no excavations upon a very large scale are being carried on in Rome, there is a good deal of activity in various directions, and a short account of what is being done on the principal sites may be welcome.

In the Forum Romanum little has been done of late except at the Basilica Æmilia, where the south end of the nave has been cleared. There three strata have been found—(1) a thin layer of ashes, with coins and remains of wood and iron (the latter belonging no doubt to the roof) lying on the pavement; (2) a stratum of earth 3 ft. thick, with fragments of the splendid architectural members of the building, in white marble, lying upon it; (3) the west wall of the nave, which fell inwards, probably in the VIIIth

century A.D. The conclusion seems to be that the building was never restored after the fire of the VIIth century A.D. (as has been hitherto supposed), with a line of red granite columns along the façade instead of the arcades that had hitherto existed; but that these columns had some other use; and that it was not totally destroyed by the fire, but lay abandoned until the collapse of the nave wall already mentioned.

On the Palatine, which, as well as the Forum, is under the charge of Comm. Giacomo Boni, work is going on in the Palace of Domitian, which succeeded the Palace of Augustus, destroyed by the fire of Titus, and continued to bear its name. It has been found that the centre of the peristyle was almost entirely occupied by a large rectangular water-tank, decorated with small niches, within which was an octagon; in later days the interval between the two was filled up, so that the octagonal tank alone remained in use. Considerable remains of the marble and granite pavement of the *trichinium*, or state dining-room, have come to light under the enclosure wall of the Villa Mills, which has now been removed, as the villa has passed into the hands of the Government, and a number of architectural fragments have been found. A nymphaeum corresponding to that already known has been laid bare on the south side of the peristyle, and other rooms are being excavated; so that the whole of the northern portion of the palace, which contained the state apartments, will soon be open to view. The central portion must have contained the private rooms of the Emperors, and the villa is built into the ruins of them, so that it would be very difficult to demolish it without damaging them. The southern portion, which was the garden (the so-called *hippodromus* or stadium), has for many years been fully excavated. Mr. G. Gordon Leith Herbert Baker student of the British School at Rome, is engaged on an architectural reconstruction of the palace. Important discoveries have also been made at lower levels of remains belonging to the original palace of Augustus and to houses of the Republican period, of which Comm. Boni will give an account at the forthcoming Archaeological Congress in October.

Comm. Corrado Ricci, the Director General of Antiquities and Fine Arts, has for some time had at heart the excavation as far as possible of the remains of the Imperial Fora—those of Julius Cæsar, Augustus, Nerva, and Trajan—and has published an interesting article on the subject in the *Bollettino d'Arte V.* (1911), pp. 445 *seq.* He begins by admitting, reluctantly, but rightly, perhaps,* that a complete excavation of the whole site is impracticable. The cost would be enormous, and the hindrance to traffic so considerable as to be incompatible with the necessities of modern life. He therefore proposes that, inasmuch as the solution of the problem of communication between the Via Cavour and the Piazza Venezia cannot be very long delayed, the scheme to be adopted should be one which would give a minimum of demolition and a maximum of archaeological results and monumental effect; for the completion of the monument to Victor Emmanuel II. on the Capitol renders it absolutely necessary that the enormous edifice should have a proper setting. The first steps have already been taken at several different points.

One of the two remaining columns (now known as the Colonnae) of the colonnade which surrounded the Forum of Nerva has been cleared down to its base, which has been found over 15 ft. below the modern level. It is a single shaft, some 30 ft. high and 3 ft. in diameter, of white marble. The excavation is to be continued in the autumn, and is to be left permanently open. The Gilchrist student of the British School at Rome, Mr. J. S. Beaumont, has in hand a reconstruction of

* Cf. Prof. Hulsén's comments in *Internationale Monatschrift für Wissenschaft, Kunst und Technik*, Aug. 1912.

the entire Forum, which was largely the work of Domitian. The temple in its centre was dedicated to his favourite goddess, Minerva, and the existing columns still support a baselief representing the goddess, and a frieze showing the practice of the arts over which she presided. The Forum, indeed, was sometimes called by her name.

The Temple of Minerva was unfortunately destroyed to its foundations under Pope Paul V. in 1606, to provide material for the great terminal fountain of the Aqueduct of Trajan, which he repaired (the *Acqua Paola*, as it was called thenceforth) and brought to the Janiculum, the prominent hill on the right bank of the Tiber; but it is represented in drawings and engravings of the Renaissance, so that we have a good idea of its appearance, though the available evidence for the condition of the rest of the Forum in the XVIth century has not hitherto been used with so much accuracy as by Mr. Beaumont. When the excavations of the Basilica Æmilia are completed it is probable that the lower (western) end of the Forum will be found within a few yards of it, but the main portion of the Forum itself remains buried deep below some rather unattractive houses; and though there is no doubt that, if it were possible, it would be of great interest and importance to excavate the whole site of this as of all the Imperial Fora, we have already seen that this idea must be abandoned. Here, therefore, as also farther to the north, Comm. Ricci makes the modern Via Alessandrina the western limit of the "monumental zone" which would be left permanently exposed to view. The area of the Forum of Julius Cæsar, about which we know very little, would be left unexcavated, at least for the present (some day it may be possible to explore it, when the mean houses on its site give place to buildings of greater importance), but the already-known remains of the *taberna* or shops which surrounded it, splendid specimens of Roman Republican masonry in filthy surroundings, would be rendered more clearly visible and easily accessible. The open area which formed the western portion of the Forum of Augustus would, similarly, be left untouched, but in the more important eastern part a considerable amount of work could be done. The northern apse or exedra and the greater part of the Temple of Mars Ultor (the Avenger) which occupied the centre of the eastern side of the Forum are included within a convent of strictly-enclosed nuns, and, as the photographs published by Comm. Ricci show, the remains are imposing and would be well worth clearing. They consist especially of portions of the great enclosing wall of the exedra and Forum (the finest and loftiest specimen of ashlar masonry in Rome, only comparable with the great stage wall of the theatre at Orange) and of the massively-built chambers beneath the temple, which stood on a lofty podium. The southern exedra was partially cleared in 1888, and the work is to be completed. The palace built by Cardinal Barbo about 1470 for the Knights of Rhodes, with its picturesque loggia, is also included in the monastic buildings; but this would, of course, be preserved.

The eastern exedra of the Forum of Trajan was known to Renaissance architects under the erroneous name of the Baths of Paulus Æmilius, and was excavated almost a century ago. It is a two-storied, arcaded building, with very fine brick facing, and forms the transition from the Forum to the Quirinal Hill, serving at the same time as an embankment against its slopes. Behind and above it lie other buildings connected with and contemporary with it, including a large vaulted hall and some arcades of interesting construction, which are now incorporated in the barracks which have been placed in the ex-convent of S. Catherine of Siena.

It is intended to clear away all later additions, so as to leave them exposed, and at the same time to isolate the huge mediæval leaning tower known as the Torre

delle Milizie, or the Tower of Nero. This, which has hitherto been inaccessible, will afford a very fine panorama of this portion of Rome. Here, too, the work is already in progress, and it has been found that the tower rests in part upon Roman ruins, in part upon a Roman paved road, which probably descended behind the Forum of Trajan to the entrance of the Forum of Augustus. A modern street is to be formed on much the same lines, and will be a considerable assistance to traffic. The western exedra of the Forum, which lies under the slopes of the Capitol and the great monument, is not included in the "monumental zone"; but inasmuch as the mean houses which occupied its site have recently been demolished, we may fairly hope that we shall at least learn something of its remains before this portion of the surroundings of the monument is finally laid out. A portion of the open area of the Forum and the colonnades on its east side are also included in the area to be left permanently open, and, as we know practically nothing of them, this is especially welcome; while the west end of the Basilica Ulpia (the central portion of which is what we really see in the present Piazza del Foro Traiano (an unfortunate misnomer) lies under a block of buildings which is also scheduled for demolition, though here again the site cannot, it seems, be left open permanently. It will be clear from this short summary that, if Comm. Ricci's scheme can be carried out in its entirety, we shall have exposed permanently to view, if not the whole site of the Imperial Fora, as much, perhaps, as can reasonably be hoped for, when the exigencies of modern life are taken into account.

In connexion with the *Passeggiata Archeologica*, a great deal of important work is going on at the Baths of Caracalla, which are being completely isolated and cleared. Hitherto the central building alone could be properly studied, but now the subsidiary buildings which enclosed it have been carefully excavated under the direction of Professor R. Lanciani. The large halls on the west, corresponding to those on the east, are fairly well preserved, and where this is not the case the two groups fortunately complete one another. On the south are other halls, and two rooms which are in all probability libraries, as they correspond in arrangement with those already discovered in Asia Minor, at Pergamum and elsewhere. There are considerable traces of the use of the building as a quarry for many centuries; a large mediæval linekin has been found on the spot; while the recent excavations have brought to light an Ionic capital of peculiar form, with a small figure of Harpocrates in each of the volutes, which corresponds exactly to one in the Church of S. Maria in Trastevere, doubtless brought thither from the baths when the church was built. In front of all these halls was a colonnade, facing on to a large garden between them and the main building, which will be replanted.

Two fine archaic terræ of Apollo and Bacchus have been found, besides some fragments, but the most interesting discovery in the domain of art was that of a splendid statue of Venus arranging her hair, found in a room annexed to a large subterranean shrine of Mithras. This was reached from the underground passages of the baths. A painting and several fragments of a bas-relief representing Mithras have been found, and the internal arrangements of the sanctuary are very well preserved. We may notice that before long another important shrine of Mithras, that which lies beneath the Church of S. Clemente, will be rendered accessible by the drainage of the water which for years has accumulated in it; this work will shortly be carried to completion, a connexion being made with an ancient drain which runs deep below the Colosseum.

The planning of the passages and chambers (some of which are of great size), for service, stores, and, at a lower level, for drainage, reveals marvellous care and forethought.

The main entrance passage on the west is so wide that a small Décauville locomotive and train can run in and out of it, and the full extent of the subterranean portion of the baths is over a mile. The upper part of these galleries was used for service and for stores, while below them ran the channels for carrying off the waste water; whether this eventually ran is not yet known. The water supply was brought by a special aqueduct which led to a huge reservoir of thirty-two compartments on the south side of the garden. The earth which is being removed is being taken out through the Porta Metronia to fill up the marshy ground outside it, and render it a possible site for working-class dwellings. When the whole block of buildings is cleared it will present a most imposing appearance.

The last of the great terræ of Rome in point of date, the Baths of Diocletian, covered an even greater area than the Baths of Caracalla, but their site is largely occupied by modern buildings. A good deal of the central portion of them was, however, cleared, and served for the archaeological exhibition of 1911 (see *Builder*, September 15, 1911), which will, it may be noted, be open for the Archaeological Congress in October.

The objects collected for it, consisting as they do in the main of casts, reproductions, plans, photographs, etc., will form the nucleus of a permanent museum of the antiquities of the Roman Empire, but whether this will continue to occupy the baths is very doubtful, as these great halls cannot be warmed in winter.

Some important additions have recently been made to the Museo di Villa Giulia, housed in the beautiful villa which Vignola erected for Pope Julius III. outside the walls of Rome. It was originally opened some twenty years ago to receive the Etruscan objects discovered in the territory of Falerii, to the north of Rome—vases, bronzes, etc., and also important remains of the polychrome decoration in terra-cotta of several temples, from the archaic work of the VIth century B.C. down to the productions of the Roman period (IIIrd century B.C.), some of which are remarkably beautiful. Similar terra-cottas found at the temple of the *Mater Matuta* at Satricum (the modern Conca, near Anzio), in Latium, and belonging also to the VIth century B.C., are exhibited here, and so are other objects of archaic art, showing Etruscan influence, but found in Latium. These examples of the architectural use of terra-cotta will especially interest students at the present day.

A special room is devoted to the important collection of objects from Præneste, the modern Palestrina, formed by the Barberini family, consisting mainly of objects from tombs—gold objects, bronzes (including several of the famous *ciste*, circular boxes decorated with incised designs as are also the bronze mirrors), ivories, wooden cosmetic boxes, vases, etc.

The important work at Ostia, which has already been alluded to in the *Builder* (June 18, 1910, page 704), has progressed considerably, but this demands an article to itself.

The excavations at Pompeii have been carried on this year on a somewhat larger scale than usual, the intention being to carry the clearing of the main transverse street, which bears the modern name of Strada dell' Abbondanza, as far as the amphitheatre, and thus connect it with the rest of the excavated area. The street was one of the most frequented in Pompeii, and was flanked by shops on either side. The walls are, as usual, covered with the names of candidates in the municipal elections, painted in red on the white plaster; but a new feature has been the discovery of paintings on the façades of some of the houses, one of which (protected even in antiquity by a pent roof) represents Venus of Pompeii in a chariot drawn by four elephants. The balconies of the houses are being carefully restored.

One of the most interesting is a wineshop in which the vessels of bronze and earthenware and the drinking glasses were found still in their places; one of the large copper built into the wall was found to be still half full of water. This shop will be preserved intact in the state in which it was found.

But the frescoes which have been discovered in a villa outside Pompeii, in land belonging to the proprietor of the Hotel Suisse, are far finer than those we have mentioned—probably the finest that have ever been found at Pompeii. There is one room decorated with lifelike figures representing Bacchic scenes, the interpretation of some of which is as yet obscure, which are marvellously beautiful. In other rooms there are paintings representing architecture of curious forms, the scheme being sometimes abruptly changed in the middle of a wall without reason, it would seem. A preliminary report has already been published, but the paintings deserve further study. The villa will probably be expropriated by the Government, and this is very desirable.

The Italians have already made a certain number of archaeological discoveries in Tripolitania (foundations, mosaic pavements, statues, etc.) in the course of military operations, and these are continually reported in the daily press. As soon as the initial phases of the occupation of the country are over, and the work of archaeological exploration can be systematically undertaken, there is no doubt that results of great importance will be obtained, as the whole district near the coast and for some way inland was far more thickly populated in Roman times than at present, and remains of considerable importance may still be seen above ground. The most imposing ruins are those of Leptis Magna (the modern Lebda) the birthplace of the Emperor Severus, where the ancient harbour, now partly silted up, can still be traced. But the Romans had also occupied the most important strategic points in the interior, commanding the caravan routes into the interior of Africa, and remains of their fortified posts may still be seen.

It seems not at all improbable that the Italians, when the moment comes for planting settlements in the interior, may be able to profit by the experience of their ancestors in the choice of suitable localities, and that what is now desert may once more return to cultivation. The water supply seems to be the chief difficulty, but we know that this was one of the points to which the Romans gave most attention, and the existence of the remains of aqueducts and reservoirs in any locality may point to its suitability for settlement at the present day, as showing that the difficulties had been already overcome in the past.

BAROQUE ARCHITECTURE:

IV.—GENOA AND TURIN.

(Continued from page 333.)

Genoa.

It may have already occurred to the reader's mind that we cannot devote the same amount of space (in proportion) to other Italian cities as has been given to Rome. It is perhaps as well, in view of the immense number of examples scattered all through the country, that one should be limited to a few centres, and that they should form, as it were, points of vantage from which the Baroque buildings of Italy can be surveyed as a whole. Suffering from the usual *embarras des richesses* in that land, our thoughts turn to Turin, with its well-ordered plan and magnificent palaces, to Florence as the home of so much immortal art, to Genoa and Venice as living relics of a splendid age, to Naples and Palermo as Southern capitals. We remember quaint corners which come within our scope in the sea-towns of the Maremma and the Adriatic, on the Venetian lagoons or on the Riviera coast, on the Alps and on the Apennines.

Florence, however, has few noteworthy monuments of this style; Turin has not the

the interests in the artistic and historical
mos as the other cities, and will be dealt
h briefly. Naples and Palermo are in
ilar case, but in less degree. Seeing,
wever, that Genoa and Venice derive
ch of their celebrity and their splendour
in their Baroque architecture, it will be
venient to devote the next two chapters
a consideration of its merits in their
ny streets and a comparison with what
have found in Rome. For Rome, after
possesses a quite disproportionate number
examples of the period, interesting alike
in importance, association, and variety;
d Rome must remain the key to Baroque
Italy. But after we have discussed Genoa
d Venice we will turn in a concluding
lian chapter to the less familiar byways
the style, and these may enable us to
pronounce with more finality as to its merits
a whole.

Genoa, "as every schoolboy knows,"
called "The Proud" (*La Superba*). And
ry one of her citizens, of her visitors,
an of those who read about her, knows
o, that the name is not due simply to the
nd sweep of her harbour front or to her
raced suburbs and palms, not even to
e magnificence of her port or the vast
circling wall of the Apennines, but largely
those few famous streets of palaces which
adame de Sta'l said were worthy to house
gathering of kings. It is not the least
tor in Genoa's pride that she can boast
the finest historic street in Italy.

This street, it must be remembered, is the
ork of one man, or rather its conception is.
nd one must think twice before claiming
leazzo Alessi as an exponent of Baroque
inciples. The historical test and the
ible test alike fail in such a case. For
palaces were raised in the debatable
are just as Baroque was gaining a hold
Italy, and their architecture is neither
ly-developed Renaissance of the culminat-
period nor the Baroque style practised
Borromini and his contemporaries. Yet
is in a measure the architecture of revolt,
new style originated to meet new require-
ents. It is, moreover, the architecture

of a grandiose and ostentatious period, of a
city at the highest point of a long prosperity.
And these two principles—ostentation and
originality—are among the recognised
characteristics of the style, whether accom-
panied or not by two other frequent
symptoms—picturesqueness and eccentricity.

Alessi's palaces are very numerous, for he
came at a fortunate time for himself and for
the city. He was trained in Per gia, his
native town (where he was born in 1512), by
an obscure artist—half painter, half architect
—by name Giovanni Battista Caporali, and
his forte was military architecture. But, like
many others whose reputation lay in such a

S. Maria di Carignano, Genoa.

direction, his later fame rested on widely
different work. He was, it is true, summoned
to Genoa, where his ability had evidently
been talked of, by the Sauli family to carry out
various private commissions for them, and
by the Republic to remodel the harbour.
Vasari states that he lengthened the mole,
or breakwater, but what is of more importance
to architects is his Porta del Molo, or entrance
to the warehouses on the breakwater. Built
in 1549-53, it may be compared with those
massive gateways at Verona erected by
Sammicheli a few years previously, and with
Ingigo Jones's water-gate at York Stairs. In
character it resembles the latter rather than
the former, but in severity there is little to

choose between these fine examples. It is,
like all Alessi's work, scholarly but original,
and it possesses two features common in
Baroque buildings—an enormous inscription
over the door, and a façade recessed on a
curve such as we find in Borromini's Sant'
Agnese at Rome.

For the Sauli he began that colossal
church which dominates the city on the south,
S. Maria in Carignano, and, though it is in
some ways his most important work, it is
perhaps the most disappointing. His in-
tention seems to have been to follow
Bramante's plan for St. Peter's, so we have
the Greek cross as a basis, filled out with
chapels to form a square. We do not know
exactly how far Alessi was responsible for
the design, which was not completed till
1603, but it seems probable that it was
entirely his. The proportions of the exterior
are its weak point, the dome being far too
small for the church itself and for the two
lofty *campanili* flanking the principal façade.
The general lines of the façades are Renais-
sance of an academic type, but in some of
the detail, notably in the west portal, we
find ornament of an uncontrolled originality.
The dome externally has many points in
common with the Jesuit church, S.
Ambrogio.

We may put aside Alessi's other work, his
alterations at the cathedral, his rebuilding
of part of the city walls, and concentrate on
that wonderful effort in town planning, the
Via Nuova, which nowadays, in common
with many another important street in
Italy, has been rechristened the Via
Garibaldi.

For town planning it was, as town planning
went in those days. Old Genoa was a mazy
labyrinth of dark lanes, much as it still is
to-day in those picturesque alleys between
the quays and Alessi's new street. The
Genoese nobility wished for a street in
which their projected palaces might be
seen to advantage, and it fell to Alessi's
lot to devise a scheme. The scheme is
undoubtedly his, but only a few of the
buildings. Of its twelve most famous
palaces only two can be definitely attributed
to him, and only four can with any certainty

The Palazzo Doris, Genoa.

[Photo. by Alinari.]

The Palazzo Carignano, Turin.

G. Guarini, Architect (1680).

[Photo. by Brogi.]

be attributed to his successors. Of the remaining six we are assured that he furnished the designs, and many authorities consider that he carried them out.

Be this as it may, we will begin by studying those two undoubted examples of his art—the Palazzo Cesare Cambiaso close to the Piazza Fontane Marose and the Palazzo Lercari-Parodi adjoining. There is a striking contrast between these two neighbouring buildings, a contrast which displays the versatility of Alessi's genius. The Palazzo Cambiaso is almost cubical in form and of a magnificent solidity. The height of the façade is between 60 ft. and 70 ft.; the cornice is over 4 ft. deep and of similar projection. Yet these two palaces are the least colossal in the Via Nuova and the best adapted in scale to the width of the street. The Palazzo Cambiaso façade—and here the façade is the most important feature—impresses one above all by its effect of monumental strength and simplicity, but in the broken pediments of the ground-floor windows, in the decorative ornaments of some of those above, one may surely discern those deadly "germs of the barocco corruption." It has been said that in the work of Michelangelo these germs are first to be found, but it is more satisfactory to place his masterpieces and Alessi's in that architectural borderland which lies between all great styles and which we term a transitional period. For the proportions of this Cambiaso palace follow classic tradition, and the signs of change are to be found in trivial details or in a general picturesqueness of grouping, just as one finds looking at the east end of St. Peter's. Alessi may perhaps best be placed, then, with Michelangelo and Palladio as one of those who made the Baroque period possible by their freshness and vigour of thought rather than by any Baroque works of their own.

This may again be seen in the Lercari-Parodi palace, a far more theatrical building. The lowest story of the façade is rusticated to excess—rusticated, too, in those diamond-shaped blocks beloved of the later Venetians. But here Alessi is verging away, further than

ever Michelangelo went, towards admittedly Baroque proportions and towards an original use of legitimate elements that is hardly legitimate in itself. To him is due the credit for the introduction of the loggia in the form which later architects brought to such a pitch of perfection, and which shares with the monumental staircase the monopoly of interest in Genoese Baroque architecture.

One feels inclined, then, to place Alessi between Michelangelo and the earlier architects of the Baroque period, and at the same time to recognise him as one of the greatest architects of the XVIIth century. In estimating his greatness one cannot altogether put out of court those five palaces in his Via Nuova which he may have designed, and for which much credit has already been assigned to him. They are the Palazzo Brignole Sale (No. 18, also called the Palazzo Rosso from its being painted red), the Palazzo Adorno (No. 10), the Palazzo Giorgio Doria (No. 6), the Palazzo Serra (No. 12), and the Palazzo Spinola (No. 5).

It would be interesting to know definitely to what extent we owe this series to Alessi's genius—they must certainly have been the work of men inspired by his spirit and probably working under his direction. Each of them has its own characteristics; the rustication is varied; the windows are differently grouped. Many of them still retain their magnificent interiors, and the gilding of one saloon alone in the Palazzo Serra is said to have cost a million of francs. This particular palace, with its white marble reliefs, caryatides, mirrors, and mosaic pavements, became known, in fact, as "The Palace of the Sun."

In estimating these palaces by Alessi and his school we must not omit some reference to another important art movement which was in progress in Genoa, and which was also rapidly tending towards Baroque.

We have already found that painters and craftsmen did much to foster such a tendency. Before the middle of the XVIIth century there were many buildings in Genoa whose chief decoration was the fresco-painting on their external walls. This fashion was greatly

developed by Giovanni Battista Castello, Bergamo, who died in 1576, and who was close friend of Luca Cambiaso. He brought with him to Genoa the Lombard taste for luxurious and all-pervading ornament. Not only were his façades painted with figures as symbolic objects, but the same features were reproduced in modelled plaster—at first in low relief, then gradually becoming so rich and boldly executed that they proclaimed the advent of a new manner in architecture. We may see his style in the Palazzo Careg Cataldi and the Palazzo Raggio-Podestà both in the Via Nuova; but best of all perhaps in the Palazzo Imperiale, where the ornament is in high relief. This palace, thoroughly and unmistakably Baroque of strong and attractive variety, yet is as early as 1580. Of the same character, if not by the same hand, is that charming façade of the Palazzo Pallavicini in the Salita Santa Caterina, an alley so steep and narrow that one cannot view aright the groups of charmingly carved goddesses and garlands that seem so misplaced in such a situation.

Yet another contemporary of Alessi's again a Lombard, was Rocco Lurago, who died in 1590, and who will go down to posterity as the author of one of the largest and most imposing palaces in Genoa—the Palazzo Doria-Tursi, now known as the Municipio. And, though all authorities seem to date this building as early as 1566, we can have little hesitation in classing it as Baroque example. For throughout its vast bulk we find a spirit utterly alien to that of the Renaissance. Niccolò Grimaldi, for whom it was built, was called "The Monarch by reason of his power, and there is power, wealth, crushing importance in every line of his great mansion. We see Baroque writ large in its very proportions—extolling size for its own sake—in the heavy and colossal cornice, in the coarse mouldings of the giant masonry, as well as in the wonderful originality of the flanking loggie and the unusual design of the ornamental features. The same could be said in a less degree of the interior courtyard, for, in spite of the Doric Order and a general air of simplicity, we feel

are in the presence of something in no way akin to the art of Bramante and Peruzzi.

Let it not be said that we are over-archaeological, for we admit Baroque building here in Genoa of 1560, and refuse to recognise Alessi as a Baroque practitioner, though most of his great works date from the sixteenth century.

The Palazzo Doria-Tursi in view of its size alone exercised as much or more influence on the city than the work of Alessi or Castello, and taken as a whole, its good points balance its defects.

Passing over the Palazzo Bianco, built a few years later almost opposite the Doria-Tursi, we come to the work of the greatest Genoese architects, perhaps to us to-day the greatest of his century in Italy, Bartolomeo Bianco. We know little of his early life, but that some time early in the XVIIth century he was working in Genoa. Like his brother, he occupied the position of Official Architect and Engineer to the Republic, and this was after he had gained a great reputation by his work for the Balbi family. After a few years he resigned the care of the fortifications to other hands and devoted himself exclusively to those wonderful palaces which have made him famous for all time. They are but three in number, and they all are situated in the Via Balbi. This street was laid out after the Via Nuova, and was made much wider, for the former, which he praised though it be, is sadly too narrow. They were connected by various passages, and by the short Via Nuovissima (now Via Cairoli), in a sort of town-planning scheme which extended from the Palazzo Doria to the Piazza Fontane Marose, and which was largely due to Alessi.

Bianco's first palace commission was for the Palazzo Balbi Senarega, commenced in 1609. The exterior is severe to bareness, and is a striking contrast to Alessi's vigorous Baroque.

The interior is also severely simple, but simplicity does not of necessity imply conventionality, and where but in the Baroque would we find these docketers on the columns from which the graceful scrolls spring? This wonderful vista, too, through the courtyard and staircase hall, out through the garden, to a rococo grotto with its marble giants and a sparkling fountain to end the view—is this of the Renaissance or the Baroque period?

Almost opposite stands the immense Palazzo Durazzo Pallavicini, commenced seven years later and before the Palazzo Balbi was finished, so that Bianco handed the latter work over to a pupil and devoted himself to preparing plans for his new commission. This enormous palace has fortunately been very greatly altered since it was built, but an old engraving enables us to picture it as its designer first built it. He adopted Rocco Lurago's scheme from the Doria-Tursi—a lofty central block flanked by open loggias, all standing on a basement; but so colossal was his scale that the basement is three stories high. His governing cornice was huge in proportion, and his detail justifies us in accounting this Baroque work. His windows are simply rectangular openings, devoid of even an architrave, but the doorway, the balcony over it, and the main cornice are exuberantly Baroque.

The interior courtyards of this palace and the neighbouring Università, begun in 1623 for one of the Balbi as a Jesuit College, are to an architect the finest thing in Genoa, and the finest piece of staircase planning in Italy. Theatrical and ostentatious they may be christened by some, but not to any one critic, who sees in their dignified simplicity (marred by no superfluous ornament) the highest achievement of Alessi's great Genoese tradition.

After Bianco's death, in 1654, few important palaces were built. The enormous Palazzo Reale in the Via Balbi was in progress at the time, but its Lombard

architect, G. A. Falcone, died of the plague three years later, and was succeeded by Pier Francesco Cantone. It is, however, of little importance to students of our period, nor for that matter—except also on account of size—is the huge Albergo dei Poveri, magnificently placed on the hill behind the city, which it commands like a fortress. Built by four different architects between 1655 and 1675, it was given to the Republic by a wealthy citizen, Emanuele Brignole. It holds 1,300 inmates, and it is said that all of them can witness the celebration of Mass in the chapel without leaving their beds.

Besides the great town houses of Genoa which we have discussed in some detail, by reason of their celebrity and importance, there remain those beautiful villas on the coast, grouped round San Francesco d'Albaro and Sampierdarena, or on the hills overlooking the fair city itself. Here, before ugly industrial suburbs crept out beyond the city walls and deluged the pleasant gardens with smoke, the XVIIth-century nobility and merchants went in the summer to enjoy the cool sea breezes and the lovely views of the Riviera hills. And in their grounds rather than in their buildings, in the succession of terraces, fountains, and balustrades, in the ordered relation of villa to garden and garden to bosco, we find, as we did at Frascati, the very embodiment of Baroque, "Art adorned by Nature." Some of the villas are of Alessi's school and Baroque only in their setting, though with the picturesqueness that distinguishes him from his predecessors. The Villa Paradiso is, one imagines, of later date, and the exterior at any rate is an excellent example of our period, though wedded more closely than usual to classic tradition.

It should be remembered in criticising this architecture in Genoa how many of her gardens were laid out in this style, most notable of all those of the Palazzo Doria, without which that stately mansion would to-day lose its principal charm to a visitor.

Of churches we have said little, for the Baroque churches of Genoa are of slight importance compared with those of Rome, whereas her palaces are of great value for purposes of comparison.

In this article, too, history has been left severely alone, for it concerns us little. Genoa in the XVIth and XVIIth centuries was, as she is now, a great port, but she was also a great power. Her strength lay in the skill of her seamen and the financial genius of her merchants. There was a time when Genoa and Florence financed the greater part of Italy and Spain, and when Spain depended for her existence in the Mediterranean upon the Genoese navy; the time, too, when her immense influence was weakened by the internal struggles of the people against the nobles, and in a less degree by the quarrels of the nobles among themselves for precedence. And this epoch corresponds with the Baroque period in architecture.

We might have chosen Milan or Florence as the central point for this article, but in Genoese buildings we have something akin to nothing else in Italy, something forming a distinct type. Alessi, Castello, Lurago, and Bianco are little known to English students of architecture, and they merit a wider publicity. It is at least as important to study the masterly planning of these great architects—their palatial staircases, their appreciation of the possibilities of sloping ground, their eye for a vista, their sense of dignity—as to laboriously measure Peruzzi's mouldings or to trace the true aesthetics of Brunelleschi's dome. Genoa has been too often ignored by art critics for fear it should contain some "germ of the baroque corruption"; that reason alone should make it well worthy of a visit.

Turin.

Most travelling Englishmen are familiar with the well-ordered streets of Turin, recalling to them the plans of those modern cities across the Atlantic where architects think in "blocks."

But Turin is unlike the rest of Italy, and lacks its particular charm of picturesque and unexpected grouping. It is apparently recently laid out, yet we can trace the whole secret of its plan to the small nucleus formed when the Romans founded the "city of the Taurini." Since those distant days it has had its ups and downs, but until the XVIIth century it was of little

Chiesa Reale di Superga, Turin.

Filippo Juvara, Architect.

[Photo, by Bragg.]

importance in any way. Then the Dukedom of Savoy, destined later to become the maker of United Italy, began to assert itself among the Powers of Europe and to be a source of constant trouble to France and to the Empire. The fact that it strayed over the Alps accounts for much of the French influence that permeates its architecture.

The most striking fact about Baroque architecture in Turin is that, except for a few minor remains of mediæval or of Roman date, its XVIIIth-century buildings are its oldest monuments, and that, thanks to the constant progress of its rulers at that time, it has so fine a series of palaces and churches that they constitute in themselves all the noteworthy art of the place.

Of those most worthy of comment the earliest is the Castello del Valentino (1633), a large palace which was erected by Christine of France, the wife of Victor Amadeus I., and daughter of Henri Quatre and Marie de Medicis. This relationship is mentioned as explaining the very Gallic style of this *château*, and also the employment of a French architect, whose name is apparently not recorded, but who seems to have been a pupil of the celebrated Salomon de Brosse. This forms perhaps the first example we have met of foreign influence affecting the Baroque style, which was essentially an Italian movement emanating from Rome. In subsequent chapters, however, the entrance of Spanish ideas will be noticed, for in Spain there already existed an exuberant variety of Renaissance work which bore the title of "Plateresque." Returning to Turin, we find in spite of a French tendency in these pavilion roofs and arched *loggie* round the forecourt that most of the detail is Italian in spirit.

The Baroque buildings of Turin are almost all the work of two architects who were the favourites of Charles Emmanuel II., who died in 1675, and his successor, Victor Amadeus III. (1675-1730), who became King of Sardinia.

Guarino Guarini was a Theatine monk, born at Modena in 1624 and dying in 1683 or thereabouts. His Palazzo Carignano (1680), which is illustrated here, is perhaps his most important commission, and unfortunately exhibits most of the vagaries and weaker points of the period. Lack of space prevents us publishing the fantastic plan of the central feature, which consists of halls and staircases. The principal vestibule, oval on plan, faces into a courtyard, and may be seen carried up above the main cornice in our plate. This palace has played an important part in the history of Savoy, and the famous King Victor Emmanuel II. was born here.

Guarini's work also included San Lorenzo (1634) and La Consolata (1679) among the better-known churches of the city.

Filippo Juvara (b. 1685, d. 1735), who hailed from Sicily, was a man of more restraint, and, besides his alterations at the Royal Palace, is responsible for two of the greatest works of his period.

The Palazzo Madama (1718-20) has a magnificent front which, though free enough in minor matters of detail, is, as a whole, a masterly piece of virile classic design. It was, as its name proclaims, built for the Dowager Queen in the reign of Victor Amadeus II., and in reality forms only a third of a scheme for encasing the older palace of mediæval times. The other two sides have now been completed, but much work was done within the building, of which the illustration gives a fair idea. The manner in which a wide landing is obtained by means of brackets over a narrower vault of one bay is worthy of notice.

Juvara's masterpiece is undoubtedly the great votive church of The Superga (1717-1731), erected on a lofty hill some miles from the city in fulfilment of a vow made by Victor Amadeus II., in 1706, to build a church to the Virgin on this spot when the invading troops left the city. The curious name is said to be Latin in origin, and to signify "on the back of the mountains"

(*super terga montium*). The interior is circular, with six elliptical chapels and an octagonal chancel opposite the entrance. One of the finest examples of Baroque architecture extant, this church should be visited by every architect who finds himself in Turin.

M. S. B.

GENERAL NEWS.

Professional Announcements.

Mr. William W. Dearnley, quantity surveyor, is removing into new offices at No. 13, John-street, Adelphi, W.C.

Mr. Conrad B. Willocks, A.R.I.B.A., of Reading, has removed from Broadway-buildings to 11, Friar-street, Reading.

H.M. Office of Works.

By reason of continued ill-health Sir Schomburg Kerr McDonnell, K.C.B., G.C.V.O., F.R.S.A., has resigned his appointment as Secretary to H.M.'s Office of Works, which he has held since 1902. Sir Schomburg McDonnell, a son of the late Earl of Antrim, is a member of the Royal Commission on Historic Monuments, and was educated at Eton and Oxford. He saw service in the South African campaign as captain in the 1st London R.B.V.

King's College Hospital and its Site, W.C.

The Committee of King's College Hospital are about to dispose of the freehold site and the buildings of the hospital, covering an area of 48,200 ft. superficial, an island site, with frontages to St. Clement's-lane, Grange-court, and Carey and Portugal streets. In pursuance of an Act of 1851 the area on the north side of Grange-court, including the old Grange Inn at the north-west corner of Carey-street, and nearly all the burial-ground known as the Green, or Upper Ground, was acquired for the new buildings of the hospital, which had been established in the adjacent workhouse in Portugal-street, south side, in 1839. The hospital was begun in June, 1852, for 220 beds, after Thomas Bellamy's designs and plans selected in a limited competition by the assessor, Professor Hosking. M. Armand Husson illustrates the plans in his "Étude sur les Hôpitaux," 4to, Paris, 1862. The west gate of the forecourt marks the site of the parish watch-house; the forecourt is part of the Green Ground, St. Clement Dances.

Public Health.

The opening of the Charing Cross Hospital Medical School on October 31 will be signalled by the inauguration of an extensive range of new laboratories lately fitted up in the Medical School Buildings in Chandos-street for the Public Health and Bacteriological Departments of University of London, King's College. The accommodation provided comprises a large lecture theatre and library, two large class laboratories, research, professors' and lecturers' laboratories. The work will be in the hands of the staff of King's College, and the courses for the Diploma of Public Health and Research and investigations for public bodies and others hitherto carried on at King's College will be continued in the new laboratories after the 7th inst.

Church Congress, Middlesbrough.

To the Ecclesiastical Art Exhibition of the Church Congress, opened on September 28, are contributed some fine specimens of church plate, many of which bear York and Hull assay marks of the XVIIth and XVIIIth centuries. Amongst the exhibits are the Goathland chalice, of date circa 1450, with others from Adwick, 1579, and Todwick, 1684, and Old Hutton, Westmorland, of, it is believed, about 1450. There are also lent a remarkable collection by Mrs. Warde-Aldam of Yorkshire monumental brass rubbings and an early XVIIIth-century stole. At the Congress, papers were read on the Housing Problem by the Bishop of Wakefield and Mr. Raymond Unwin, F.R.I.B.A.

Mediæval Architecture.

Mr. Banister Fletcher, F.R.I.B.A., gave on Monday last the first of his course of University Extension Lectures on "Mediæval Architecture" at the Victoria and Albert Museum, South Kensington, S.W. He referred to architecture as a visible exponent of civilisation uniting and embracing the other arts, and pointed out that all modern design was founded upon old art, although altered in order to conform to existing conditions. Architecture being the basis of all design, a knowledge of it

was necessary to designers and art students and was also of use to a much larger circle which practically included the whole community. The author and novelist required knowledge of the subject for the setting up of a historical novel, because a mere story to people without reference to the buildings inhabited was uninteresting and insipid. The teaching profession now realise that to make history interesting the student should be taught not only what men did, but what they made not only that they fought battles, but what sort of buildings they lived in and the church they erected for the worship of God.

Particulars of the course can be obtained from the Hon. Secretary, 10, Woburn-square, W.C.

University Extension Lectures.

At the British Museum and at the Victoria and Albert Museum twenty-four lectures on "Greek Art and National Life" and twenty-four on "Five Centuries of Decorative Art (1050-1550)" will be delivered on Tuesdays and Thursdays by Mr. S. C. Kaines Smith, M.A. (Cantab). Particulars of the courses, which are in connexion with the University of London, may be obtained from Miss Gaudet, 120, Cheyne-walk, Chelsea.

Annual Report of the Commissioners of Woods and Forests.

The Commissioners have recently issued the ninetyeth Report, in which they set forth the total receipts for the past twelve months amount to 703,300l., whereof more than 376,000l. (as net income) were derived from properties in London, and out of which amount the paid into the Treasury 530,000l. as compared with 500,000l. for the last preceding period. The Crown property now in their charge exclusively of land let for building purposes, comprises 340,800 acres, of which about 67,574 acres are used for the growing of timber. They expended 131,666l. in buying new properties, chiefly in England, they sold estates and "unimprovable rents" for an amount in value of 94,530l. Of the Crown lands—an aggregate of 65,000 acres—in New Forest, the woods, open and enclosed, cover some 23,760 acres; the maintenance of Windsor Park and woods cost 32,372l., the income from all sources was but 6,302l. The Commissioners have granted to the Royal Automobile Club a fresh lease for ninety-nine years, from January 1, 1908, of the site in Pall Mall (formerly that of the War Office) at 7,500l. per annum, after the fourth year, and expenditure on erecting buildings. They have exchanged property in Regent-street, Cavendish-place, and Langham place to Lord Howard de Walden for premises owned by him in Oxford, Princes, Margaret Great Castle, Great Portland, and Little Portland streets. Whilst most of the agricultural land consists of large farms, the Commissioners have in the past six years created small allotments and holdings to an aggregate of 7,524 acres.

Celluloid and Petrol Dangers.

The British Fire Prevention Committee opened its autumn session on the 25th ult. with a series of twenty tests with ordinary celluloid cinematograph films *versus* a non-inflammable celluloid film, and by a series of some twenty-five tests as to the possibility of extinguishing petrol fires, celluloid fires, and similar outbreaks by the application of chemical foam. The numerous visitors were received by the Chairman of the Committee (Mr. Edwin O. Sachs, F.R.S., Ed.), the Earl of Londesborough, K.C.V.O., Sir John Cockburn, K.C.M.G., Major Cooper-Key (Chief Inspector of Explosives), and other members of the Council. Reports on the subject will be issued by the Committee in due course.

Sherbourne Hall Farm, Sandringham.

The King has just purchased this property of about 650 acres, for addition to his Sandringham estate. The farm lands lie to the north of Sandringham and on the east and west sides of the village, and their purchase renders the King owner of all Sandringham parish. The Sherbourne property retains the fine Tudor house, the Hall, with parts of the moat, and the estate belonged for six hundred years to a family whose last representative, Francis Sherbourne, bequeathed it, in 1654, to Emmanuel College, Cambridge, of which the Master and Fellows sold it to the King for, it is said, about 12,000l. The church is reputedly the second founded by Bishop Felix, in East Anglia, and was built by Thorpe, lord of Sherbourne.

ILLUSTRATIONS.

The "Lee's Rest Houses," Hull.

A COMPETITION was held recently in Hull among local architects and a limited number of others to obtain the best design for rest houses to be built under the will of the late Dr. Lee. Mr. Edwin Cooper, F.R.I.B.A., the assessor, selected the scheme of Mr. Henry T. Hare, whose drawings are reproduced in this issue. The work is now being carried out.

From Mr. Hare's report, sent in to the committee with the design, we extract the following:—

"The buildings have been arranged on the site in the form of a great quadrangle, as suggested. Interest is added to the arrangement by four subsidiary courts, or quadrangles, at the corners. Special attention has been given to the question of aspect, all the dwellings (except those in the entrance block) facing east and west, thus ensuring sun in all the rooms at some period of the day. It has also been considered desirable to so arrange the plan that the quadrangle should be as quiet as possible and free from unnecessary traffic; and, with this object, a cart-road is provided into it. The dwellings have been planned in blocks of eight, as suggested, with an entrance and staircase to every pair of rooms. This division into small blocks militates somewhat against a very satisfactory architectural treatment, and it is felt that some improvement in this respect might be effected if the three blocks on each side of the quadrangle were combined into one large block, to greatest economy has been exercised in the tails of the planning, consistent with convenience and efficiency.

The total number of dwellings shown on the plan is 119 in addition to provision for caretaker and superintendent. The laundry is ranged in the rear of the site, and the blocks of buildings are so placed that the drying ground is entirely screened from view both from the roads and quadrangle. Shelters are ranged in various places between the blocks of dwellings and in the centre of the quadrangle. The buildings would be faced with handmade red facing bricks, and the roofs covered with tiles. The staircases, landings, etc., to be of fireproof construction. It is suggested that the whole of the joinery should be of wainscot in order to avoid periodical painting. The hot-water supply is worked from a boiler placed in a small basement under the laundry block, the supply pipes being carried round the quadrangle to the various blocks in a trench or subway. The small amount of heating required in the central block would be connected to the same system."

Baroque Architecture.

THE fourth article on Baroque architecture begins on p. 376, and the illustrations forming one of our plates are in connexion with it.

MEETINGS.

FRIDAY, OCTOBER 4.

Royal Sanitary Institute—"Elementary Statistics," by Mr. J. Priestley, B.A., M.D. 7 p.m.

MONDAY, OCTOBER 7.

The Society of Engineers. Mr. E. B. Matthews on "Town Planning from an Engineering Aspect." At the Institution of Electrical Engineers, Victoria Embankment. 7.30 p.m.

TUESDAY, OCTOBER 8.

Royal Sanitary Institute—Mr. Alan E. Munby, M.A., A.R.I.B.A., on "Elementary Science: Physics, Chemistry." 7 p.m.

WEDNESDAY, OCTOBER 9.

Manchester Society of Architects.—Presidential address. 6.30 p.m.

Royal Sanitary Institute—Mr. Alan E. Munby, M.A., A.R.I.B.A., on "Elementary Science: Physics, Chemistry." 7 p.m.

FRIDAY, OCTOBER 11.

Royal Technical College, Architectural Craftsmen's Society, Glasgow.—Mr. A. N. Paterson, M.A., on "Scottish Architecture: XVIIth to XVIIIth Century."

The Institution of Municipal Engineers. Annual general meeting.

COMPETITION NEWS.

A list of current Competitions is printed on page 396.

Fire Brigade Station, Cardiff.

A review of this competition, won by Messrs. E. Vincent Harris & T. A. Moodie, appears on p. 391.

Library, Glasgow.

A branch library is to be erected at the corner of Baidlefield-road and Sinclair-drive, Langside, and the Glasgow Corporation have issued particulars of an open competition. Mr. Alex. N. Paterson, A.R.S.A., is the assessor.

The Housing Problem in Toronto.

The Toronto Housing Company recently issued invitations to Canadian architects to compete for laying out a site and designing and erecting a large number of houses on land recently purchased by them facing Logan-avenue. The intention was to form an attractive garden city where houses of varying rentals and accommodation could be obtained. The competition was divided into three heads, each division being for houses of particular accommodation and rental. Mr. Leonard Martin, F.R.I.B.A., of 17, Waterloo-place, Pall Mall, London, in conjunction with Mr. Sydney V. Kendall, also competed, and won all three premiums. It is expected that the work will be put in hand forthwith.

CORRESPONDENCE.

Lesnes Abbey Excavations.

SIR,—In your issue of October 15, 1910, you noticed the work, then partly executed, of the Woolwich Antiquarian Society in tracing and uncovering the buried remains of the great Augustinian Abbey of Lesnes, just on the Kentish border of London at Abbey Wood. I now desire to inform you that the operations are nearly complete, and that, with valuable expert assistance, and under the advice of many well-known archaeologists, the whole of the foundations have been laid bare and carefully planned, various important discoveries being made in the process.

We have numerous relics for which we shall soon be seeking suitable and permanent homes available to the public. The effigy of a knight in complete armour and richly coloured has already been placed in the Victoria and Albert Museum at South Kensington. The figure dates from c. 1310, and is believed to represent a De Luci of Newington, a relative of the abbey founder, Richard de Luci. There are also

brass casements of remarkable patterns and monumental slabs with inscriptions, one of which bears the name of Avelina, probably the founder's daughter.

Rather more than 2000l. has been expended, and, as there is little hope of purchasing and preserving the ruins it is contemplated to close down the works shortly and restore the site to its former level. At the same time we hope to issue a full and final report, but before the remains disappear there is yet opportunity for interested visitors to see what has been done. Work is now restricted to Saturday afternoons, and one of the Committee will always be available to conduct parties round at three o'clock.

In case any wealthy benefactor or Corporation should desire to save the old Abbey from reinterment, and eventual extermination by the house-builder, it is estimated that the cost of purchasing and preserving the requisite area of about three acres will probably be from 8000l. to 1,0000l.

W. T. VINCENT,

President, Woolwich Antiquarian Society.

Architects' and Surveyors' Approved Society.

SIR,—I shall be glad if you will kindly grant me a short space to remind those who have applied for application forms for membership of the above Society that it is advisable that these forms should be filled in and returned at once, so that cards for the ensuing quarter (commencing October 13) may be issued to them. The daily additions to the membership list are exceedingly gratifying, but there are many persons connected with the architectural and surveying professions who are not yet

members of any Society for the purposes of the Insurance Act, and I would urge them to apply for membership forms at once, as it is hardly necessary to point out that it is to their interest to join a Society which has been formed solely for their benefit.

F. R. YERBURY,

R.I.B.A. SESSIONAL MEETINGS, 1912-13.

The following papers will be read at the Royal Institute of British Architects during the session:—November 18, "Bath and Wells," Mr. J. L. Ball; December 16, "The Walls of Visby, Gotland," Mr. Horace Porter, M.A. Cantab, A.R.I.B.A.; January 20, "Canadian Architecture," Mr. F. S. Baker, F.R.I.B.A. (Toronto); February 17, "Modern Hospitals," Messrs. A. Saxon Snell and William Milburn; March 17, "Modern French Architecture," Mr. F. Billerey; April 7, "American Museum Buildings," Mr. Cecil Brewer, F.R.I.B.A.; April 21, "Modern Steel Construction," Messrs. F. N. Jackson and Bernard Dicksee, F.R.I.B.A.; May 26, "Modern Architecture," Mr. Thomas Hastings (New York).

FIFTY YEARS AGO.

From the *Builder* of October 4, 1862.

Explosions of Copper Gaspipes.

SOME time since it was discovered that when gaspipes constructed of copper or bronze have been long submitted to the action of ordinary coal-gas an explosive compound of copper and acetylen (one of the many ingredients of coal-gas) is formed. When dry, this compound detonates with extraordinary violence as soon as it is rubbed, struck, or heated. Accidents have occurred and workmen have lost their lives while cleaning large copper gaspipes from this circumstance. No such explosive compound appears to be formed when iron or lead is used. Dr. T. L. Phipson, of Putney, writing to the *Times* recently on this subject, draws renewed attention to the fact that large copper gaspipes are unsafe, and that some other metal should be substituted for the copper.

** When the above was written chemists were only beginning to understand the many complicated forms and combinations of the hydro-carbon compounds, hence the reference to "acetylen" as one of the many ingredients of coal-gas. It was not until the year 1895 that acetylene, as we now know it, was made a commercial article, owing to the advance in electro-chemical industries, but since the introduction of coal-gas at the close of the XVIIIth century it had been found that among the impurities (so-called) found in coal-gas there were a series of hydrocarbon compounds known as the acetylenes which possess the noteworthy property of forming metallic derivatives, a property found only in this class. In combination with brass, copper, and bronze, these metallic compounds were found to be explosives, and when it became necessary to clean out the large tubes where copper was used for mains, accidents by explosion frequently occurred; numerous instances are recorded where even the turning of a brass tap has been the exciting cause, and an explosion more or less alarming has followed.

When acetylene was first introduced it was feared that danger accompanied its use owing to the explosive acetylides formed when in contact with copper (and even silver), so that copper for distributing mains and tubes has for many years been rigidly excluded in the modern gas installations. In the case of coal-gas, where perhaps only 1 per cent. of acetylene may be present, such dangerous compounds were formed in the case of copper mains, and modern practice has adopted nothing but iron pipes and mains for distribution of town gas.

But owing to recent improvements in the manufacture of calcium carbide, and rigid attention to the purity of the raw materials, as well as to the actual period of action of the electric arc in fusing the carbide, nearly all impurities are removed, and the fear of danger from the acetylides has been very largely allayed, so that brass and copper are being employed again, and ordinary gas-fittings may now be used almost with impunity.—Ed.

PROTECTION OF BUILDINGS FROM LIGHTNING.

Mr. Alfred Hands, M.Inst.E.E., who has lectured before the Architectural Association, has issued from 91, Leadenhall-street, E.C., a synopsis of his lectures and a list of his engagements in various parts of the kingdom.

ARCHITECTURAL ASSOCIATION MEETINGS, 1912-1913.

It is announced that the following papers will be read at the Architectural Association:—October 28, "Small Country Houses of To-day," Mr. Lawrence Weaver, F.S.A., Hon. Sec. A.R.I.B.A.; November 11, "Marbles Used in Greek, Roman, and Byzantine Buildings," Mr. J. A. Marshall; November 25, "The Prosais in Architecture," Mr. Horace Cubitt, A.R.I.B.A., F.A.S.I.; January 27, "The Architecture of Dublin," Mr. R. Caulfield Orpen, B.A., F.R.I.B.A.; February 26, "A.A. Excursion to Shrewsbury and District, 1912," Mr. Edwin Gunn, A.R.I.B.A. Professor W. R. Colton, A.R.A., will read a paper on January 13, and Professor Lethaby one on February 10.

"BAROQUE ARCHITECTURE," IV.

MONTHLY REVIEW · of · CIVIC DESIGN.

Monument to Jean-Jacques Rousseau in the Panthéon, Paris.

M. Bartholomé, Sculptor.

(From the *Gazette des Beaux-Arts*.)

MONUMENTS AND THE IDEAL.

ALTHOUGH civic design may be thought to concern itself more with the placing and disposition of memorials to the dead than with their actual features and details, such monuments cannot be properly related to their environment unless it also concerns itself to some extent with their character and general conception.

It is generally recognised, we suppose, that a successful town plan involves the consideration more than the plan. It must be conceived the solid; in three dimensions, not two alone. It must exercise a control, not only over the grouping of the buildings, but also over their size, their shape, and their general character. From its control memorials to the dead are not exempt.

From the ideal point of view there is but one—*one* and indivisible. If an arbitrary line must be drawn between town planning and architecture, or between architecture and sculpture, if no one individual creates and controls both the broad lay-out of the city and every detail of its construction, it is only for the sake of convenience—a concession to the limitations of the individual to the weakness of human nature and the shortness of life. From the conception of the whole city as a group of buildings—each building a group of units so ranged and related to one another as to express the corporate life—to that of the sculptural monument, its figures so grouped to express one phase or aspect of that life, to design, architecture, sculpture, and decorative painting all melt into one organic

conception dominated by one creative and controlling idea.

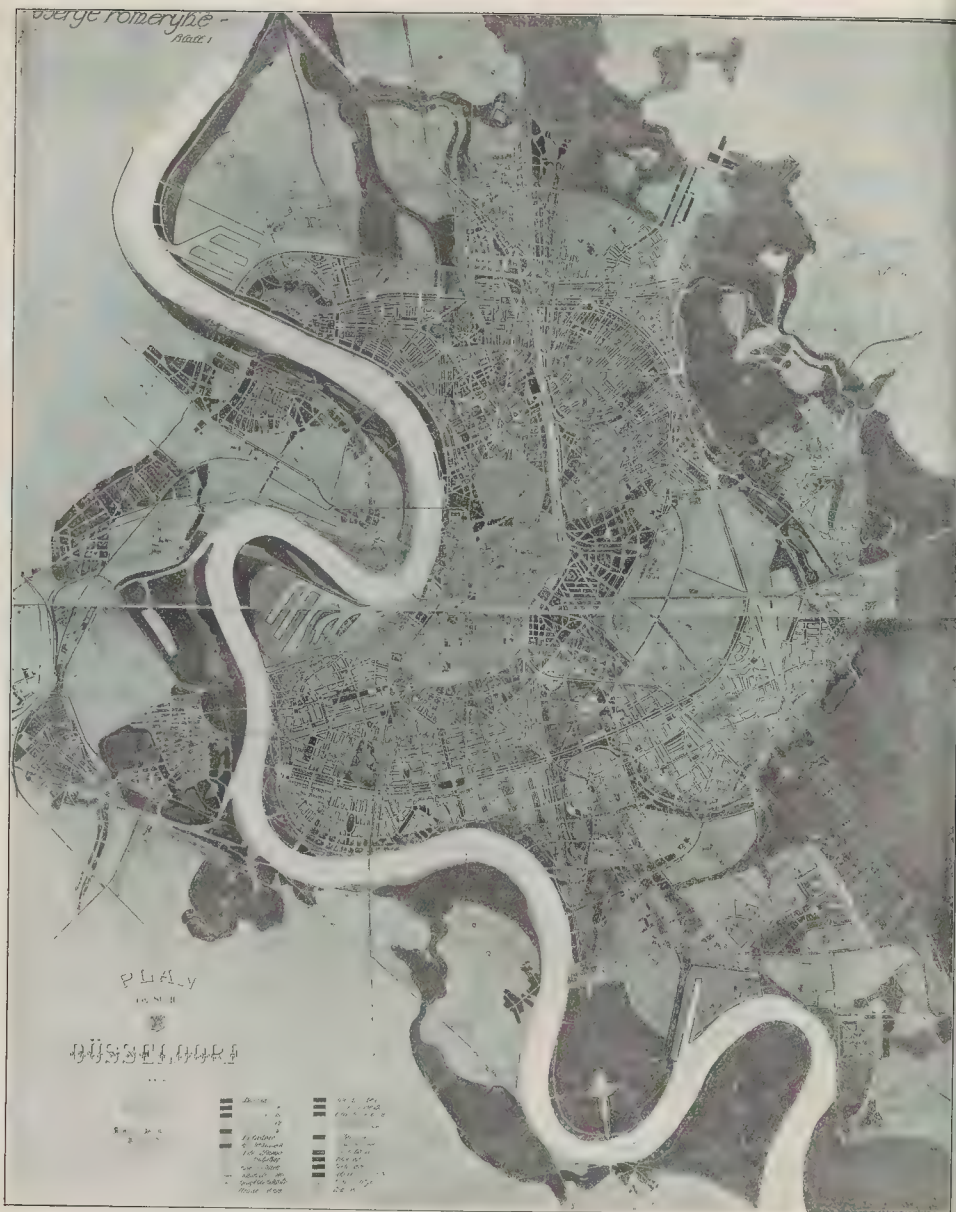

If, then, an isolated monument in the centre of garden or square, detached more or less from its architectural environment by space and atmosphere, by the play of light on fountains and trees, by the movement of the traffic, has yet a due relation to it, how much more intimate is this relation when the monument placed in the interior of a building is completely enclosed and dominated by pure architectural forms! Here, if anywhere, the controlling idea should prevail, and architecture and sculpture be one.

Architecture, being an ideal art, would seem to find no room for realistic imitations of nature; but to demand a correspondingly ideal outlook from the sculpture which intensifies or completes its expression. Although in park or garden such realistic memorials as portrait statues might perhaps be so isolated as to make any absence of harmony unnoticeable, the more closely they are associated with conventional architectural forms the more some feeling for the ideal seems necessary. A monument may be rightly placed in accordance with its meaning and sentiment; in itself it may be complete and fitly express this sentiment; it may be true in scale, composition, and other technical qualities with its architectural surroundings; but beyond all this a higher note appears to be struck, a more perfect relation established when the same exalted ideality of conception informs and animates them both.

It well might have been that the sculptor

commissioned to place in the Panthéon a national monument to Jean-Jacques Rousseau would have contented himself with the obvious expedient of a portrait statue as the dominant feature of his composition, a representation of the corporeal presence, the actual bodily form of the philosopher—idealised in treatment, maybe—but nevertheless realistic in conception. But to the creator of the Monument aux Morts the imaginative, the spiritual, the abstract has made a stronger appeal. Not the mortal body, but the immortal soul of Rousseau inspires his art. Not the graces or achievements of the perishable flesh but of the imperishable spirit are symbolised here in the shrine which France has dedicated *aux grandes hommes La Patrie reconnaissante*. Where in a composition less ideal we might look to find a portrait figure of Rousseau as he lived and moved among his fellows sits an abstract figure of "Philosophy," supported by "Truth" and "Nature"; while on one side of the tomb chants the muse of "Poetry," and on the other "Glory" holds aloft the crown of immortality over the portrait medallion on the grave below.

Although it may not be for those of a different race to attempt to gauge with what measure of success M. Bartholomé has symbolised the genius of Rousseau as it is felt and understood by his own countrymen, nor to say how far this monument fitly expresses the homage of France to one of the greatest of her sons, all may feel the spirituality of conception lifting it on to the abstract plane of architecture.

Town-Planning Competition at Düsseldorf: Winning Design, by Professors Bruno Schmitz and Blum.

TOWN-PLANNING COMPETITION, DÜSSELDORF.

WHEN publishing a translation of the conditions of this competition we referred to their interest and importance as setting forth the main features of a good town plan and as illustrating the position to which the art of town planning has attained in Germany.

We now have the pleasure of publishing the winning design submitted in competition by Professor Ing. Bruno Schmitz, of Charlottenburg, Berlin, and Professor Dr. Ing. Blum, of Hanover.

Our readers may remember that the conditions asked for a plan for building up the town of Düsseldorf to satisfy the requirements of traffic, public health, administration, and beauty. The existing building scheme was to be retained as far as practicable, but the necessity for revision was to be borne in mind and suggested alterations shown. Suggestions were to be made for the extension and supplementing of existing streets and means of communication, and sites were to be provided for residential and industrial quarters, taking into account such questions as road and water communication, prevailing winds, points of the compass, parks, and forest lands. The scheme of roads, tramways, and railways was

to be extended to various smaller commercial districts around, while allowing for a possible linking up with the surrounding large towns. Suggestions were also to be made for open spaces both in Düsseldorf itself and in the various extensions. The whole subject was to be discussed in a report.

Numerous different points to be observed by the competitors formulate the scheme in greater detail, and those of our readers who would wish to refer to them for comparison with the plan will find them in our "Monthly Review of Civic Design" for September 29, 1911. The names of the successful competitors were published on August 9, 1912.

**TOWN-PLANNING
COMPETITION, REIGATE.**

THE Reigate Lodge estate having come into market, it was purchased by the Council in order that they might develop it in conformity with modern ideas, and to prevent it being parcelled out with small houses. The estate comprised 28 acres, and the purchase price was £500. Application was made to the Local Government Board for a loan of £15,000 for the carrying out of the scheme. Eight acres were reserved for the new grammar school and playing-fields, 2 acres were to be devoted to a town depot, new roads which the Town Council had in mind at the time took off 2 acres, 2 acres might be required for a new public elementary school, whilst negotiations have been going on for the sale of a portion of the land to the S.E. & C.R. Company for the purpose of providing increased accommodation for Reigate Station. This left about 11 acres to be dealt with, and a competition was arranged, in which Mr. Raymond Unwin, F.R.I.B.A., was the assessor. The winning competitor was Mr. Vincent Hooper, A.R.I.B.A., of Reigate, whose plan is published herewith.

Although the Town Council of Reigate is to be congratulated on its action, it seems rather a pity that the whole of the estate could not have been included in the competition, so that it might have been considered as a whole.

By obtaining the special permission of the Local Government Board to the retention of a fine belt of trees, with the old walls on the north and east, the most interesting amenity of the estate is safeguarded and preserved, and the problem set to competitors resolved itself into a question—how to continue this spirit of preservation and at the same time open up the estate for suitable building purposes.

The winning scheme shows a new road named Hartway, commencing at the corner of Croydon-road and Church-street, and laid on an axial line striking the centre of the front of the old mansion; this length of road to be 40 ft. in width and to be opened out at its mouth to form a safer sweep to the existing streets and allow of a central refuge at a somewhat dangerous corner. Could the boundary of the old of the Open Spaces Society be set back it would allow of the thorough development of this place.

Hartway is shown encircling the house, and

by a side sweep encircling the old elms, and thence turning northward into Rushworth-road. The Corporation's new route to Reigate Station.

A further road called Orchard-road is planned to run north-easterly from the house into the Corporation's new road.

The roads are to be generally 36 ft. wide to the standard of the by-laws. That part 40 ft. in width will be planted with trees and with all possible preservation of the old trees, as suggested on the plan.

The house is shown standing with the main block and west wing upon a reasonable reserve, and with the fine shrubberies and old shelter-house retained; this latter to be dedicated to the public use.

Directly opposite the house front a plot of land some two-thirds of an acre in extent, with lawns, rose trellis, and old trees, is shown as another reserve.

The reserved belt of trees is divided between the south and east walks, and the treatment proposed to the old wall is to cut openings, build piers, and erect white posts, and to form small bridges over the watercourse in Croydon-road. The finest of the trees should be retained, whilst the surface of the ground beneath them would be partly prepared as a gravel path and partly remain as grass.

The land set apart for building purposes is divided into fifty reasonably-sized plots. It is felt wisest to show a smaller rather than a larger plot, as the property must not on any account be set out on too large a scheme of plotting, and at the same time the policy of building houses closely together must be discouraged.

To this end it is proposed that all houses be absolutely detached; that, with reasonable exceptions, no house be built within 5 ft. or so of either boundary; and that some control be obtained over what is erected so that houses be reasonably good in appearance and not objectionable to neighbouring owners.

All trees of value or beauty in the interior of the grounds should be saved, at least for the present, the Council doing any necessary lopping of those near house sites to ensure safety in times of storm.

The author of the design has some confidence that the scheme he presents will not detract from the present exceeding beauty of the estate, and in some respects will add to that beauty by opening up views and distances that are now closed in.

**NEW ROAD FROM EASTHAM TO
ELLESMERE PORT, CHESHIRE.**

A new road is in course of construction between the above places, and, as the map on the next page shows, it is of considerable importance to the neighbourhood, where development schemes are in progress. Briefly, the advantages of the road are:—

1. The distance between Ellesmere Port and Birkenhead will be reduced from 12 miles to 9½ miles.

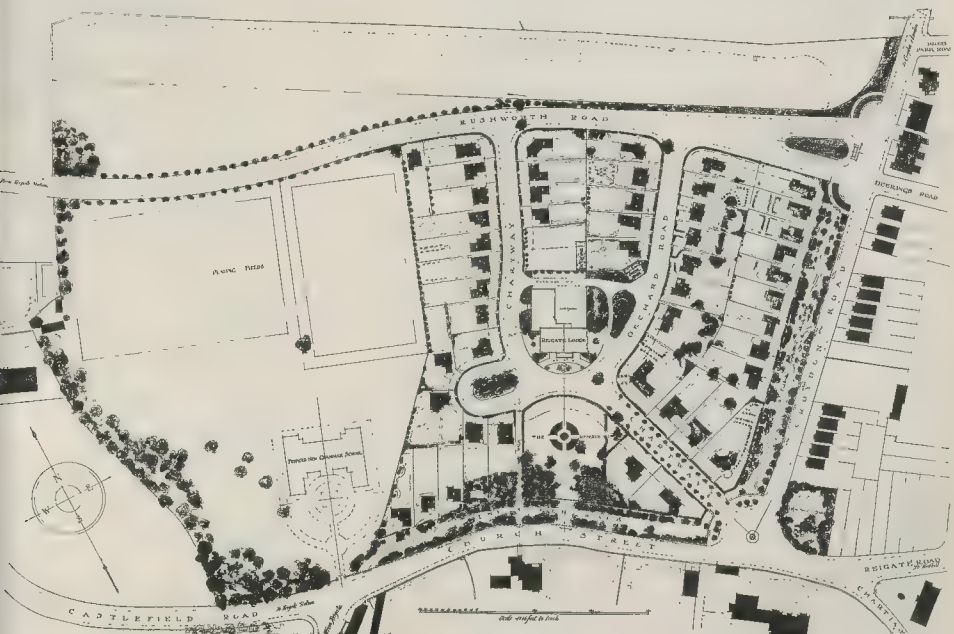

2. A wide, straight, and almost level road will be provided.

3. The road will form a base for town planning throughout its length, that is, a distance of 8 miles, between the village of Eastham and the town of Ellesmere Port.

The town of Ellesmere Port is the terminus of the old Bridgewater Canal, leading from Ellesmere in Shropshire to the River Mersey. A few decades ago it was merely a fishing village, but, following the construction of the Manchester Ship Canal, it became an important junction for the canal system, which connects it to Staffordshire and the Midland Counties.

The Shropshire Union Railway and Canal Company developed extensive basins, built capacious grain silos and railway sidings on the land adjoining the Ship Canal, and gradually industries began to be developed on the banks of the canal, the foremost being Burnells Ironworks, which was followed in later years by the Wolverhampton Ironworks, both works being engaged in the rolling and galvanising of corrugated-iron sheets. Subsequently the erection of flour mills in close proximity to the huge grain silos of the Shropshire Union Railway took place, these being Messrs. King's and the Imperial Flour Mills. Messrs. Frost, of Chester, have erected large and capacious flour and provender mills and, latterly, cement works equipped with the latest machinery, electrically driven.

It will be easily seen that, with the erection of these numerous works and the Canal Company's developments, the best of the available positions in the vicinity of the canal are taken up. In 1909 the Ellesmere Port Local Authority, now an Urban District Authority, decided to extend their boundaries. After the formal procedure of a Local Government Inquiry, the parishes of Overpool and Netherpool, on the northern

Reigate Lodge Estate Competition. Design placed first. By Mr. Vincent Hooper, A.R.I.B.A.

New Road between Eastham and Ellesmere Port, Cheshire.

(The route is indicated by the parallel lines.)

boundaries of Stanlow and Great Stanney on the southern boundary, were annexed, and were merged into one large district of Greater Ellesmere Port, the area being about one-fifth of that of Greater Liverpool.

With the exception of the approach from Chester *via* Backford Cross, the approach roads are practically all of a tortuous description. None is more so than the way from Birkenhead to Ellesmere Port, a secondary road which leaves the Birkenhead and Chester main road at Eastham. At a point about 2½ miles from Ellesmere Port a dangerous and difficult hill is encountered which presents formidable obstacles to any traffic other than powerful motor-cars. This hill is known locally as the Rivaere Hill. Heavily-laden vehicles, having once surmounted it, are within sight of the chimneys of the port, but a detour has to be made *via* the village of Whitby before the goal can be reached.

Another by-road approach from the Birkenhead road is at Little Sutton, but this road also descends precipitously through a valley, and is barely the width required for a fully-loaded vehicle.

The Urban District Council, realising the serious need of a good approach from Birkenhead, decided to adopt a scheme prepared by the Naylor Trustees to remove this obstacle to the development of Ellesmere Port and the district. This scheme provides for the development of works and factories alongside the Ship Canal. The road itself is shown on the plan. It commences at Eastham Village at a point some 6½ miles from Birkenhead, and proceeds in a south-easterly direction until it reaches a point about 200 yds. from the Ship Canal, on the lower side of the Hooton Park Racecourse.

From this point it runs parallel with the canal to Ellesmere Port, and finally passes over the railway bridge at Merseyton-road, thus giving direct access to the eastern, or dockside, district of the port.

It may be mentioned that the new road will pass within sight of Hooton Hall, which, prior to the construction of the Ship Canal, was the residence of the Naylor family. The road will also cross the Poole Hall brook, where an embankment of some 25 ft. in height will be constructed in order to provide a level road.

Poole Hall, an Elizabethan mansion, stands close by on the canal side of the road, and the grass-covered height of Mount Manesty (an artificial mound or spoil bank made of the excavations from the Ship Canal and named after the resident engineer who had charge of the works) forms a picturesque background. The road will possess much sylvan beauty, where it passes through the Shoulder-of-Mutton Plantation and the Rooston Woods, and Eastham Church will form a fine vista at the northern termination. The road will be 72 ft. in width, and will be completed in two or three years' time at a cost of about 30,000l. This amount will be borne mainly by the Naylor Trustees and partially by the Ellesmere Port Urban District Council. A large portion of the Council's expenditure will be recovered by frontage charges when the development of sites takes place.

Reserves of land will be made for accommodating railway or tramway tracks without encroaching on the width of land reserved for the road. The contract for the Naylor Trustees' portion has been placed in the hands of Mr. Charles L. Warren, of Seacombe, who has already

carried out extensive road-making contracts in the Wirral District. The plans have been prepared under the direction of the Naylor Trustees by their surveyor, Mr. Sidney A. Kelly, F.S.

A PAPAL TOWN-PLANNER

"AFTER an absence of ten years I do recognise it, so new does all appear to me to monuments, streets, aqueducts, obelisks, and other wonders—all the works of Sixtus Fifth." Thus the good Padre Don Angelo Gritti wrote at the end of the XVIIth century after a period of activity in city planning, during which the Papacy had played a great part in the remodelling of Rome. Julius II. cut the Via Giulia near the Tiber, Leo X. made the Ripetta, Pius IV. the Via Pia, and Paul III. Gregory XIII. the streets bearing their names. Sixtus V., however, far surpassed his predecessors in his zeal in reforming the city, and when it is recollected that his Papacy only lasted five years it is marvellous to behold the results and to note how Rome of to-day is indebted to him for many of her most characteristic features. The omnipresent dome of St. Peter's was finished through his energy, the Piazza del Popolo was laid out round his obelisk, the foundations for the steps in the Piazza di Spagna, the obelisks before the Churches of S. M. Maggiore and St. John Lateran, the Lateran Palace, and all due to this one man, and in order to understand his character a short sketch of his life is necessary.

One Peretto Peretti, who lived near Montalto, believed that he, though then a child, was destined to become the father of a Pope, and when on December 13, 1521, a son was born he called the child Felix.

At the age of twelve the boy entered the Franciscan Order, and, always bearing in mind his high aim—the Papacy—came to Rome where his sermons in the Church of SS. Apostoli attracted the notice of men like Loyola, Philip Neri, and the Cardinal Ghislieri, afterwards Pius V., by whom Peretti was made Cardinal. On the death of Pius V. in 1572 the Cardinal's fortunes received a severe check for the new Pope was Gregory XIII. (Bucconigatti), who was very jealous and suspicious of Peretti's income. Whereupon he retired to the Esquilina, where he passed his time building a villa in which he employed as architect a young Lombard named Fontana, who was a friend of his. This villa was called variously the Villa Peretti, Negroni, or Massimi, and was destroyed in 1874 by the municipality of Rome. Passing his time here in seclusion, the Cardinal awaited with what patience he could muster the death of the aged Pope, which occurred in 1585, and at the subsequent Conclave his behavior was as quiet and unobtrusive as his haughty and aggressive temperament would permit. The Sacred College, no doubt, had reason to regret their choice before long, for the new Pope was one of the most masterful men and resolute rulers who have ever occupied the Chair of St. Peter.

Sixtus V. was a town planner and civic ruler of the highest type. All that appertained to the city life interested him. He induced law and order among the population, he cleared out the *travi*, or hired assassins of the nobility, and even drove the *banditi* from the neighbourhood of Rome. He was perfectly just, but his measures were merciless. He turned his attention to the Papal finances, which he greatly reformed, and also established the congregations of the church in something like their present form. The reform of the Papal exchequer gave the Pope the necessary funds to carry out many improvements in the city, and the indomitable energy of the Pontiff, coupled with the mechanical skill of Fontana (now Papal architect) have given Rome many of her present landmarks.

The Pope was no respecter of antiquity; he demolished the Sestizionum, and was with difficulty persuaded to leave the tomb of Cecilia Metella untouched. He converted the disused Aqua Marcia into the Acqua Felice. He pressed on the almost despairing completion of the dome of St. Peter's, and so hurried matters that the architects Fontana and Della Porta carried the work through in twenty-two months. The Vatican Library, too, commenced in 1587, was due to the Pope's energy. Paul III. had once consulted Michelangelo for San Gallo about removing an obelisk from the circus of Nero, but both had replied that it was impracticable. Sixtus V., however, was not the man to be denied when his mind was made up, and the task was accomplished. He, however,

le his architect, Fontana, the two necessities unlimited funds and absolute power, but tactically intimated that failure would be his life.

Stories about the raising of the obelisk are by many, but Fontana, in his book on *castelli e ponti e trasporto dell'obelisco sicano* gives detailed drawings of the chimes and the manner of using them.

It suffices here to remark that the obelisk is 44 ft. long and 8 ft. 6 in. square at the base and 15 ft. 6 in. at the top, and weighs 350 tons. The disks and columns seem to have fascinated Pope, for in addition to those he mentions he placed one in front of SS. Trinita del monte, while he surmounted the columns of *roms Aurelius and Trajan* with statues of St. Peter and St. Paul, and the statues of the *re-tamers on Monte Cavallo* were placed in position by his orders.

He laid out the *Via Felice*, and the streets adjoining to the *S. M. Maggiore*, the *Via Sistina*, and the *Via S. Giovanni*, in Laterano, were constructed by him. The *Lateran Palace*, which, however, was never occupied, but was turned into a hospice about one hundred years later, was erected from designs of Fontana in 1613. He was the mover in a scheme, which is stopped at his death in 1690, to turn the *osseum* into a woollen factory with four floors, and as many staircases, and a large *mountain* in the centre. He also built the first *house*, using the word in the modern sense of a large building at the *cistherine end* of the *Monte Sisto*, to which were sent the *able-bodied* and *destitute*, those afflicted with contagious diseases going to *Porta Angelica*, and incurables *S. Giacomo* in *Augusta*.

Such, in brief, is the story of the building *temple* of the *Pontificate of Sixtus V.*, and assuredly deserves a place in the list of town *anners* of the past. Strong and resolute, he made Rome once more a well-governed and well *out* city, and in all departments of civic life the influence of his inflexible will and limited power—the two necessities of the *planner*—were felt to the lasting good of the *City of Rome*.

CIVIC DESIGN NOTES.

LAND to the extent of 750 *own-Planning* acres, having a frontage on the *Schemes in* the Great North-road, has been just purchased for an extension of the "garden *Hand.*" at *Letchworth*. The *Blackburn Town* Council have unanimously approved a town-*planning* scheme to be developed in an extensive *ea*, bounded by the *Revidge*, *Brownhill*, and *eston-road* districts. The *Local Government* Board have given authority for the preparation of town-*planning* schemes by the *Corporations* *Bournemouth*, *Halifax*, and *Southport*. The *Bournemouth* scheme is to apply to an area of about 223 acres in the *Southbourne Ward* of the borough. We referred to the *Southport* scheme in our issue of September 6 (p. 284). At *Halifax* two schemes are for the *Ovenden* and *Warley* districts, comprising about 880 acres and 756 acres respectively. A further *own-planning* scheme is in preparation by the *Urban District Council* of *Walthamstow*.

Purchase of Land for Brighton.

THE General Purposes Committee of the Brighton Corporation has decided to recommend the purchase of some 1,000 acres of the Downs adjoining the eastern boundary of the borough, including *Ovingdean Grange* and the *East Brighton Golf Links*. The price will be *35,000L.*, but, owing to the revenue produced by the land, it is estimated that the annual charge on the rates will be only *450L.*, after allowing for *demption* of loan and interest. It is intended to occupy part of the site by a *convalescent home* for the poor, which will be built and endowed out of a sum of *40,000L.* given to the town by *Mr. John Howard*. It has been suggested that the *village of Rottingdean* may ultimately be included in the *Borough of Brighton*.

The Borough Council on September 23 resolved by thirty-*road, Croydon*. five votes to sixteen to adopt the scheme for a relief road for motor traffic passing to the west, from

Thornton Heath to the Brighton road at *Turley*, by way of *Thornton-road*. *Waddon Marsh-lane*, *Waddon Court-road*, *Coldharbour-lane*, *Russell Hill-road*, and *Furley-corner*. The road will be 60 ft. wide, and follows existing thoroughfares, with the exception of about 180 yds. near *Waddon Court-road*. Towards the estimated cost, *55,493L.*, the Road Board promise to give *30,000L.* and the Ecclesiastical Commissioners *5,500L.* The Borough Council decided also to apply to the Local Government Board for sanction to borrow *19,743L.* When that is obtained they will at once proceed with the work.

The Real Purpose of the Town Planning Act.

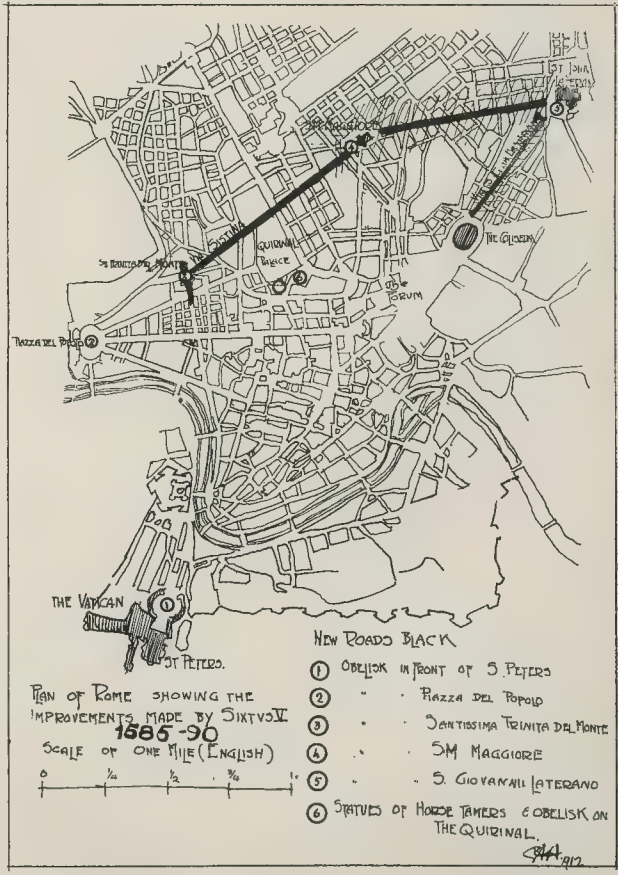

THE Housing and Town Planning Act, 1909, is being taken advantage of upon an absurdly inadequate scale, and not for the most essential ends. The regulations made by the Local Government Board do not encourage local bodies to do town planning; their effect is rather deterrent. At the present rate it will be over two centuries before the towns of England are properly town-planned. The little work that is being done under the Act has largely been in the direction of facilitating garden suburbs. This is well, but the truth is that garden suburbs can, as they did before the Act was passed, look pretty well after themselves; and the purpose for which the intervention of the law and the public authorities is indispensable is not to make the laying out of a few areas ideal, but to make that of the mass of our urban areas reach a tolerable standard of beauty, amenity, and convenience—*Daily Chronicle*.

Arterial Road in Lancashire.

A PROPOSAL, in which the Lancashire and Cheshire centres of the Roads Improvement Association are interested, has been put forward for the creation of a new arterial road connecting Liverpool with Southport, and from thence proceeding to Preston. Besides reducing the distance between these towns, such a road would serve the needs of the smaller seaside towns, which, since the advent of the railway, have outgrown their road facilities. It would also open up an agricultural district and land suitable for building development, and would probably prove to be a better method of improving the road communication between Liverpool and Preston than by the widening, straightening, and regrading of the existing roads. Should the Roads Improvement Association definitely approve the scheme steps will be taken to enlist the sympathy and co-operation of the Road Board and of the various local authorities concerned.

Insanitary Areas at Glasgow.

THE Glasgow Corporation proposes to deal with five insanitary areas more or less similar in character, but varying from 2½ to 9½ acres in extent, and containing a population of about 410 to the acre, as against sixty over the whole city. The average death rate in the city from all causes is 16.9 per 1,000; in the combined areas it is 22.7. The infantile mortality in the city is 136 per 1,000 births as against 180 per 1,000 in the combined areas, while in one of them it rises to 282 per 1,000. It is proposed to acquire and demolish the property. If, however, negotiations fail the Council will prepare an improvement scheme.

Plan of Rome showing improvements carried out by Pope Sixtus V.

THE BUILDING TRADE.

BUILDING NOTES FROM AUSTRALIA:

THE STATE AS LANDLORD.

THE expansion of the city of Sydney has during the last few years resulted in the remodelling of large areas. New streets have been formed, tenements demolished, and factories and business premises erected in their stead. The work is still going on, and is likely to continue for many years to come. This work has made the building trade extremely brisk. All workmen are employed, and all available building material is quickly absorbed. But, in spite of an average annual outlay of four or five millions upon the erection of buildings, there is a great scarcity of houses. Private enterprise failing to erect houses quickly enough to meet the demand, the New South Wales Government determined a short time ago to take up the work. A commencement was made on an area of land in one of the suburbs. A Bill was passed through Parliament authorising the Government to undertake the construction of 800 houses of from four to six rooms. Over three months has elapsed since the first brick was laid, and there are now two houses available. The Government advertised for tenants for these. Six hundred and eighty applications were received. Of these eighty-five offered to pay 7s. 6d. to 10s. 6d. per week, 199 from 11s. to 12s. 6d., 261 from 13s. to 16s. Tenants will be selected by ballot.

The object of the Government in entering upon this building scheme was mainly to strike a blow at private landlords, who were said to be taking advantage of the scarcity of houses by charging exorbitant rents. It was thought that the Government, having unlimited resources, and not entering the field for the sake of profit, could soon erect a sufficient number of houses to overtake the demand. But it has proved otherwise. In spite of the fact that the Government has its own brick and lime kilns, cement works, and timber yards, it is hopelessly unable to keep up a sufficient supply of materials. It has also difficulty with its employees, who are employed on the day labour system, and the poor result of its socialistic enterprise has disappointed those who at the outset were its warmest supporters. It has, in fact, intensified the difficulty. Capitalists have withheld from embarking upon building enterprises, preferring not to enter the field in competition with the Government.

Building Regulations at Melbourne.

New building regulations for the city of Melbourne have been drawn up in order to replace those introduced about 1865, and which have been in force ever since.

The most important section of the regulations relates to the new materials and their methods of use. With the introduction of the steel frame works, and also the concrete foundations, the thickness of the walls has been greatly reduced. In the case of the brick walls the minimum thickness is now 9 in., a very great reduction on the old regulations, which gave an absurd margin of safety. The calculations are now based on length as well as height, whereas formerly it was merely a question of height alone which determined the strength of walls. The clauses dealing with the quantity of mortar and sand are stringent, and the proportions for the mixing of concrete are definitely stated. The safe bearing load to apply to concrete when Portland cement is used is to be taken at 12 tons per square foot. The Council is to be given power to approve, with the consent of the referees, any new materials or methods of construction different from those set out in the regulations.

In the old regulations it was stated that no building should be erected upon foundations that were not set on bed rock, but now provision has been made for artificial foundations. This means that rafts or piles may be used where necessary, on which superstructures may be placed. Foundations of all walls of wood are to consist of red gum or jarrah strumps 4 in. square, spaced not less than 18 in. below the natural surface of the ground.

Buildings are to be allowed to be erected to a height of 132 ft., instead of 110 ft., in streets that are 99 ft. wide, but this subject to certain conditions being fulfilled. In streets 33 ft. wide the height has been increased from 82 ft. 6 in. to 99 ft. The minimum of each story from floor to roof is to be 9 ft. The greatest space to be enclosed by dividing walls and fireproof ceilings is 360,000 cub. ft. This means that for about every four stories there shall be a fireproof floor. Special fireproof materials are laid down.

Under the old regulations the special provisions laid down for either lighting or ventilation were totally inadequate, and many of the old buildings are to-day being reconstructed to allow light courts to be placed in the centre of the buildings. In many instances the property owners, to save space, curtailed the lighting courts, and with the advent of the more modern and naturally lighted building, the offices lighted with artificial light could not be let. The new regulations lay down minimum space for the light courts and specific directions for ventilation. Every room is to be provided with outlet ventilators, of which the total area in square inches, free from obstructions, shall be equal to the cubic capacity of the room in cubic feet divided by 75. Every room of a domestic building is to have one or more windows opening directly into the external air, or into a conservatory with a total superficies equal to one-tenth of the total area of the room. Provision is also made that the window shall be easy to open. The height of any wall abutting on a light court is not to exceed three and a half times the width of such court, if it be enclosed, or may be enclosed on every side, or four times the width if it be open at one or both ends.

At the present time the only buildings that must be provided with fire-escapes are factories and warehouses, but the new regulations insist that fire-escapes and protection, as complete as possible, shall be provided in all office and domestic buildings as well.

THE INSURANCE ACT AND WORKMEN'S COMPENSATION.

AMONGST the subjects discussed at the meeting of the Law Society was the question of Insurance and Workmen's Compensation. As no benefits are yet payable under the Insurance Act, the joint operation of the Act and Workmen's Compensation has not yet come in for much consideration, but in the future, we imagine, a good deal will be heard about this question. Sect. 11 of the Insurance Act deals with this point, and the provisions of that section are somewhat curious.

Subsect. 1 (a) provides that no sickness or disablement benefit shall be paid to any person who has received or recovered or is entitled to receive or recover (the italics are ours) compensation under the Workmen's Compensation Act or damages under the Employers' Liability Act where the weekly sum or the weekly value of any lump sum is greater than the benefit, and if it be less the benefit shall only be paid to make up the difference to what would be the full benefit.

Subsect. 2 provides that "Where an insured person appears to be entitled to any such compensation or damages as aforesaid, and unreasonably refuses or neglects to take proceedings to enforce his claim, it shall be lawful for the Society or Committee concerned either (a) at its own expense to take in the name and on behalf of such person such proceedings, in which case any compensation or damages recovered shall be held by the Society or Committee as trustee for the insured person, or (b) to withhold payment of any benefit to which, apart from this section, such person would be entitled." If the Society or Committee take proceedings and fail, they shall be liable for costs. Now, of all branches of the law in which uncertainty exists, the Workmen's Compensation Act has proved the most difficult to construe. The Court of Appeal and the House of Lords are constantly divided in opinion as to whether compensation is or is not payable, and the number of appeals has been enormous. Are the Societies to undertake speculative actions?

And are their funds to be liable for costs under the House of Lords? Worse still, is the insured person to be deprived of every benefit to be compelled to take the plunge into the vortex of litigation, and in his case where the costs to come from? Lastly, will not insurance companies withhold payments on the chance of making the insurance funds liable and will not litigation be increased?

Besides the questions under subsect. 1 (a), Societies and Committees have to determine that difficult question—the weekly value of a lump sum, and an appeal lies from the decision, in the case of a Committee to Insurance Commissioners, in the case of a Society according to its rules, but with ultimate appeal to the Commissioners (sect. 67).

Practical considerations appear in many ways to have been laid aside in this hurriedly conceived piece of legislation, and we are present only at the beginning of troubles in connexion with its administration. The past of the Act and its subsequent administration irresistibly recalls to mind a line from a nursery rhyme, which is applicable in many ways: "Send for a doctor, quick. Anyone will do."

LAND REGISTRATION.

At the meeting of the Law Society some adverse comments were made upon the Memorandum recently issued by the Land Registry, to which we alluded in our issue of June 14 last, and a paper was read upon "The Land Transfer Problem," by Mr. J. S. Rubenstein, in which he advocated registration deeds in place of registration of title; but the question was rather shelved, as an amendment to a resolution moved by him, suggesting a conference of persons interested in land with a view to taking concerted action, was carried simply leaving the question to the consideration of the Council.

Without again entering into the merits of the system of compulsory registration, we will suggest that a long enough time has elapsed since registration was made compulsory as an experiment in the County of London for some definite conclusions to have been arrived at, and that this very partial compulsion limited to one area, and only applied in its least useful form to "possessory titles," prejudices property in that area, and therefore some steps should be taken either to extend or, far better, to terminate an experiment which has been tried now for some twelve years.

It will be remembered that even in the Memorandum issued by the Land Registry was stated that the object of the Acts was to attain registration with absolute title, but that "it would obviously be impracticable to complete registration of an absolute title in all cases. The registration of possessory title, it was explained, was a sort of compromise, and, as possessory titles take a considerable time to mature, the benefit of the system was not appreciated. Such a makeshift experiment must operate to the disadvantage of the one area in which it is made compulsory, and where everyone is turning to the overburdened land with a view to increasing taxation we submit that their energies might first be better directed to devising a cheap and efficient form of transfer."

A MODERN INQUIRY.

THE *Times* on September 23 published a form with a schedule of inquiries marked "Private and Confidential," which, it is alleged, is for use by the Committee who are to inquire into the occupation and ownership of land. It is also assumed that the Chancellor of the Exchequer is associated with this inquiry. It is surely essential that the constitution and authority of this Committee should be made clear, for if it is a private investigation it is a piece of impertinence, whereas if in reality it is countenanced in official quarters its private and confidential character not only forms an entirely new departure, but is a development of Star Chamber practices. Besides an army of valuers and two or three regiments of

City of London.—The erection of a forecourt boundary at less than the prescribed distance from the centre of Bell-yard, Gracechurch-street, City (Mr. W. Campbell Jones for the Hong-Kong and Shanghai Banking Corporation).—Consent.

Pinsbury, Central.—Erection of a building to abut upon High-street, White Lion-street, Seabrook-place, and Angel-mews, Islington (Mr. H. Harrington for Mr. Davis).—Consent.

Hammersmith.—Erection of a building on the eastern side of British-grove, Hammer-smith (Chibbald's Bakeries, Ltd.).—Consent.

Hammersmith.—Erection of a building at the rear of Nos. 106 and 108, King-street, Hammersmith (Messrs. J. S. Quilter & Son for Mr. J. C. Platt).—Consent.

Kensington, North.—Erection of an addition at Nos. 15A, 14A, 15A, and 16A, Colville-mews, Notting Hill (Messrs. Thackray & Syms).—Consent.

Levensham.—Erection of an addition to Pentland House, Old-road, Lea, with a forecourt boundary (Mr. R. S. Ayling for the Worshipful Company of Goldsmiths).—Consent.

Paddington, North.—Erection of an addition at No. 12, Shirland-mews, Paddington (Messrs. Cuthbert Lake & Co.).—Consent.

St. George, Hanover-square.—Erection of an addition at the St. James's Club, Piccadilly, at less than the prescribed distance from the centre of the roadway of Brick-street (Messrs. Maple & Co., Ltd.).—Consent.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ADLINGTON.—Addition to works for the Pincoft Dyeing and Finishing Company.

BARBUGH.—Electricity generating-station (25,000kV) for the Yorkshire Electric Power Company.

BEDWORTH.—Church, Coventry-road, for the Trustees of the Croxhall-street Baptist Church. Birmingham.—Warehouse, Warstone-parade. Messrs. Riley & Smith, architects, 135, Colmore-row, Birmingham. Factory, Charlotte-street; Mr. F. Suffield, architect, 57, Colmore-row, Birmingham. Theatre, Station-street; Mr. S. N. Cooke, architect, King's Court-chambers, Birmingham. J. Bowen & Sons, builders, Balsall Heath, Birmingham. Extensions to Council House and Art Gallery (57,068sq. ft.); Messrs. Barnsley & Sons, builders, 102, Ryland-street, Birmingham. Bognor. Town-planning scheme; Mr. O. A. Bridges, Surveyor. Town Hall, Bognor.

BRIGHTON.—Headquarters (2,500kV) near Grand Parade for the Brighton Imperial Service (Cable Corps; Mr. J. W. Hawkes, architect, North-street Quadrant, Brighton).

BURY.—Additions to saw mills for Messrs. J. Atherton & Co., hardwood merchants.

BURY ST. EDMUNDS.—Additions at infirmary (3,270kV); Messrs. Grimwood & Son, builders, Sudbury, Suffolk.

CAISTON.—Unionist hall; Mr. A. S. Hewitt, architect, Regent-street, Great Yarmouth.

CARSHALTON.—Auction hall and offices, North-street, for Messrs. G. E. Hough & Co., auctioneers and surveyors, North-street, Carshalton.

CHICHESTER.—Proposed bacon factory; Mr. F. H. Chadwick, J.P., Chairman, West Sussex Farmers' Union.

CHORLEY.—Schools (4,000kV) for the Trustees of St. Joseph's Roman Catholic Church, Harpenden, Chorley.

CLEATOR MOOR.—Branch premises, etc., at Kells for the Co-operative Society.

COATBRIDGE.—Additions and alterations to ranger's house, Dunbeth Park (360kV); Surveyor, Burgh Hall, Coatbridge.

DALKEY.—Forty-four houses, Carraway-road, for the Dublin United Tramways Company.

DARWEN.—Alterations at St. George's Church (1,000kV) for the Vicar.

DAVENTRY.—Enlarging isolation hospital (1,000kV); Mr. J. B. Williams, Surveyor, Town Hall, Daventry.

* See also our list of Competitions, Contracts, etc., on another page.

DOUGLAS (Isle of Man).—Opera house for the Directors of Derby Castle, Douglas.

DUBLIN.—Stables for the Corporation (574kV); Messrs. B. Pemberton & Son, builders, Wellington Lodge, Serpentine-avenue, Ball's Bridge, Dublin.

DUDLEY.—Conveniences, Market-place (967kV) and Holly Hall (443kV); Messrs. Jakeman & Round, builders, Vicar-street, Dudley. Plans have been passed for extensions to electric theatre, High-street, for the Wolverhampton and Dudley Breweries, Ltd., and for extensions to offices, Washington-street, Netherton, for Messrs. N. Hingley & Sons.

DUKINFIELD.—School; Vicar of St. Luke's Church, Dukinfield.

DUNDEE.—Additions and alterations to the Royal Infirmary (1,780kV) for the Governors.

ECCLES.—The following plans have been passed:—Ten houses, Harrison-street, Peel Green, for Mr. James E. Owen; works and store, Irwell-terrace, for Messrs. Barnak, Ltd.; extensions to warehouse, Silk street, for the Eccles Industrial Manufacturing Society, Ltd.; additions to Salvation Army Hall, St. James's street, for Mr. W. B. Booth.

ELTON.—Extensions at dyeworks for Messrs. S. Smethurst & Sons, Ltd., cotton dyers; extensions at foundry, Wood-street, for Messrs. Charles Walmesley & Co., Ltd., wholesale iron-founders.

ERITH.—Hall, etc., Avenue-road, for the Trustees, Wesleyan church.

GARSTANG.—Council offices, Lancaster-lane; Messrs. Collinson & Sons, builders, Nately, Garstang.

GREENOCK.—Five houses, Serpentine-walk, near Crescent-street; Mr. A. J. Turnbull, Master of Works, Burgh Hall, Greenock.

GRESFORD.—Conservative club; Messrs. Swainson & Sons, architects, 42, Regent-street, Wrexham.

HALMEREND.—School; Mr. J. Hutchings, Education Officer, Stafford.

HAREFIELD.—Rebuilding Swan public-house for Messrs. T. Wethered & Sons, Ltd., brewers, Marlowe.

HAYES (Middlesex).—Factory, Silverdale-road, for the Orchestral Company, pianoforte manufacturers, Hayes.

HEATON.—Electric theatre; Mr. Percy L. Browne, architect, Pearl-buildings, Northumberland-street, Newcastle-on-Tyne.

HEBDEN BRIDGE.—Church (8,000kV) for the Trustees, St. John's Mission Church, Hebdon Bridge.

HERNE BAY.—Extensions to pavilion; Mr. F. W. J. Palmer, Surveyor, Urban District Council Offices, Herne Bay.

LISCARD.—Addition to the Lancashire and National Sea Training Homes for Poor Boys for the Navy League, 11, Victoria-street, S.W.

LLANWRIN.—School; Mr. L. Phillips, Montgomeryshire Education Officer, Newtown.

LUTON.—Baths (12,595kV); Mr. T. Higgs, builder, Moore-street, Northampton.

LUTTERWORTH.—Seven houses, buildings, etc., Misterton Estate; Mr. S. Pick, County Architect, Millstone-lane, Leicester.

LYME REGIS.—Thirty-two houses (1,595kV); Messrs. W. Caddy & Sons, builders, Lwesden, Lyme Regis.

MEDOMLEY.—Church; Mr. J. Eltringham, architect, Railway-terrace, Blackhill.

MENSTONE.—Hospital (5,500kV); Mr. E. C. Newstead, Clerk, Wharfedale Guardians' Offices, Otley.

NELSON.—Weaving shed (2,000 looms) for Messrs. Nelson & Sons, manufacturers, Nelson.

WEAVING SHED (1,500 looms); Mr. J. E. Atkinson, builders, Shaw-street, Colne.

NEWTON.—School (6,500kV); Mr. A. H. Collingwood, Education Officer, Carlisle; architect to be appointed by competition.

NEWTOWNS.—Factory, South-street, for the Irish Tapestry Company.

NORMANTON.—Picture theatre, St. Thomas's-road; Messrs. Ford & Sons, builders, Summerhill, Victoria-street, Derby.

NORTON.—Picture hall, Welham-road, for the Universal Bioscope Company.

NORWICH.—Headquarters of children's homes (2,365kV); Mr. S. E. Hodge, builder, 69, Gort-rude-road, Norwich.

PETERSFIELD.—Additions, etc., to the Petersfield and District Steam Laundry for the proprietors.

PLYMOUTH.—Workshops at Compton Tramway Depot (800kV); Mr. C. R. Everson, Tramways Manager, Town Hall, Plymouth.

PRESTWICK.—One hundred and fifty houses; Manager, Prestwick Colliery Company.

RAWENSTAN.—Alterations to central station; Mr. J. Johnson, Surveyor, Town Hall, Rawtenstall.

REDFORD.—Isolation hospital; Mr. J. D. Kennedy, Surveyor, Market-square, Redford.

RHVL.—Drill hall, etc. (4,000kV); H.M. War Office, Whitehall, S.W.

RICARTON JUNCTION.—School for the Castle-ton School Board.

ROCHESTER.—Additions to King's School, The Precinct, for the Governors.

RUGBY.—Motor garage at works of British Thomson-Houston Company, manufacturing electrical engineers; alterations to premises, High-street, for Messrs. Ltd., chemists.

SALFORD.—Plans have been passed for Withington-street, Pendleton, and Farnley-road and Strawberry-road, Pendleton, lodged for works, Meadow-road, Broughton and electric theatres, Great Clowes, Broughton-lane, Broughton, and Devon-street, Broughton.

SALTCOATS.—Plans have been lodged for theatre in Hamilton-street by Mr. George Kemp.

SOUTHAMPTON.—Extensions to underground convenience, Pound Tree-road (260kV); J. A. Crowther, Engineer, Town Hall, Southampton. A plan has been passed for lodging No. 17, High-street for Messrs. W. Burnett. Plans have been lodged for houses, etc., Leighton-road, by Mr. C. Soper.

SUNDERLAND.—Institute, Moorgate (850kV); Messrs. Caws, Steel, & Caws, Agents, 22, Fawcett-street, Sunderland. Thornton.—School, Heys-street (2,872kV); H. Litter, architect, 16, Ribblesdale, Preston.

UPWAY (Dorset).—Pumping station, (8,162kV); Messrs. Jesty & Baker, builders, Castletown, Portland.

WALKER.—Proposed garden suburb houses; Mr. Frederick J. Holford, Architect, Town Hall, Newcastle-on-Tyne.

WAVERTREE.—School, Thingwall-road (places); Mr. J. Legge, Education Officer, Liverpool.

WESHAM.—Additions to premises for Wesham Mill Company, Ltd., cotton spinners.

WILLESBOROUGH.—Additions to works of Albemarle-road, for Messrs. Earl & Balfour.

WOLVERHAMPTON.—Nursing infirmary, T. & S. Ham, builders, Manders-road, Wolverhampton.

YSTRADFELLE.—Memorial hall; Mr. G. Hann, architect, 39, Castle-street, Swansea. Mr. T. Davies, builder, Aberdare.

FOREIGN AND COLONIAL

Building in Bavaria.

Mr. Ehrenbacher, British Consul, reports on the building trade of Bavaria for states that private building, as well as for Government and municipal purposes, was very brisk, and in consequence of the generally good, it has so far found impracticable to syndicate building tractors, in consequence of the difficulty of reconciling conflicting interests and aims; this is further intensified by the dissimilarity of the trade. The sales of near building materials, the Consul continues, exceptionally large in the spring of the year under review. During the height of the extended terms had to be granted for deliveries. The continual heat which set in on checked trade, but in November, December business became again more favourable to the open weather, which was good profits were only realised by manufacturers of such articles as cement, cement iron girders, reed mats, etc. For these at minimum sale prices were fixed by associations or syndicates, and thus the cutting down prices had, to a large measure, been avoided. On the other hand, prices had been low articles for which manufacturers were syndicated, especially for tiles, gypsum, plaster of Paris sheets, etc.

Roads in the Dominican Republic.

Laws have recently been passed with object of carrying out city improvements road-making generally in the Dominican Republic. The scheme includes the construction of roads designed to connect the main provincial cities with commercial harbours, also the erection of houses in the towns and extensions are needed.

Public Works in Austria-Hungary.

The municipal authorities of Reichen (Austria) have decided to apply to the Government for powers to contract a loan for purpose of carrying out public works. The estimated cost of the scheme is estimated at a sum of 732,000kV, which will be required for the carrying out of drainage, street paving, waterworks, etc., abattoir improvements, the construction of barracks, and other purposes.

Building Material and Accessories.

The municipal authorities of Nagyvér (Hungary) will invite tenders shortly for erection of workmen's dwellings at a cost about 34,600kV.

Cardiff Fire-station Competition : First Premiated Design.
By Messrs. E. Vincent Harris & T. A. Moodie, A.A.R.I.B.A.

CARDIFF FIRE-STATION COMPETITION.

is somewhat uncommon problem presented the planning of a fire-station probably on this competition elicited, and also for the fire standard reached by the premiated designs. At the time of reviewing only the four placed by the assessor, Mr. A. Marshall McKenzie, A.R.S.A., were available for examination, so it was impossible to judge of the competition as a whole. A first casual glance at the several schemes seems to suggest inconsistency in the award, which may perhaps have been attributable in a problem which admitted of more than one solution. Of this and other points it will be possible for competitors to judge later, when the whole of the drawings are to be exhibited at the City Hall, Cardiff, this and part of next week.

We have briefly noted the result in our last issue. The site is on an angle formed by the junction of a narrow street with a broad thoroughfare (Eastgate-street), with the greater frontage to the latter. The cost limit, 15,000*l.*, seems, from reports attached to the designs, to have been ample to allow of satisfactory treatment. The design placed first, that by Messrs. Vincent Harris & Moodie, of London, illustrated here, consists of a rectangular main building fronting along the principal frontage, with a smaller block placed at the rear and along the rear frontage to the narrower street. This resulted in a compact-looking scheme, in which all the firemen's quarters are provided in the engine-room and contingent departments, but it is effected at the cost of taking the building an additional story to those required in the conditions. The superintendent's office is in an isolated position—a feature unique amongst the premiated designs. The fire vans and ambulance housing arrangements might be criticised on the score of convenience, and, as far as the present horse-drawn arrangements are concerned, a certain amount of re-arranging would be necessary within the engine-room to get them into their places after being swung down, as the duty stalls block ingress into the yard. A good feature is the additional cases at the south end of the building from the engine-room quarters. The quarters are quite compactly arranged, and the sliding pole arrangements are very suitably placed. There is a convenient fire engine store extending practically under the main building, but which is, however, badly lit.

The elevations are treated on broad and suitable lines. A curious note in the report is to the effect that the "buildings are isolated from surrounding properties in case of fire"! This scheme is priced at 14,690*l.*

The second premiated design, by Messrs. Jones & Thomas, of Cardiff, shows an immense engine-room, 85 ft. by 35 ft., rather more than half as large again as asked for. The hose tower is placed entirely within this room, which does not strike us as a convenient arrangement. The watch-room is entirely dependent upon borrowed lights, and to reach the superintendent's office from the engine-room one has to traverse a corridor and cross the main entrance passage to the firemen's quarters. The position of the escape house in this design seems very questionable, as the apparatus would have to be run out into a very narrow thoroughfare and swung immediately it was through the doors. On the upper floors the tenements are cramped,

and the living-rooms overshadowed by balconies—a fault easily remedied by placing them in the front of the building, as was the case with most of the other designs.

The elevations are "neo-Greek" in character, and would have made an interesting façade. The drawings comprising this design are beautifully executed, and may have influenced the assessor to some extent in his decision to give the scheme second place.

Messrs. Mangnall & Littlewoods, of Manchester, receive third position with a scheme which cannot be considered one of outstanding merit. An undue proportion of the ground floor of the main building is given up to the superintendent's living accommodation, and to the prison van and ambulance store, with the consequence that other required rooms and offices, stores, etc., are disposed about the yard, reducing its area, which was noted as being an important feature on account of its intended use for drill purposes.

Cardiff Fire-station Competition : First Premiated Design.
By Messrs. E. Vincent Harris & T. A. Moodie, A.A.R.I.B.A.

"Dura Den," Beckenham Place Park.

Mr. A. C. Morris Edwards, A.R.I.B.A., Architect.

The tenement arrangements on the upper floor are in places quite a jumble, with long dark passages; in one case a larder is entirely enclosed and without light, and in another light and ventilation is got from solely the main staircase hall.

These elevations are far too pretensions and quite unsuited to a fire-station. The central tower, which appears to dominate the Westgate-street front, in reality stands alone in the yard, far back from the building, and could never have anything like the effect it has in illustration.

The fourth premiated design is by Messrs. Wilmott & Smith, of Cardiff, and is somewhat unique. At the same time it is difficult to understand why it received serious consideration at the hands of the assessor. The lay-out takes the form of a triangle consisting of three blocks of building, enclosing a washing space for engines, and with a flat roof forming the drying yard for clothes, etc., over. This means that the enclosed yard and one side of each block facing it would be absolutely dark. It seems quite an error of judgment to cut off the drill-yard from the main building by an intervening block. The tenements are all arranged in the Westgate-street front portion, and form a symmetrical block.

One was forced to the conclusion that, with the exception of the design placed first, none of the premiated ones would have proved a satisfactory solution of the problem in execution.

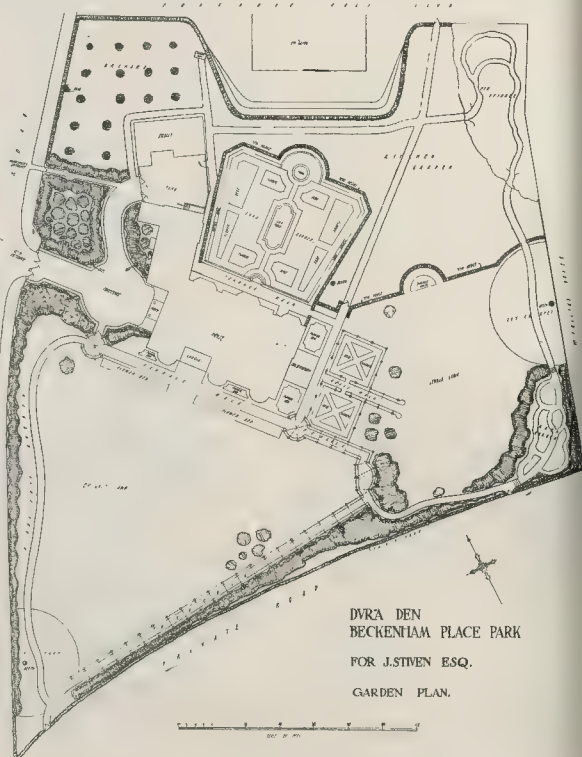

"DURA DEN," BECKENHAM PLACE PARK.

THE planning of this house was largely influenced by its position being on the boundary of the Foxgrove Golf Links, with an extensive view across them. It is built of 2-in. red bricks in varied tints, with half-timbering of solid English oak on the first floor left to weather of its own accord. Sand-faced Loughborough tiles of a dark strawberry colour have been used for roofing purposes.

The best outlook facing north-east causes the reception-rooms to be separated on plan, and this determines the large central panelled corridor which leads from the hall to the conservatory, and from which the reception-rooms are approached. These are also panelled, oak being employed for this purpose in the case of the dining-room and billiard-room. The house is entirely built on two floors with the exception of the smoking den, which has been placed in a tower at the south-east corner of the building, and commands extensive views of the surrounding country.

The laying-out of the garden has been considered in due relation to the house and links. The main entrance is approached through a circular forecourt with a road to the garage

on the left and an entrance to the garden the right. On the north-east front there is a sunk garden with lily ponds between the house and the links. The rest of the garden

is given up to tennis and croquet lawns, patios, and walks, etc.

The contractors were Messrs. W. F. Blay, Ltd.; Messrs. C. H. Norris supplied the 2-in. bricks; Messrs. G. Tucker & Son the roof tiles; Messrs. Drew, Bear, Perks, & Co. the steelwork; Messrs. Wontner Smith, Gray, & Co. the heating and domestic hot-water supply; Messrs. Wing & Webb the door and window furniture; Messrs. Marten van Straaten the floor and wall tiling; Messrs. Strode & Co. the electric installation; Messrs. Doultons the sanitary fittings; the Bromsgrove Guild the modelled plasterwork and electrical fittings to reception-rooms; Messrs. Salway Bros. the entrance gates; and Messrs. Cheal & Son the garden.

CHALET AND RESIDENCE, RIDDLEDOWN COMMON.

This building was designed by Mr. Sydney Perks, F.R.I.B.A., to accommodate school-children for teas, etc., and the house adjoining is planned for one of the keepers of the Common.

BUSINESS PREMISES, CONDUIT-STREET.

THESE showrooms (p. 394), for Messrs. Rolls-Royce, Ltd., are situated in Conduit-street, W., and have just been redecorated from the designs of Mr. E. Keynes Purchase, F.R.I.B.A., in the style of Charles II.

The plan of the main showroom may be said to be divided into four distinct bays, separated from each other by oak pilasters, having finely-carved caps and bases of the Ionic order. The walls are treated entirely in English oak panelling, with large bolection mouldings and folded panels. All the oak was treated with a dark stain, which was applied while hot and worked in with the aid of wire brushes, the latter also tearing the grain of the oak and giving it a more or less antique appearance. The heavy oak cornice, with the gilded ornament applied to same, taken from an original example of the period, give a characteristic finish to the panelling and leads up to the ceilings, which are finely enriched with typical ornament. One of the features seen immediately upon entering the showroom is a finely-carved and gilded side-table, with marble top and mirror frame above, the upper panel of the frame being filled with old red silk having an old "cartel" clock of the period fixed in it. This feature adds interest at this

Mr. E. Keynes Purchase, F.R.I.B.A., Architect.

The council has been recommended to approve the widening of Ashcombe-road Bridge at an estimated cost of 3,000*l*. Slab-paving is to be substituted for brick-paving in the footpaths of the road for a distance of 100 yds. at a cost of exceeding 105*l*. A sun-road at 300*l*. is provided for in the next half-year's estimates for tar-paving works in Coombe-lane. The Borough Surveyor has been directed to prepare a plan showing the extent of the cost of making up the Ashcombe-road. The same savings have been received from the Local Government Grant—793*l*. for "Roadmaking" paying in High-street 1,210*l*. for woodblock paving in Torprie-road, Hill-road, Broadway, and Mersey-road—800*l*. for foundations in connection with above.

The permanent rise in the price of coal emphasises the importance of getting the full heating value from fuel used in warming homes, offices, shops, and factories, and only with a scientifically designed Central Heating System can this result be obtained—all the heat in the fuel utilised advantageously in other words, at least four rooms *thoroughly* warmed with the fuel used to heat inadequately only one room with open fires.

IDEAL & IDEAL
RADIATORS & BOILERS
For warming houses, flats, hotels,
shops, public buildings, etc.,
by hot water or steam

For Central Heating by Low Pressure Hot Water or Steam, "Ideal" Boilers are most efficient—they are the product of lengthy and wide experience combined with scientific and technical knowledge and practical tests carried out under exacting conditions.

If you have not our Catalogue, a copy will be gladly sent on request — besides full particulars of "Ideal" Radiators and "Ideal" Boilers, it contains much valuable information on scientific heating.

We supply all heating accessories — Valves, Tools, Fittings, Registers, Ventilators, etc.

OFFICIAL ARCHITECTS.

WITH the increasing complexity of modern life and the multiplication of public bodies and authorities all requiring buildings for various purposes, the question of the best way in which they can utilise the services of the architectural profession naturally comes to the front. There are many signs that the whole question, affecting as it does the interests of members of a great profession, must be carefully thought out in the near future, and that the Royal Institute of British Architects and its allied societies must, in the interests of both architecture and architects, adopt some definite and well-defined policy.

It is necessary for this policy to be based on one consideration only if it is to carry weight with the public, and that must be the means by which the public are best protected and obtain the services of the best men in the profession on reasonable terms. Architects as a body cannot expect to be avowed at the ratepayers' expense, and must make out a case defensible and reasonable on public grounds.

The present position is this: We have town and county councils who are responsible for public buildings

within their areas; boards of guardians, Government departments like the Board of Trade, Office of Works, the Post Office, the War Office and Admiralty, the Home Office, and a number of smaller bodies all having important buildings to erect which are almost entirely carried out by salaried officials.

Most Governments have their own architectural advisers, though in America representations made by the profession have resulted in a large number of commissions for important buildings being placed in the hands of outside architects—a precedent which deserves careful consideration here, where we are disposed to believe the obstacles to a change in the existing régime are so great as to render it impossible.

Most county authorities have now their official architects, and since the abolition of the school boards and the relegation of their work to committees of town and county councils these architects usually carry out the schools in their respective areas. The towns and cities for the most part do not employ their own architects, though the London County Council, the Corporations of Manchester, Glasgow, Sheffield, Bradford, and a large number of other towns which might be cited form important exceptions

to the rule, and the practice appears to be steadily on the increase. Boards of guardians usually employ outside architects, but their functions may at any time be handed over to other authorities or be exercised by some new department to be created with a corresponding alteration to that which took place when school boards were dissolved and the architects employed by them were replaced by the newly-appointed official architects of the town and county authorities.

On all sides there is abundant evidence that the field of the outside architect is being restricted and that of the official architect correspondingly enlarged. This, though serious from the point of view of the outside architect, cannot be expected to be a point about which the average man will trouble himself unless it can be clearly shown that his interests are affected thereby.

The arguments of a public body in support of appointing an official architect are as follows:—Firstly, it is said that the cost of his salary, plus that of his staff, represents a smaller average sum to the community than the fees of an outside architect doing the same work. Secondly, it is claimed that the fact that he is continuously employed on

similar problems gives him a greater power in mastering them successfully; and, thirdly, it is considered to be an advantage to be able to demand his whole time and to always have him more or less under "control." The latter consideration is not perhaps openly stated, but we believe it appeals to the average member of a public body very strongly.

As to the question of economy, it must be borne in mind that economy in fees may be no economy at all if (as is sometimes the case) it carries with it economy in brain power. To see any set of competition drawings would convince almost anyone of this fact; to see a number of sets of competition drawings would convince most men that there is no certainty, because we find a certain man has thought out the best solution of one problem, that he will be equally successful with another. All we can predicate is that he is likely to produce work of a certain degree of merit and taste, that he will, or will not, be vulgar or commonplace. A further point is that many men's power of work varies at different periods of their lives, and that if a man receives an appointment it is in most cases one which he holds for life, in the period of which his powers may either wax or wane. In this way the public body is taking a risk and committing itself to what in the nature of things can but be an experiment. Again, we may say that it frequently happens that the best men in a profession are conscious of ability, and, this being so, will not, as a rule, consent to take positions which tie them down. For these reasons we feel that the public body will often fail in obtaining the best of all economies—the service of the most able men in the profession.

The second form of economy—the question of the relative remuneration for services under the two methods—is somewhat more difficult to deal with. It is said that one can prove anything by figures, and it is largely true. Naturally, the official when appointed wishes to justify the system, and there are many ways in which this can be done. Certain buildings may be designed several times, and it is easy to make out that certain fees would, as a rule, be paid to the outside architect for each separate operation. As a matter of fact, the knowledge that an architect has to be paid fees renders the employer explicit in his instructions, and most architects know that it is unwise to charge fully for every item of their services, and do not do so. Then, too, there are items for rent of offices, materials, and other details, in some cases superannuation allowances, and the fact that an official once appointed cannot easily be got rid of, whether his services are required at a given time or not, which tend to render the system an expensive one. A borough surveyor's work or that carried out by a town clerk or medical officer must in the nature of things be continuous, or nearly so, but the demand for buildings (even by a large public body) is frequently intermittent. Accordingly the tendency must be to create a staff which can deal with work at a period of maximum pressure, which staff cannot be got rid of when

work is less plentiful, whereas the outside architect is paid for what he does and that alone. The tendency induced by the official system is to make work in slack time and to press its necessity on members of the public body who are frequently very naturally largely in the hands of their expert advisers. For these reasons we believe the system is not an economical one for the public either indirectly in leading to the employment of the most competent men or directly in saving by means of paying less in salaries than in fees.

We do not quote figures, as these are difficult to obtain, nor are they of very great reliability or value until they have been carefully examined by independent authorities who have no case to make out either for or against the system.

Another point of the greatest importance to be considered concerns the effect that the growing practice of appointing officials will have on the profession at large. It is easy to foresee a time in which the practice may have grown to such an extent that nothing but a church or a house may remain in the hands of independent practising architects. A fair number of chief officials, say 150 to 200, would be needed at the heads of great departments in different parts of the country; besides these there will be no place for any but subordinates working in different capacities under the heads. These men, some of them good, some indifferent, would for the most part have no chance of making a name by any individual work, however good it might be. The credit of any such work would naturally go to the chief. And another absurdity of the system comes in here. The chief of a big department might be a first-class designer, but the official and routine work involved—seeing committees, supervising, and like matters—is so great that he would have little or no chance of exercising his powers of design. We claim that under the completely organised official system the profession of architecture could offer but few inducements to men of the highest class of ability, unless indeed all other callings are destined to be "municipalised" in a socialistic world, and then all that can be said is that we should be equally unfortunate with others.

We feel that the system cuts clean across two of the greatest inducements to create great architecture, which are the ambition to excel and the natural wish to obtain the individual credit for what is done. Both desires may be selfish, but, though we may be altruistic in contemplative moments, most of the progress in the world has been due to the sense that individual effort resulting in success brings with it an individual reward. We repeat—the safe berth under an official régime will not be a sufficient inducement to attract the best man; the chance of rising to the head of an official department will carry with it the certainty of having insufficient time for the chief work of an architect, design; the whole tendency will be to starve the greatest of the arts by making those who wish to practise it do so in a socialistic treadmill; we shall encourage the humdrum man who wishes for a safe

billet at the expense of the man who has gifts and ambitions.

We are not discounting the excellent work which has been produced under official systems both for the London School Board and the London County Council; the former, however, was the work of an architect appointed in the infancy of a great movement and an opportune psychological moment, and however excellent many of the more recent schools are in planning and arrangement, they do not reach the same standard in design as those carried out under Mr. Robson's régime. We think that the excellence of much of the work of the County Council is due to the fact that the services of several hundreds of men are available who are largely squeezed out of private architectural practice by the fact that a large bulk of the work in London is the monopoly of the County Council, and, judging by the contemporary public work, there is no reason to assume that the work done would be less efficient or less good if it were placed in the hands of outside architects.

There is little in the argument that only continuous practice in designing one class of building is necessary for the best solution of a given problem to be reached, and that for this reason the official system is the best. In almost every large competition competition may be divided into two groups—those with special knowledge of the subject and those without any such special knowledge; success falls, if anything more often into the hands of a novice in a particular type of building. The fact seems to be that general aptitude and practice in design is the essential required, and, having acquired that, the designer can readily acquire the special knowledge requisite for a special type of building.

In summing up the case we may say that there are, in our opinion, positions in which the services of official architects are urgently needed, but that these positions are those of an advisory and not an executive capacity. There is ample room for the services of men of ability in advising municipal bodies on general schemes of development, in laying down broad lines which should govern their policy, and in seeing that public rights are not infringed upon. But a mistake seems to us to be made when (as in the case of the London County Council) it is given to one and the same authority to act in both the administrative and executive capacities, for in the one they are judging the suitability of outside architects' work, and in the other they are in direct competition with them in supplying public wants.

The work devolving on the head of the architectural department of a body like the County Council is greater than that which the most able member of the profession can be reasonably expected to deal with; the mere organisation of a staff of 400 or 500 men engaged (not in manual, but in mental capacities) would be considered an impossibility for any architect in a private capacity even though he would be unfettered by the enormous responsibilities which fall on the shoulders of the official advisers of the London County Council.

We may appear to some to take an exaggerated view of the position, but it is reasonable in considering it to think that its ultimate extension will lead to it. It is logically right and reasonable in the case it should be in another, and follows that if every school and training college which is supported and paid for out of the rates can be dealt with by local architects for the 6,000,000 people of London, the same reasoning may be applied to the same result throughout Great Britain. The City Corporation instituted a competition for the Central Criminal Courts; the County Council, on the other hand, propose to give their architect the new Sessions House. We may be sure that more and more public work will be carried out as time goes on at the public cost. The question is decided is whether or not we wish the architectural profession to occupy the position of Civil Servants.

THE ARCHITECTURE OF NEW DELHI.

THE *Times* of the last week has contained some notable contributions on the question of the type of architecture which can be most fittingly adopted for the new centre of Government of the Indian Empire. These closely follow on the theme suggested by our leader on Imperialism and Architecture in the issue of September 27. In the *Times* of the 3rd the subject is discussed in a long and able article by Mr. Herbert Baker, as well as being referred to in a leader, and on the 7th Lord Curzon has contributed an interesting letter full of sound suggestion, and the subject is further dealt with in a letter by Mr. B. B. Havell on the 8th.

We are glad to note that both Mr. Baker and Lord Curzon agree in considering that it would be a mistake to allow any native style. The latter aptly puts it that "First and foremost it is the spirit of British sovereignty which must be imprisoned in its stone and bronze"; and also "If the question is left to politicians they may not improbably, as is their wont, seek some spurious compromise which would be defended as a generous appeal to the natives of India in their art and history."

Mr. Baker discusses the various styles which might be adopted, dismissing Moghul and Saracenic architecture as being alien to Hindu sentiment, and concludes by pointing out that in our own architecture of the period of Wren and Chambers we have a basis on which we might reasonably work for the new capital, and points out that the very fact which rendered the adoption of the architecture of the Renaissance here a slow and gradual process was its greater suitability to such a climate as that which is possessed by India.

Lord Curzon, in rejecting the idea of trying to adopt any Eastern style, says: "What will be the use to which the new buildings will be put when erected? Will it be a use that finds any parallel in the purpose for which the masterpieces of Indian architecture were raised which excite the admiration of every observer?"

In a following paragraph he very ably analyses the entire differences which exist between these two purposes, and sums up a convincing letter by suggesting that a "colonial adaptation of the Palladian style" is that which appears to be most suitable for the new capital, but adds that he is "far from suggesting that it should be reproduced in its severe and inartistic simplicity at Delhi," and that it "might be possible to adapt some richer and more imaginative variant of the classical conception" as evidenced in Spain and other southern countries.

He feels that the selected architect "may in the models which he sees round him, in the spirit of the East, or in the talents of native craftsmen," find something which will "give a similar native flavour, a native *aura* to the forms of the West."

Mr. Havell's contribution to the controversy is one of the familiar appeals to build in the indigenous style of the country, which, we feel, is hardly sound, nor does the claim rest on a sufficient logical basis.

India is not, and never has been, "a country." It is a convenient geographical expression for the land lying to the south of the Himalayas; a land which is an epitome of a continent, containing people of every conceivable religious creed and race; a land which has not, even in the great days following the Moghul conquest, been completely under one sovereignty till the days of our own Empire. When Mahometan hates Hindu and Hindu Mahometan, and where both consider the Buddhist and Christian alike as followers of illusions, it would, for political reasons alone, be a mistake to adopt a style which must be identified with one and not all of the races which alike are ruled by the British Raj.

Nor is there any reason why we should work in fetters because those of another faith have done so. The Mahometan must eschew all forms of nature and life in his ornament, contenting himself with intricate pattern-work. The Hindu styles are characterised by a mass of ill-digested ornament having their basis in a mythology alien to us and to Mahometan alike.

While we agree with the greater part of Mr. Baker's article, we feel that it would be a mistake to adopt an English type of Renaissance for our starting-point, because it has been by Wren and Jones so absolutely adapted to the wants and requirements of our own climate.

The starting-point should, we believe, be that of the purer and more ascetic type of the Italian Renaissance, the true heir and successor of Roman architecture modified to suit the wants of modern life, and even here there must be reservations and differences imposed by the circumstances of the problem.

The Italian Renaissance was the product of a period in which some of the greatest and most gifted of individual art-workers lived.

It would be clearly impossible to import into India great numbers of individual workers; the bulk of the work must be such as can be consistently carried out by natives. This means the general avoidance of sculpture other

than carving, which may be described as "ornament," a greater determination to seek satisfaction in mass and simplicity and a general avoidance of what is complicated and difficult in construction. We believe in building in all Eastern countries it is also necessary to allow for the fact that the native workman has to use materials not as good as those generally used here; allowance has to be made for a greater surplus of strength and mass than would be necessary under European conditions. All these difficulties will not, however, prevent the carrying out of architecture in a broad Imperial spirit like that which distinguishes Roman architecture, and we may hope that, fired by the determination to mark fittingly the greatest glory of our history—the wise and beneficent government of the toiling millions of India—our architects may take a departure which will add new achievements to the history of architectural development.

ON BEAUTIFICATION.

AS a pastime we have lately visited a number of old churches, pointing out to our companion this and the other thing of interest—a Norman chancel arch, mediæval arcading, a window, anything, in fine, representing style in the manifold variety of many centuries, or which helps to explain the growth of a building from its foundation—to make conversation upon, or to criticise indulgently, as one does unconsciously with all old things. The red-lacquer and gold of some poppy-heads, fragments of ancient glass, an epitaph more curiously worded than the wont, or a fine piece of groining would move us with a fresh delight again and again. Yet—and we speak it with sorrow—our delight was tempered with regret, for always some base metal peeped out blatant and unmistakable from the fair coin stamped by the centuries. The alloy was the XIXth century.

We do not here speak of "Restoration," which is bad enough, but for which some excuse may be found in the inclemency of our climate, but of "Beautification." It would be almost safe to say that no church in England, however poor, but has found money to indulge itself in this vice. The metropolitan cathedral of St. Paul called it "decoration" and covered its walls with mosaics, until either from lack of funds or adverse public opinion a period was put to the works. It is supposed to be an added merit that these decorations are done after an ancient mode, that the tesserae are laid *in situ* with wide interstices between them. We have, however, seen the mosaics of St. Mark's, at Venice, and those at Palermo; we have, again, seen some of the most exquisite panels built up of minute tesserae taken from Pompeii, and do not find that the St. Paul's mosaics bear any resemblance in style or effect to either of these kinds of works. It does not matter to which goal we aim so long as we arrive there, but when we attain elsewhere it were wise not to notify our ineptitude to the world.

These decorations are neither better nor worse than many we have seen lately;

only from the publicity given to them, from the importance of the building in which they have been placed, they are known to everybody.

This recollection was induced by a pulpit, "remarkable," as the guide-book says, "for its beautiful modern mosaics by Dr. Salvati, of Venice," but which in reality is a very indifferent specimen of a poor kind of work. Not to put too fine a point on it, the pulpit is vulgar—its effect, placed as it is in the dimly-lighted space in front of a splendid chancel, which is raised by many steps to an unusual height above the nave, is like the braying of brass instruments, breaking the fine filigree of Mozart music. This is not all, for the reredos is little better; it does not, it is true, strike so blatant a note as the pulpit, it is merely a discord. It "has figures carved out of a single block of Carrara marble by Mr. —, R.A.," and represents "the Entombment of Our Lord." The inference is that the reredos acquires merit because of the material in which it is made, or because of the fragment of the alphabet at the conclusion of the author's name. We have seen so many beautiful "entombments" that we looked naturally for imagination, dignity, knowledge of the human body, for some quality capable of invoking pity, in this work. We could find none, nothing to touch one with a sense of reality, with any sense of beauty, with the Divine significance of the subject. A Victorian sentiment seems to pervade the whole conception, to inspire the stiff attitudes of the ministering angels, filling out their poor draperies with we cannot express what insipidity. But enough, it is unnecessary to give its details, which are all conceived in the same spirit.

Our peregrinations brought us to the top of a considerable hill, whence, on a fine day, can be seen the coast of France. It was once a Roman town having a port at the foot of the hill. Now a small Norman church rests there like a lonely tired sentinel, looking over the changeless sea. Obviously it has stood for many centuries, and will stand. It has not been much restored; many curious features telling of exigencies in the construction are still apparent. The story is so easy to understand that he who runs may read. Yet the "beautifier" has introduced a solecism into the direct and simple narrative. At the east end, above the altar, he has introduced a row of trefoil arches filled in with saints in mosaic; whether laid in the ancient or modern manner does not really matter, for they are very garish and ugly. Nothing could well be more unnecessary, nothing more certain to blot the fine "scutcheon of simplicity" which the tiny building displays. Yet obviously it was a thing of cost, this mosaic, and the church goes naked of proper benches and the like.

Perhaps it is only a font which obtrudes its commercial origin into what has always been a work of love, but it is sufficient to show the careless tendency of that dreary penultimate period, late Victorian. In our wandering we saw several of these, whose trite symbols were elaborately explained in the printed cards put up for the information of visitors, but which, beyond their very obvious utility, could have no kind of æsthetic purpose

whatever. Many of the churches were decked out with imitation mediæval pews in pitch-pine, with machine-cut poppy-heads at so much a hundred; others, again, had bright-brass altar-rails, pseudo-Gothic in the ornaments, XIXth century in the essential or rigid constructional portion of the thing; some were "beautified" with cheap oil-lamps, some with cheap lacquered brass memorial plates. And yet cheek by jowl with them would be splendid Dutch candelabra with their great bulbous bodies and tier upon tier of candles, or mural tablets with goodly lettering, or those quaint old brasses with stiff effigies of knight and lady engraved on them. The pomp of heraldry in all its richness and variety finds a place on the walls of these churches side by side with whitened sepulchres of the same in white marble.

The goodly carpet of the earth with its flowers, the floor of the sky "patined with bright cloud," are things to which the Church turns continually for illustration of what is comely and beautiful. Yet she fills her chancels with flooring of the most garish kind. The rude paving of quarry-tiles or stone, the fairer pavement of marble, are replaced by painted tiles of the most mechanical and ugly kind, without any apparent sense of the incongruity of such a proceeding.

These things, and many others which it would be too tedious to enumerate—bad as they undoubtedly are—are not yet so flagrant as entirely to spoil our pleasure in an old church. But the modern stained-glass window does. We do not wish it to be thought that we deprecate the work of certain artists in this most difficult branch of art. We wish them well, and only desire to see more of their work, but the usual kind of stained-glass window we should like never to see again. In one church, during our pilgrimage, we saw designs for such windows, pinned up with the intention of extracting money from the sentimental traveller to convert them into glass. Each design was marked with a price, significant enough of the kind of work to be expected, if that were not clearly enough implied by the firm of glass-stainers whose signature flourished in a corner of the drawing. We tried to fortify ourselves with the recollection of windows we had seen in Florence, hung up, with richer colours dight than those of Nature, between ourselves and the light; of the rich mantle of colour formed by the windows of York; of the flamboyant glory of the late glass of Fairford Church, without being able to reconcile ourselves with these designs.

A dim religious light is not obtained by shutting out the light of day; it is rather a quality derived from certain principles of design, which begin with the foundations and work up through "the fretted aisle" to the roof. As larger windows became the fashion, the poet's "dim religious light" was banished until the daily coming on of evensong. But the modern system is to break up the light by means of painted glass in a million kaleidoscopic colours. Better far is the window of plain quarries! We all laugh at "Munich glass," but "much modern glass is in effect little better.

Yet our pastime has not proved unfruitful, for we have seen many old

churches whose every stone is pregnant with story, and which have a soul of their own that cannot altogether be destroyed. Yet it seems most regrettable that the clergy and their congregations do not take the best advice before "beautifying" their churches. In most cases they have a noble nucleus to work upon, very often from a religious and human point of view beyond the means of modern art. Yet they encourage and give admission to what is not art at all, but a spurious thing bought and sold at shops.

NOTES.

WE are used to blame the Profession and not to pity, which renders us doubly grateful for a letter in the *Westminster Gazette* by Harold Begbie, entitled "The Profession and its Rewards." We often feel we are not paid, but it is balm to our souls to be told that this is indeed so. Mr. Begbie points out the ridiculous remuneration which an architect receives for his labours in designing a small house as compared with the literary agent or other professional worker. "Men," he says, "become architects because they love the art, or because they have no energy to do anything else."

We have heard of many reasons for the choice of an architect's career, some good and some bad, but never the latter, and we should be inclined to say that such a man would find he had made a grievous miscalculation, as we think few callings require more energy and, we might add, patience. But as to the question of remuneration, we feel the profession may complain somewhat unjustly. The bulk of people who build small houses have to consider every pound. The abused 5 per cent. is a minimum, it is for us to say whether we will charge more, if we can afford to let the work go. Very often it would mean our possible client going straight to a builder. We quite agree with Mr. Begbie's graceful appreciation of the work of our younger men.

THE *Times*, in a short article entitled "City Traffic and St. Vedast's," in its issue of the 5th inst., calls attention to the dangers which may threaten St. Vedast's if the question of the new Post Office extension is not considered in relation to possible traffic developments, which will be rendered still more urgent when St. Paul's Bridge is opened. In saying that "the opinion of competent architects should be taken before great works involving large architectural issues are sanctioned" the *Times* is doing service both to architects and to the public. We called attention to this most important subject some weeks ago (p. 195), and in this issue publish a further letter on the same subject, and we are of opinion that these suggested plans should be carefully considered by those in authority before being relegated to the limbo of impossible schemes.

St. Vedast's and the Traffic Problem.

Sketch Design for Almshouses in a Country Town. By Mr. C. P. Wade.

Croydon By-pass. THE Croydon Borough Council having at last adopted a scheme for a new road from Thornton Heath to Purley, which will divert the through traffic from the centre of the town, it is to be hoped that at last has been heard of the threatened destruction of Whitgift Hospital, against which we have so frequently protested. Archaeologists and lovers of antiquity may now join hands with town-planners in approval of the scheme. There is little doubt that in the great majority of cases this method of beating by-passes where main traffic routes pass through towns and villages is sound one. Where the widening of the main street of a town would involve the destruction of artistic or historic monuments it is the only conceivable one. Properly handled, a new road skirting a village or town may be made a source of added beauty. The junctions with the old road more particularly afford opportunities for some skill in arrangement, if only in the artistic grouping of trees. No doubt the Croydon Borough Council will bear in mind this aspect of the question. Owing to the general road widening that is now in progress throughout the country this problem may be expected to present itself frequently, and will, we hope, be solved in the same way.

The Grosvenor Gallery. A new gallery for the exhibition of pictures has opened in Bond Street and taken the name of the Grosvenor Gallery. We do not happen to know under whose or what auspices it is started, but Mr. Martin Wood's name appears in the catalogue as Secretary and Curator, and, apart from the present exhibition, the exhibitions of the International Society, the National Portrait and other societies are to be held within its walls. In the months of June and July we are to have an exhibition of the works of Albert Besnard, which will be welcomed by all who are interested in French painting. The galleries themselves are charming, and the method of hanging and arrangement of the present show are adhered to in future exhibitions we shall be able to look at pictures with much greater pleasure than is the case at most galleries. The crowded element which we are accustomed, and which is not less trying to the pictures themselves than to the spectator, is wholly absent. All the pictures are shown to

excellent advantage; there is no confusion or awkward contrast, so that the general effect is serene and harmonious. The inaugural exhibition is promising. It is not restricted to unexhibited works, but the admirable arrangement, in which there is no skying, often presents a familiar work in a new and more attractive aspect. We noticed this particularly in regard to a picture of Mr. Strang. The artists represented are among the more advanced men of the British school, including the present and future Academicians of the Chelsea group. Mr. Philip Connard, Mr. Alexander Jamieson, and Mr. G. W. Lambert all show characteristic work. The entrance hall is occupied by some striking lithographs by Mr. Pennell. Mr. Charles Sims has "In the Coming of Spring" sent one of his happiest compositions, in which a nymph and children (there is genuine inspiration in Mr. Sims's observation of the charm of infant life) are disporting in an Italian landscape. And there are many other delightful works. But the exhibition conceals a mystery. One of the rooms is devoted entirely to the work of Walter Greaves. We were unable to ascertain from our cursory glance that any of these pictures had a date or a signature. On entering the room we felt momentarily that we had been transported to the gallery at Millbank, where Whistler's nocturnes and symphonies have recently been on view. Here were all Whistler's effects over again—the "Cremorne," the "Grey and Silvers," and the rest. What is the explanation of the mystery? Has Mr. Greaves up his sleeve, as it were, further stores of accumulated works with which to fill galleries at request—or what?

THE POST-IMPRESSIONIST EXHIBITION.

THERE can be no finality in artistic points of view; opinion here, as in other regions of thought, is susceptible of ebb and flow, and readjustments will from time to time occur which make for artistic life and progress. With the best will in the world, however, we are unable to sympathise with the intellectual readjustments which the present exhibition of the Post-Impressionists at the Grafton Galleries would impose. Nor do we take the show of pictures altogether as a joke. We know too much about the history of the movement for that. It is certainly no matter for mirth to its disciples, and it has secured adherents among men of

eminently serious ability both abroad and in this country. The movement cannot very well be dismissed as one of no importance. To ourselves it is interesting not as a manifestation of art, but as a curious intellectual phase of the human spirit in the early part of the XXth century. The Post-Impressionist movement is not an art movement; it is essentially a movement of criticism; it is, we daresay, in some of its aspects idealistic; it is, above all, a movement of theory and experiment. We suggest that it is a movement of criticism because it seeks to revolutionise hitherto accepted standards, and it is idealistic because in a spirit of strange asceticism it rejects any appeal to the merely sensuous. We are not prepared to discuss its theories, not because they appear to us illogical and, in some instances, irreconcilable, but because any new appearance in art is not a matter of theory and criticism but of creation. In a general way the history of art may be summed up, first, by the painting of this picture or that, by the modelling of this piece of sculpture or that; this is followed by the explanation of the person who looks on, the critic, as to the impulses which stirred the artist in the birth and elaboration of his conception. Here æsthetic considerations and theory step in. So far as the artist himself is concerned, he is often silent, but if he formulates a theory at all it rarely precedes the creation of his work. Theory in any case with an artist is, in the first instance, subconscious, and if it is developed later it is usually formulated according to the measure of his own competence in a certain given direction; which is to say that it is personal, not abstract. There is in nature no such thing as an artist whose theories are not influenced by his own capacity. All, however, that we wish to imply is that theory does not precede artistic production, but follows it and completes it. And so it is with the Post-Impressionists, or rather (because there is a difference), so it was. If we trace for a moment the history of the movement, what do we find? We find that the end of the last century produced in France three artists of intense individual talent (it is too early yet to call it genius), Cézanne, Gauguin, and Van Gogh (who was of Dutch extraction), who were drawn to the art of painting by some natural and idiosyncratic desire for that form of art expression. They painted, for the most part, pictures that were unsaleable, or only saleable at a price which provided not a living, scarcely *du pain sec*; their brother artists and the critics said that they could not draw and could not paint. They lived more or less their individual lives in poverty and died without any sort of recognition that could matter to them. Two of them, at least, Van Gogh and Gauguin, probably desired to paint the same sort of pictures as their more successful fraternity among the Impressionists, but they were barred by their own freakish and personal instinct, by their limitations, by what we

may call defects in character, from attaining the artistic standard of their period. They could not subordinate their temperament, their view of nature, and the general spectacle and emotion of things, to conditions other than those which had been imposed upon them by their own temperament; and they probably found small consolation for their want of success in the fact that they could not be other than themselves. It would be absurd to argue that these men were the slaves to a conscious artistic theory, that their life was devoted to the fulfilment of a programme in aesthetics, or that they were propagandists in a new cause: although they were probably all these. That they could not draw or paint is now almost a forgotten animadversion. So far as drawing is concerned, we have only to look at the photographs of their work which are on view in the small room on the staircase which leads to the exhibition at the Grafton Galleries to realise that it possessed qualities denied to artists of more correct performance. Those who were wont to laugh at their work do so no longer. Collectors and dealers have begun to find their profit in these so-called "Old Masters" of the Post-Impressionist movement, and trade does not throw away its money on works of art which have not an intrinsic as well as a commercial value. Critics have built up artistic theories on these productions, and later painters have imitated them. The result is the present exhibition at the Grafton Gallery—and Henri Matisse!

In many respects the exhibition is frankly ridiculous. It is an exhibition of theories, and of absurd theories. The field which they offer for genuine artistic incompetence is sufficient proof of it. It would not, we think, be difficult, in any case, to show the fundamental error of formulating a series of art principles on the work of the artists who are hailed in this movement as its precursors. With some few exceptions (and we would particularly include the Russian group of artists whose work often expresses real visionary power), the members of the Chelsea Arts Club could within a month provide a show of equal merit without asking us to take it seriously. Sincere and creditable art does not lend itself so readily to facile imitation. We have, we believe, read most of the literature which has been published on the Post-Impressionists; it makes delightful reading; it is so eminently serious and well done. In the quality of this writing there is not a touch of Post-Impressionism, and the arguments which occasion it are worth thoughtful attention. But the illustrations, as presented at the Grafton Gallery, do not justify all this bolstering up. The time has probably arrived when we shall see some change in the painter's convention; in every phase of art, as indeed in every phase of life, there are suggestions that the modern world is in the travail of a Renaissance. The outcome will undoubtedly involve new points of view; it may establish a new order of things. We are all perhaps waiting for it, some so anxiously that even such passing expressions of misapplied theory and affectation as the exhibition at the Grafton Gallery are, for the moment, taken seriously.

THE BRITISH SCHOOL AT ROME: SCHOLARSHIP IN ARCHITECTURE.

Candidates who are eligible to compete in the Open Qualifying Examination for the Scholarship in Architecture at the British School at Rome, offered by the Commissioners for the Exhibition of 1891, particulars of which were announced in the *Times* on August 17, must apply in writing to the Hon. General Secretary, British School at Rome, 54, Victoria Street, London, S.W., for particulars of the subject set for the examination on or before October 31. The subject will be forwarded by post on November 5 to intending candidates, who must be careful to write distinctly in their applications their full names and addresses.

TOWN PLANNING FROM AN ENGINEERING ASPECT.

At a meeting of the Society of Engineers (Incorporated), held on Monday, a paper on "Town Planning from an Engineering Aspect" was read by Mr. Ernest R. Matthews, Assoc. M.Inst.C.E., F.G.S.

The author divided his subject under two main headings:—(a) Town planning in a residential district, and (b) Town planning in a manufacturing area. He illustrated the former by a brief description of Bridlington's town-planning scheme, and stated that one of the principal points to be considered in the preparation of a scheme was the direction, width, and method of construction of main arterial, secondary, and subsidiary streets. He suggested that these should be 75 ft., 50 ft., and 28 ft. or 30 ft. in width respectively, that they should be constructed of tar macadam with grass margins, asphalt footways, and trees, and that the buildings should be set back 25 ft. in the 75-ft. and 50-ft. streets, and 20 ft. in the subsidiary streets. He gave a description of the method of construction that he would recommend for the foundation of the streets and for the tar macadam roadway. The author did not agree with the idea of making the foundation of the roadway in a subsidiary street less substantial than that in a wider street. He deprecated the practice of putting in heavy kerbing and flagged footways in residential districts, and thought that grass margins with asphalt footways not only effected a saving in cost, but presented a more rural and pleasing appearance. He thought that the road requirements of our by-laws were unreasonable, and resulted in houses being built with a narrow frontage and deep back, instead of a wider frontage and shallow back, which he considered far preferable.

In designing a town-planning scheme it would sometimes be found necessary to allow for the widening of some of the existing roads, and also of the diversion of certain public footpaths; this had been so at Bridlington. Open spaces should be left for parks, tennis-courts, bowling-green, children's playground, garden enclosures, sites for public buildings, etc.

The sewerage and sewage disposal of the area were matters of great importance, and the engineer must ascertain if the existing sewers and disposal works were capable of taking the drainage from the proposed area, also whether the levels permitted the area to be drained into the existing sewers, and he must devise a scheme for dealing with the storm-water. The lighting of the area by means of gas or electric light was also a matter of great importance, as was that of water supply.

Town planning in a manufacturing area was very different from that of a residential area, and the points which must be considered include:—(1) The position of the proposed industrial area; (2) its proximity to railway sidings; (3) the facilities for vehicular traffic to and from this area; (4) the necessity for constructing any new roads leading to this area in a substantial manner, so that they would carry

the heavy traffic likely to come upon them (4a) the provision of roads for rapid and local traffic; (5) the area to be occupied by workmen's dwellings; (6) the supply of electric energy for power and lighting purposes; (7) the position for wharfage if water carriage available; (8) supply of water and gas; (9) sewerage and sewage disposal; (10) disposal of storm water; (11) size of area; (12) direction of prevailing winds; (13) advisability of constructing subways under the main arterial road. Several other points were of equally great importance from the engineer's point of view.

THE NEW GRESHAM COLLEGE, E.C.

THE site of the new Gresham College is a main frontage of over 71 ft. to Gresham street, and a return frontage of over 58 ft. to Basinghall-street. The building is now in progress. Portland stone will be used.

The contents of the building will be as follows:—

The basement will contain large lavatories, heating chamber, and ample provision for storage purposes, etc.

The ground floor will contain the Great Hall about 65 ft. long by about 40 ft. wide; this with a gallery at one end, will provide accommodation for about 500 people. There will be a retiring-room for the professors, and a main entrance hall in Basinghall-street; there will be two large folding doors as extra exits direct into the street in case of alarm. There will be an electric lift from the entrance hall for access to the gallery and all upper floors.

The first, second, and third floors will be available for letting as offices. Each will be divided into rooms as required by the tenants. Certainly eight good rooms can be provided on each floor. The committee-room and office of the Gresham Committee will be on the third floor. The fourth floor will contain six offices and rooms for the caretaker.

By an arrangement with the Corporation of London an agreement was entered into which has enabled the Gresham Committee to build a much finer hall than was at first contemplated. The right of way into Basinghall-street has been abolished, and will be built upon, and the yard between Gresham College and the City of London Court will be partly built over, consequently the Great Hall is nearly 5 ft. wider for its entire length than it would have been had the arrangement not been made, and the entrance hall will be 6 ft. wider and about 5 ft. deeper.

The agreement entered into is mutually beneficial in that the City of London Court can now be raised considerably.

The design for the building (p. 407) was exhibited in the Royal Academy and will be carried out subject to certain alterations made by the Gresham Committee—e.g., there will be no bay windows or main pediment to the Gresham street façade.

The contractors for the foundations were Messrs. Cubitt & Co., and the contractors for the superstructure are Messrs. Holloway Bros. The total cost of the building will be about 28,000*l.*

The architects are Messrs. Sydney Perks and Dendy Watney.

GENERAL NEWS.

The New Penny Postage Stamp.

The new penny postage stamp has been issued. The head of the King is the same as in the new twopenny stamp, which was issued a few weeks ago. The head of the King is the same as on the coins designed by Mr. Bertrand MacKenna, A.R.A.

Middlesex Memorial to King Edward.

The Duke of Bedford presided on Tuesday at the Caxton Hall at a meeting of the Executive and General Committee of the Middlesex Memorial to King Edward VII. After inspecting the work of nine different sculptors who had at some time or other executed likenesses in marble of the late King the Sub-Committee recommended to the Memorial Fund Mr. P. Bryant Baker, of Fulham-road, Chelsea, for the execution of the bust of King Edward which is proposed to place in the Middlesex County Hall at Westminster. It was agreed that Mr. Baker should be commissioned to execute the bust.

The New Gresham College, E.C.

Sanitary Institute Congress at Exeter, 1912. The Council of the Royal Sanitary Institute accepted an invitation from the City Council of Exeter to hold the next Congress and Exhibition of the Institute in Exeter from July 7 to 12, 1913.

The Guildhall Improvement.
A special meeting of the Corporation was held at the Guildhall yesterday to discuss the scheme and plans submitted by the City Council Committee for the improvement of the Guildhall. Three amendments were on the agenda. Mr. Brinsley-Harper proposed that the scheme be referred for consideration and report to three architects to be nominated by the President of the Royal Institute of British Architects and approved by the Corporation. Mr. J. Ganton, F.R.I.B.A., suggested that the Guildhall should be entirely remodelled to allow a proposed Court on either side of the Guildhall-yard to be properly planned, lighted, and ventilated—the whole being dominated by the West Gallery—and that the design generally could be revised with a view to keeping the height of the new buildings of the east and west wings of Guildhall-yard below the height of the existing front elevation. Mr. H. P. Monckton,

F.R.I.B.A., suggested that the Committee should obtain designs from six architects to be selected by the Committee and submitted to the Court for their final choice of one of them.

The Danger in the Use of Celluloid.
The Home Secretary has appointed a Committee to inquire and report as to the precautions necessary in the use of celluloid in manufacture and the handling and storage of celluloid and celluloid articles. The names of the members of the Committee are:—The Earl of Plymouth (Chairman); Professor James J. Dobbie, D.Sc., LL.D., F.R.S., Principal Government Chemist; Captain Maurice B. Lloyd; Mr. H. M. Robinson, Deputy Chief Inspector of Factories; and Mr. Edwin O. Sachs, F.R.S. (Edin.) Chairman of the Executive of the British Fire Prevention Committee.

The "Dip" in Piccadilly.
In view of the rebuilding about to take place on the site between the Savile Club and the Junior Athenaeum Club, the Westminster City Council approved a plan prepared by the City Engineer showing an improved level which would get rid of the existing "dip," provided the necessary arrangements could be made.

The plan also proposed a setting back of the railings of the Green Park to allow of a widening of Piccadilly westwards from the Ritz Hotel. In a report which was to come before the City Council yesterday the Improvements Committee recommended the Council, in view of the opposition to the proposal, not to proceed further with it at present. The report shows that the Savile, Isthmian, and Junior Constitutional Clubs object to the scheme for raising the "dip."

Lectures on Reinforced Concrete.
A special lecture and practice course of fifteen lectures on "The Principles of Design in Reinforced Concrete" is being delivered at the London County Council Westminster Technical Institute, Vincent-square, S.W., by Mr. Percy J. Waldram, F.S.I., on Fridays at 7.15 p.m. The series commenced on the 4th inst. The course is designed to meet the needs of architects and architectural draughtsmen. The theory and construction of all formulae are explained, and a large number of diagrams have been prepared by means of which the formulae can be used without calculation. Arrangements have been made for making and testing experimental beams and members.

The New Gresham College, E.C.
Mr. Sydney Perks, F.R.I.B.A., and Mr. Dendy Watney, Architects,

(Royal Academy Exhibition, 1913.)

Examples of design will be worked out during the lectures, which will be illustrated by diagrams, models, experiments, and lantern slides.

Disfigurement of Runnemede.

The Egham Urban Council have resolved to ask the Postmaster-General to accord his consent to the laying underground of the telephone cables across Runnemede, instead of the erection of unsightly poles. The matter, we gather, has also engaged the attention of the Society for the Protection of Ancient Monuments.

Kingston Bridge.

Operations for the widening of the bridge have just been begun, and a temporary bridge will be erected for traffic when the present bridge is closed. Mr. Basil Mott, C.E., has made the plans, which will involve an outlay of some £4,000, for constructional work that will occupy about eighteen months.

Dee Bridge, Chester.

Sir Francis Fox, C.E., has made an examination of the old Dee Bridge, and, in the result, steps have been taken, under his advice, to repair some cavities in the masonry caused by the continued scouring effects of the stream. The bridge was built towards the end of the XIIIth century at the crossing of the river, guarded by the castle, on the south side of the city.

British Museum.

The principal trustees have appointed Mr. George Francis Hill as keeper of the Department of Coins and Medals in succession to Mr. H. A. Grueber, F.S.A., who retires from the service; and Mr. John Alexander Herbert is appointed assistant-keeper, Department of "Coins of the Roman Republic in the British Museum," 1910, 3 vols., the subject being treated geographically and chronologically, with catalogue, tables, indexes, plates, etc. Both Mr. G. F. Hill and Mr. J. A. Herbert are the authors of important books. Mr. Hill is known not only by his works on numismatics and allied subjects, but by his "One Hundred Masterpieces of Sculpture"; and in 1911 Mr. Herbert published "Illuminated Manuscripts," the result of much research. The retirement at the close of the current month, after forty-two years' service, is announced of Dr. G. K. Fortescue, keeper of Printed Books, who compiled and printed a most useful catalogue of books upon British topography in the Museum.

The National Trust.

The National Trust appeal for 600*l.*, the balance of the purchase price, 4,000*l.*, to save from building operations (already begun) the head of Windermere and of Borran's Field, where, and around, have been found the remains of an important Roman settlement, with a fort constructed of stone. Contributions also are asked towards the purchase of Finchamstead Ridges, being 60 acres, and portion of the late Mr. Arthur Walter's Bear Wood estate, Berks, at a price of 3,000*l.*, towards which Mr. John Walter has promised 500*l.*, and further subscriptions of 2,000*l.*, or more, have been made. The acquisition of the land will preserve the fine prospect westwards and southwards to as far as Highclere Beacon and Hindhead; nearer are Eversley, Strathfieldsaye, and the valley of the Blackwater, with Winchfield beyond.

Art Exhibitions.

Mr. Gordon Craig's exhibition of models and designs for the New Theatre at the Leicester Galleries will close on Saturday, 12th inst., when on the same day there will be opened an exhibition of paintings and drawings by Mr. George Clausen, R.A.

Later in the month Mr. Arthur Rackham's water-colours illustrating "Æsop's Fables" and some new drawings for "Peter Pan" will be shown in these Galleries, together with the collection of nearly one hundred drawings by the late Phil May formed by Mr. Lear J. Drew.

The Arts and Crafts Exhibition Society, founded in 1888, will hold their tenth exhibition at the new Grosvenor Gallery—a gallery just erected at 51A, New Bond-street—during the months of November, December, and January next. It will be remembered that this Society has been in the habit of holding triennial exhibitions since the year 1900, and that these exhibitions have never been run for profit, the

Society being satisfied if its expenses are paid, as the main object is to find opportunities of placing the best English contemporary work in design and craftsmanship before the public. Mr. Walter Crane is the President and Mr. Edward S. Prior, Hon. Secretary.

BOOKS.

Porches and Fonts. By J. CHARLES WALL. (London: Wells Gardner, Darton, & Co., Ltd. 10s. 6d. net.)

THE porch as a feature of ecclesiastical architecture often commands an individual interest. As the duality of the title of this work indicates, however, the author views his subjects from the standpoint of ecclesiology as well as architecture. To him the significance of the porch consists in its direct relation to the font. It is the relic of the *atrium*, the place set aside for catechumens—the unbaptised—while the font offers the first step towards reception into the privileges and ritual of the church proper. There is the other view. The porch is one of the *exedrae*, or outer buildings, referred to in early authorities as fit places for baptism, which ceremony was regarded as a purely public transaction. And the porch has certainly retained this character of an outbuilding suitable for public uses and performances of one kind and another. To many of these the author refers. It is, as we know, still the place where statutory notices are displayed. The civil arrangements connected with the marriage ceremony were conducted in the porch. Marriage settlements were there signed and sealed. Above the porch there often exists a room, known generally as a *parvise*, used as a muniment-room or library, sometimes as a school. An illustration of the fine porch and library over it, at St. Mary, Redcliffe, Bristol, is given, and due recognition is made of the remarkable flint panel work and freestone tracery that distinguished the porches in the eastern counties, as at Ardleigh and Great Bromley, in Essex, and Southwold, Halesworth, and Blyford, in Suffolk. Details of some of these porches were published in the *Transactions of the Royal Institute of British Architects*, 1884, with a paper by Mr. Frank Baggeley. But such characteristics are shared with the buildings to which they belong, and one must not push the individual claim of the porch too far. Those more distinctive porch forms, the narthex, as we see it at Lincoln and Peterborough, and the Galilee, as we see it at Chichester and Durham, have naturally not been overlooked by the author. Neither such prevalent features as sundials, stoups, and niches for the patron saints.

The special claim of the font is more readily accorded to. There are fonts whose beauty is not only of the most distinctive kind, but beauty of design of a very high order. The finest Norman fonts are pure Byzantine art, with the bowl sometimes square, as at Toftrees, sometimes round, as at Bodmin—both magnificent specimens.

The XIIIth-century font, as we find it at St. Giles, Oxford, Barnack, and Eaton Bray, is splendid also, and one may contrast the reticence of design in the St. Giles's example with the luxurious handling shown at Eaton Bray. With the XIVth century comes an obvious falling off in creative power. The bowls are small, and appear more insignificant still by their pedestal treatment and their position upon platforms. The "tub" font in Burford Church is, however, a notable exception.

When we reach font-covers, as we do towards the close of the book, it is again to find that the eastern counties show some of the best examples. Suspended with a counterbalance from the roof, or from four-post canopies, they are fine pieces of workmanship. Then there is the cabinet type, which gives access to the font by means of doors, of which there is a good example at Plymstock, Devon.

A handsome display of font-covers is, as we remember, given in an earlier work on the subject by Mr. Francis Bond. There is an earlier one still by F. A. Paley. But the present book is distinguished by possessing excellent original illustrations by the author, while Mr. Bond was satisfied with photographs, and engravings. If in this respect only, Mr. Wall may claim precedence, while we may add that those who seek ecclesiological information upon "liturgical observances" will find them duly considered.

Fire Prevention and Fire Protection as Applied to Building Construction: A Handbook of Theory and Practice. By J. K. FREITAG, B.S., C.E. (New York: John Wiley & Sons. London: Chapman & Hall, Ltd. 1912. Pages viii. and 1,038. 17s. net.)

THIS book is an outcome of the elaborately specialised study which of late years has been given to the protection of life and property against fire. That absolute safety is attainable without the sacrifice of convenience to an undurable extent, is doubtful; but great progress has of late been made in reducing risk by suitable methods of construction and arrangement as well as by increased efficiency in what have been called the "fire-fighting arrangements and staff, and the work before us gives a very comprehensive statement of the present position from the points of view indicated by its title.

The earlier chapters are devoted to the subject of fire losses and statistics connected therewith, from which the author arrives at the conclusion that the buildings of the United States are very inferior in fire-resisting capacity to those of Europe. He states that "our veritable fire waste, according to European experience, amounts to more than 360,000,000 dollars annually, or nearly enough to build the Panama Canal each year."

After a chapter on the "Theory and Practice of Fire Insurance," there follows one on "Slow burning or Mill Construction," which would perhaps come more appropriately later in the book. "Fire Tests and the Materials of Fire-Resisting Construction" are dealt with next, occupying four chapters; and then follow thirteen chapters on "Fire-resisting Design," seven on "Special Structures and Features," and nine upon "Auxiliary Equipment and Safeguards."

The chapters on materials and construction contain many notes of general interest upon modern methods of construction, that devote to the questions of permanency and corrosion of metal being worthy of especial notice. The author very strongly condemns the jerry building which appears to exist in the United States as in the United Kingdom, and attributes its prevalence to undue haste and consequent carelessness, the craze for lightness and cheapness, and to actually dishonest design and construction. He says:—"In more than 95 per cent. of the fireproof buildings erected during the last five years the mistaken economy of owners has prevented the adoption of good fireproof construction," although the difference in cost between a poor and a first-class method has in no case been in excess of 2 to 4 per cent. of the cost of the building. We have heard an architect on this side assert that a great proportion of our own jerry building is the fault of the employer or client for whom it is done—and there is much truth in the statement. The desire to get more for one's money than can honestly be had does not seem to be peculiar to any one continent! The types of construction described and illustrated are very many and of varying degrees of merit, and the explanatory comments are clear and useful. It is noted that forms of construction which may very satisfactorily resist fire are not always equally good from the standpoint of general permanency. The many forms of floors, partitions, etc., commonly used, in which steelwork is permanently hidden from view but surrounded by air-space, must, of course, deteriorate at a speed varying with individual conditions, but in many cases too rapid to be at all reasonable in connexion with important buildings.

The great fires at Paterson in 1902, at Baltimore in 1904, at San Francisco in 1906, at Chelsea (Massachusetts) in 1908, as well as many fires in very large office and other blocks, theatres, and other public buildings furnished illustrations, details of which are copiously drawn upon by the author of the actual resistance and efficiency, or the reverse, of modern types of construction.

The carefully-organised experiments made at the testing-stations of the British Fire Prevention Committee, the United States Government, the Berlin Royal Technical Research Laboratory, and elsewhere are also referred to and details cited where necessary.

The best-known special types of doors, windows, and shutters of fire-resisting glass, and other means of separating fire-risks and of checking the spread of fire, together with the arrangements and construction of fire-escape staircases and fire escapes, are explained at

length. The placing of staircases and wells is one of the points which most seriously hamper the planner of buildings and most vital to the safety of occupants and the ready action of the fire-brigade in the event of fire. They must be ample in size and number, simple in arrangement, without con- ditioning turns, must have good lighting, must have openings exposed to possible flames from other buildings, or, if this condition be possible of fulfilment, they must be made of fire-resisting frames and similar glass. If they are outside the building they should be so arranged as not to pass windows or other openings from which flame may make its exit; this condition is often violated, the Iroquois Theatre contributing a typical example of the fatal fault. The proximity of lift wells or other vertical shafts must be considered. The details of construction must, of course, vary with the type of the building, though always complying with the general principles of fire-resistance, of which perhaps the most often overlooked is the fact that non-flammability and fire-resistance are by no means synonymous terms. These and similar considerations are discussed in connexion with the building of theatres and schools, residences, factories and garages, safes and vaults.

The last section of the book is devoted to appliances and systems intended to check and extinguish fires. In this we find sprinkler and alarm systems, extinguishers, hydrant pipes, the organisation of private fire-brigades, fire-watches, and drills all very well explained.

The volume is an excellent epitome of the despatch ramifications of its complex subject, and it is impossible in the space available in these columns to do more than indicate some of its contents.

The work should certainly be in the hands of those who are especially interested in fire prevention, and there can be few practising architects whom it would not be helpful.

CORRESPONDENCE.

Education in Architecture.

SIR,—A proposal has been made to my mind by some of the more prominent men in the architectural profession to the effect that the Society of Architects should organise a system of education on similar lines to the

ateliers of the Ecole des Beaux-Arts. In addition it is proposed to institute a method of examination which will tend to eliminate from amongst the students all those who show no real aptitude for the profession and whose energies could therefore be more profitably employed in some other calling.

It is felt that this proposal constitutes a wise development, and one which should prove most popular with all grades of the profession, and my Council are anxious that it should be introduced at the earliest possible moment. They have therefore appointed a Committee to confer on the subject and to consider ways and means. In addition to three of their own members appointed by my Council, the Right Hon. Lord Saye and Sele, Sir George Riddell, Mr. H. V. Lanchester, F.R.I.B.A., and Mr. A. J. Jefferies, F.R.I.B.A., have consented to serve on the Committee referred to, and it is anticipated that other prominent educationalists will also co-operate.

I shall be glad to hear from any other gentlemen, particularly architects, who sympathise with the scheme and who are willing to assist the Society in putting it into operation at an early date.

C. MCARTHUR BUTLER,
Secretary of the Society.

St. Paul's Bridge and the G.P.O. Buildings.

SIR,—The new road proposed by Mr. Arthur Crow in your issue of August 9, and illustrated in your issue of August 16, should certainly commend itself to the authorities and be adopted for carrying out some time in the future.

There are two or three points in connexion with it that I believe were not touched upon. In the first place, the street would pass through the Wood-street "danger zone," and thus by giving better access greatly minimise the risk of serious outbreaks in this part.

Secondly, the amount of time lost through the congestion of heavy traffic in the narrow street must be immense, and such a new street should go a long way towards remedying this.

Thirdly, if trams are taken across St. Paul's Bridge, this street would give a direct connexion between the bridge and the existing tram terminus at Finsbury-pavement.

Fourthly, the new street can be planned axially with the dome of St. Paul's, the grouping of which with the Church of St. Vedast in the foreground would give a picture second only to that which would have been obtained if the new bridge had been planned axially with St. Paul's.

The plan reproduced herewith shows this, and also shows a further extension of this route by a new street connecting Liverpool-street with Whitechapel High-street, at its junction with Commercial-road, thus forming a new through route from the Post Office to the east. About half of this new road is shown along the line of the Metropolitan Railway, which at this part is not covered in and built over. A further length of it is through some very low-class property, and thus the cost of the road should not be excessive. A second and better route is shown on the plan by dotted lines, but this would probably be barred on the ground of cost.

R. DANN.

St. Martin's le Grand.

SIR,—In all that has been written around the demolition of the old General Post Office—the opportunity for a new thoroughfare, the saving of Wren's church in Foster-lane—a noteworthy piece of City architecture has, seemingly, been overlooked which we might reasonably have expected to claim some attention in this matter. The Goldsmiths' Hall has perhaps not been so considered from the fact that it is hidden behind the old Post Office buildings in the characteristic fashion of the City's best buildings, approached by narrow lanes, and defying the modern tendency to isolate any great architectural presence from the intimate setting of its surroundings.

When this area is cleared of the present buildings there will not be a few to whom the revelation of the Goldsmiths' Hall will come as a surprise. That it has escaped notice at the present juncture is proof enough that it still awaits discovery by many. Faithful to Portland stone—stone here almost uniformly bleached throughout the structure in a striking degree—there is hardly a finer building within the precincts of the City: none which so completely expresses the dignity of a great City company and the history of the City itself reflected therein. The scale of the whole building, with its really nobly conceived Corinthian columns and pilasters, evinces a rare sense of architectural form and proportion which is nearer the true Greek feeling than the results achieved by the Renaissance. The Goldsmiths' Hall is a striking contrast to what its architect, Philip Hardwick, R.A., attempted to express, so inappropriately, at Euston, and among all his work it must be considered his masterpiece, well worthy of a little attention just now, when we are hearing so much of the evolution of the classical style. What I wish to suggest, however, is that the building, forming one self-contained block, is one of the determining factors in the re-planning of the old Post Office site and the cutting of any new thoroughfare to relieve the City traffic, as I think will be made very manifest as soon as the existing buildings are demolished.

MAX JUDGE.

INTERCOMMUNICATION COLUMN.

Utilising Roof Tops.

SIR,—A propos your note to the above paragraph (p. 328 ante) anent the "woefully wasted" space beneath high-pitched roofs, can any of your readers advise whether such space can be satisfactorily used as a "fruit room," viz., for the proper storage and preservation of apples and pears, etc., from one's garden? If so, I am sure many would welcome some hints as to the way such space should be ventilated for this purpose.

ENQUIRER.

Stained-Glass Specimens.

SIR,—Will any of your readers kindly inform me where the best specimens of modern stained glass can be seen within, say, 40 miles of London?

MEETINGS.

FRIDAY, OCTOBER 11.

Royal Technical College, *Architectural Craftsmen's Society, Glasgow*.—Mr. A. S. Paterson, M.A., on "Scottish Architecture: XVth to XVIIIth Century."
Institution of Municipal Engineers.—Fourth annual general meeting, London.

SATURDAY, OCTOBER 12.

Aberdeen Architectural Association.—Mr. G. M. Fraser on "The Bridge of Dee." 7.30 p.m.
Institution of Municipal Engineers.—Fourth annual general meeting (concluded).

MONDAY, OCTOBER 14.

The Architectural Association.—Opening meeting of the session. Presidential address by Mr. Gerald C. Horsley. 8 p.m.
Royal Sanitary Institute.—Mr. Alan E. Munby, M.A., A.R.I.B.A., on "Elementary Science: Physics, Chemistry." 7 p.m.
University of London (Victoria and Albert Museum).—Mr. Banister Fletcher on "Constructive Principles of Gothic Architecture." 5 p.m.

TUESDAY, OCTOBER 15.

Royal Sanitary Institute.—Mr. Alan E. Munby, M.A., A.R.I.B.A., on "Elementary Science: Physics, Chemistry." 7 p.m.
Institution of Municipal Engineers (Eastern District).—Meeting at Godmanchester.

WEDNESDAY, OCTOBER 16.

Royal Sanitary Institute.—Mr. Alan E. Munby, M.A., A.R.I.B.A., on "Building Materials." 7 p.m.
The Institution of Heating and Ventilating Engineers (Incorporated).—The autumnal general meeting, University College, Gower-street, London, W.C. The members are invited to attend a lecture to be given by Mr. A. H. Barker, B.A., B.Sc., Wh.Sc., in the Botanical Theatre of the University College, on "The Theory and Limitations of Approximate Calculations in Heating and Ventilation." 5 p.m.

THURSDAY, OCTOBER 17.

University of London (British Museum).—Mr. Banister Fletcher on "The Tomb Palaces of the Egyptians" 4.30 p.m.

COMPETITION NEWS.

A list of current competitions is printed on page 423.

Isolation Hospital, Easington.

The Easington Rural District Council have adopted, by fifteen votes to eight, the design of Mr. Hugh Hedley, of Sunderland, for the proposed new isolation hospital.

Students' Prizes, Society of Architects, 1912-13.

The list of quarterly competitions for students of the Society of Architects has been published. The subject for the Travelling Studentship is "Alms-houses," and the assessor is Mr. E. C. P. Monson, F.R.I.B.A. The date for sending in is May 1, 1913.

Municipal Buildings, Padimah.

Messrs. Pollard & Pollard, of Bank-chambers, Padimah, have been awarded the first premium (40*l.*) in this competition. The second premiated design is by Messrs. Matthew Watson, Landless, & Pierce, 4, Nicholas-street, Burnley. The designs are to be exhibited at the Technical Schools, Padimah, from October 11 to 15.

Library and Museum, Sofia, Bulgaria.

The Commercial Intelligence Branch of the Board of Trade is in receipt of particulars of a competition of designs for a national library and museum, which it is proposed to erect at Sofia at an estimated cost of 2,000,000 fr. (80,000*l.*). Premiums of 4,000 fr. (160*l.*), 2,500 fr. (100*l.*), and 1,000 fr. (40*l.*) are offered. Designs, in sealed envelopes, must reach the "Euphorie"—Frères Evloguie et Christo Guerguieff, Sofia, not later than December 1 next. Full particulars can be obtained from the same address. A copy of the programme (in French), together with blue prints, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

ANCIENT ARCHITECTURE.

MR. BANISTER FLETCHER, F.R.I.B.A., gave the first of a course of twenty-four University Extension Lectures on "Ancient Architecture" in the Assyrian Salon, at the British Museum, on Thursday last week.

He dealt with the nature of the lectures to be given under the auspices of the University of London during the coming winter, saying that

he would trace the evolution of ancient architecture in Egypt, Assyria, Greece, Rome, and Byzantium on broad lines. Architecture, the lecturer explained, was the visible exponent of civilisation, and all present-day buildings were founded upon old art adapted to modern needs. The study of architecture was thus necessary to architects, craftsmen, and art students, and it would be difficult to find anyone to whom a knowledge of the subject would not be useful. The author, journalist, photographer, and antiquary all required a knowledge of the evolution of architecture to help them in their work. The teaching profession now also adds to the interest of history by referring to the dwellings and the temples constructed by the different peoples to suit their social, religious, and political requirements. A knowledge of architectural history also added much to the enjoyment and benefit of travel by enabling people to take an intelligent interest in the monuments of the past. By the study of the most beautiful buildings of bygone ages an improvement in the architecture of our own country would assuredly result.

Mr. Fletcher next gave a short illustrated review of ancient architecture, and referred to the different influences—geographical, geological, climatic, religious, social, political, and historical—which aided in the evolution of typical buildings. He touched lightly on the world-famous Sphinx—a sentinel of the past—the massive temples and tombs of the Egyptians, the palaces of the Assyrians, the temples of the Greeks—*e.g.*, the Parthenon and the Erechtheion—and their open-air theatres, the great buildings of the Romans, including the Baths of Caracalla, the stupendous Colosseum at Rome, the Arches of Triumph, and the dwellings at Pompeii, the churches of the Early Christians, and the peculiar types of buildings erected under the influence of Byzantium. The lectures are to be illustrated by some 1,200 views. This is one of the courses recognised as qualifying for the new diploma in the History of Art just established by the University.

ARCHITECTURAL SOCIETIES.

Glasgow Technical College: Architectural Craftsmen's Society.

The first meeting of the seventeenth session of the Architectural Craftsmen's Society was held in the Royal Technical College, Glasgow. Mr. Alexander H. Purdie, the President, occupied the chair and read a paper on "Comparative Costs of Various Methods of Construction." Alternative methods of constructing walls, floors, roofs, and partitions were discussed, and the paper concluded with a reference to probable costs in connexion with competitive designs.

The Gloucestershire Architectural Association.

Mr. J. A. Gotch, F.S.A., F.R.I.B.A., gave an interesting lecture on Thursday last week at Northgate Mansions to the Gloucestershire Architectural Association upon "The Homes of Queen Elizabeth's Courtiers." The President of the Association (Mr. Walter B. Wood, A.R.I.B.A.) occupied the chair. Mr. Gotch, who illustrated his lecture with a great number of beautiful lantern slides of typical examples, said that under the safe and sound rule of Elizabeth at a time when the dissolution of the monasteries had placed much wealth in certain secular quarters, there was a great zest for building. The ponderous contrivances for ensuring safety gave place before the fulfilment of a desire for better and more comfortable homes. This busy building period lasted for about sixty years, throughout the reigns of Elizabeth and James I. Before it there had been the Tudor period, still distinctly Gothic, and after it came a period distinctly classic. The Elizabethan period had a distinct individuality. The culture of Italy at the time had affected the whole civilised world, and Elizabethan architecture was marked by many Italian features applied very largely to the Gothic forms, which had clung to English builders from their youth; the whole developed with certain distinct characteristics, in accordance with the demands of English climatic and other conditions. From whatever source these characteristics came, they were developed upon a body entirely English, namely, the plan. The buildings had to coincide with the established requirements and customs of English life, and they were built so as to fulfil the great desire for magnificence, for more privacy, and for more light. The great size of the buildings made them so

magnificent that in many cases they were beyond the resources of modern incomes, many descendants of the Elizabethan courtiers had had, perforce, to leave the tremendous homes of their ancestors; privacy was gained by large addition to the number of rooms built into the mansions; and light had been supplied by a larger number of windows more conveniently placed. Indeed, such a change in the latter respect did this Elizabethan architecture bring into vogue that Lord Bacon recorded that "One could not tell where to become out of wind or sunlight." Among the interesting examples of the period which Mr. Gotch showed were several buildings geometrically planned—strictly square, oblong, triangle—after a fanciful manner, which given place in our time to strict utility, hearty vote of thanks was passed to the lecturer on the motion of the President of the Association.

FIFTY YEARS AGO.

From the *Builder* of October 11, 1862.

Electro-Telegraphic Progress.

A NEW discovery has been made. Telegraph without wires can pass through earth and sea, and everyone may establish his own. It is at present a very great secret in scientific circles, adds our authority. It is evident that wonders will never cease. The idea of an electric telegraph without wires, however, though not yet fully realised, far as we know, is not so new as our authors appears to imagine. A Dundee gentleman lately deceased, actually laid (if we may speak) an electric telegraph across Portsmouth harbour, without wires, and worked it too, by permission of the Government. He also telegraphed across the Tay in the same way. Although no wires crossed the river or the harbour, however, a wire was earth plates at right angles was requisited either side.

** The Seventh Wonder of the ancient world was the Pharos, or Watch Tower, completed by Ptolemy Philadelphus, King of Egypt, about 283 B.C. The fires on the early lighthouse, at a height of 550 feet, could be seen by sailors at a distance of 42 miles. This means of communication, namely, the beacon fire, was serviceable until the XIXth century. At Blakeney, in Norfolk, the Church of St. Nicholas possesses a delightful miniature tower which with its lights, used to enable mariners to approach the port in safety by day or night. Later in civilisation came the electric telegraph, and in consequence the disfigurements to the country which have been continual worry to those of æsthetic temperament. The telephone followed, and again complaints sprang up from various quarters where unsightly attributes were placed. Only a few weeks ago the Egham Urban Council had to face protests because it proposed to place telephone poles of historic Runnemede. Will these objectionable accessories to lightning communication eventually disappear? It seems probable, for the greatest wonder of the modern world is rapidly insinuating its invisible witchery into our daily life. We could have foretold that the experiment briefly touched upon in the *Builder* five years ago would have developed into the fantastic yet practical wireless telegraph of the present day? The new era in communication was firmly established when wireless messages were sent in 1901 from Poldio in Cornwall to St. John's, Newfoundland. Since then the efforts of Mr. Marconi have been applied to the perfection of this amazing discovery, and "marconigrams" have taken an increasing share in the history of civilisation and commerce. There is a ground round the earth, and "speeding up" more prevalent than ever. Within twelve months we believe it will be possible to transmit messages direct from the Strand to New York, and those who are alive to do it will smile at the leaden slowness of the present day.—Ed.

MONTHLY REVIEW . of . CONSTRUCTION.

Fig. 1. Cross-Section.

THE NEW WESLEYAN CHURCH HOUSE, WESTMINSTER.

THE new Hall for the Wesleyan community which has been erected on the site of the old Aquarium, in Westminster, on the designs of Messrs. Lanchester & Richards, is without parallel as an example of modern construction in London. Owing to the nature of the planning, which is essentially old in its conception, some extremely interesting problems in construction arose, and these have been scientifically and successfully dealt with by the extensive use of reinforced concrete, which was executed on the Kahn system. To thoroughly appreciate the nature of the construction it is necessary to understand the general arrangement of the building and also its magnitude. The large Conference Hall was obviously the chief factor to be considered in the planning, and this is situated on the first floor and filled with a large dome, as shown on the cross-section, Fig. 1. This apartment measures practically 110 ft. by 80 ft., and galleries are provided on three sides, constructed on the cantilever principle to give the maximum amount of floor space below and to avoid obstructions. A large gallery for the chorus is also provided at the west end of the hall, with provision for a platform in front of same. Other features of interest on this floor are the piers and ante hall, which exhibit much care in planning. There are two other important parts in addition to the first floor, viz., the ground and basement, as distinct from various mezzanine floors which were introduced to

economise space where the heights required for the principal apartments would have been excessive for the smaller rooms. The ground floor contains a great deal of accommodation, including the Library, Small Hall, small Conference Hall, committee-rooms, and a bank, and the disposition of these rooms in relation to each other and the entrances and staircases is carefully studied, as will be observed on reference to the illustration of this plan in Fig. 2. The large tea-room which occurs in the basement is the chief feature of this floor, and the construction of this, described below, is interesting. The total height of the building from the pavement to the springing of the large central dome is about 92 ft., and the basement floor is 16 ft. in height, while the overall dimensions of the site are about 190 ft. by 180 ft. The system of construction employed is not that of a reinforced concrete building throughout, although the greater number of the principal features are constructed on these lines, but rather a combination of steelwork and reinforced concrete with brick arches in certain positions where the architectural treatment rendered this possible. The most important part of the steel construction is provided by the eight large lattice stanchions, described elsewhere, which carry the main dome, these being situated in four pairs at the angles of the square plan from which it springs, and being connected together immediately under the dome by reinforced concrete girders; while large steel girders are also introduced into the construction of the galleries in the main hall. The load on these steel stanchions has been

calculated at about 550 tons each, making a total load on each pair equal to 1,100 tons, and this is carried on a grillage foundation constructed of eight 10-in. by 5-in. rolled steel joists, resting on seven 14-in. by 6-in. joists, each of the latter being about 30 ft. long, and the whole is embedded in cement concrete about 7 ft. thick. The soil consists of a good dry bed of sand and gravel, and the foundations were designed to distribute the loads in such a manner that the pressure did not exceed 2 tons per square foot at any portion. A solid concrete platform is constructed over the whole site, having the under-surface at one uniform level throughout, viz., 7 ft. 6 in. below the basement floor level. The least thickness employed was 1 ft. 3 in., any addition to this being applied upon the upper side, and the effect of this system is to give space at certain points under the basement floor where the concrete is at the minimum thickness, which was utilised for the conveyance of water and drainpipes, ducts, cables, etc. With the exception of the grillage foundations, mentioned above, extra loading or reduced thickness of concrete was compensated for by the introduction of reinforcement in the form of Kahn trussed bars, varying from $\frac{1}{2}$ in. to 1 in. in size. The cross-section previously mentioned (Fig. 1) gives a good idea of the level concrete platform with the space available at certain points. The work in the basement floor is chiefly remarkable for the domed concrete ceilings over the tea-room, and upon studying the details of this work, illustrated in Fig. 4, some idea of its unique character can be gathered. Owing to the large size of this room and the little

*A perspective and plan were published in the Builder, June 24, 1905, and details of the façades, December 28, 1907.

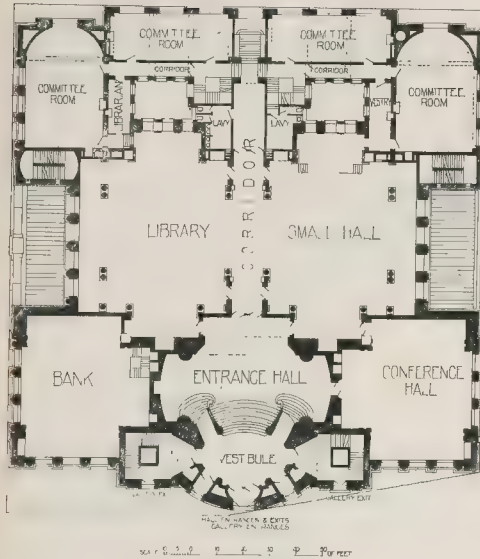

Fig. 2. Ground Floor Plan.

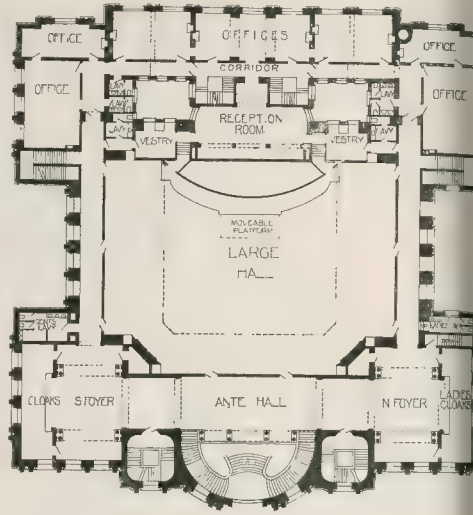

Fig. 3. First Floor Plan.

height that was available, it was quite impossible to obtain a dome with a large rise, and, again, a great deal of the architectural character would have been lost if any other than a flat dome had been employed. These domes are elliptical and cover the central portion of the room, which measures about 42 ft. by 29 ft., with a rise of about 6 ft. only; upon reference to the key plan in Fig. 4 it will be seen that the dome in each instance springs from a rectangular plan, which rendered the work extremely difficult to set out accurately, especially in the case of the pendentives. The total size of the tea-

room is approximately 65 ft. by 170 ft., and the ceiling and floor above are carried by twelve reinforced concrete piers, these latter being connected by curved concrete ribs, each 3 ft. 3 in. wide and reinforced with four 1½-in. Kahn bars at top and bottom. It is doubtful if this work could have been successfully constructed in any material other than reinforced concrete, and is a typical example of the possibilities of this system of construction. The thickness of the concrete forming the domed ceilings was 9 in., and reinforcement was provided in the form of ½-in. Kahn bars, spaced at 12-in. centres. The

horizontal floor above the dome is formed 5 in. of concrete reinforced with ½-in. bars at 12-in. centres, and this is attached to the domed ceiling at the crown of the latter only, thus leaving an open spandril space between the two. The piers carrying this work and the columns over are 4-ft. square constructed of concrete reinforced with eight 1-in. Kahn bars and 1-in. by ½-in. hooping at 3-in. pitch, the vertical bars being extended upward for a short distance into the lower part of the connecting ribs thus forming one complete construction. The ascending to the ground floor the most interesting

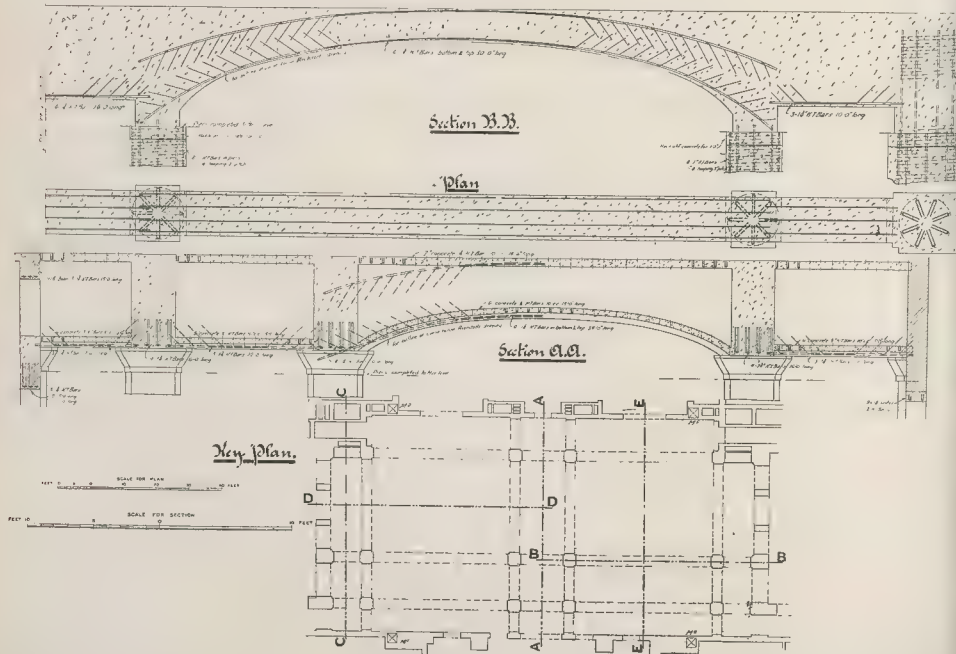

Fig. 4. Details of Ceiling and Floor over Tea-Room.

structural item is provided by the columns of the Small Hall and Library, Fig. 11, which are provided with special regard to the architectural treatment of the rooms in which they are situated. The function they perform is that of supporting the floor of the large Conference Hall above, and have a height of about 28 ft., while the diameter is 2 ft. In forming these columns an attempt was made to avoid the necessity of making a large amount of "making out" by plasterer such as usually occurs in the case of a constructional column which, when completed, forms a decorative feature requiring an entasis, and in consequence the entasis was actually formed in the concrete and a surface was provided on which the plasterer could work direct, using a finishing coat of a uniform thickness. This entasis was so accurately formed that the column in every instance could be completely finished with a coat $\frac{1}{2}$ in. in thickness. The base, cap, and entablature above were also actually formed in concrete, this method saving a great deal of labour when applying the finishings, and making a much more satisfactory job. A very careful setting-out and accurate centering were necessary to obtain the objects aimed at by this method, and especially in the case of the columns, which thus required to be set with a certain portion quite vertical and the remainder having a slight curve corresponding with the required entasis. The boxings were made in separate sections, each being about 4 ft. high, and consisted of narrow strips placed vertically, which could easily be bent to the required curve, and these were fastened to horizontal pieces that were set out, and their outer edges plumb, while the inner edges were formed to a curve coinciding with the diameter of the column at each particular height, these horizontal pieces occurring at intervals of 2 ft. throughout the height. The reinforcement to these columns consists of eight ribbed bars with $\frac{3}{8}$ -in. hoopings at 6-in. centres, the bars being kept back $\frac{1}{2}$ in. from the surface of the concrete.

The work on the first floor is full of interest and account of the large Conference Hall, with its dome, and a few particulars of the dome should prove of value. The galleries are situated on three sides of the hall, and although they are formed in reinforced concrete, large steel plate girders are introduced to aid in carrying the weights. The drawings of the work illustrated in Fig. 5 give a good general idea of the method employed. It will be seen that two steel girders are used, the back girder acting as the anchorage for the sloping portion, which actually carries the ties for the sloping purposes, while the front girder acts as a support, beyond which there is a projection about 14 ft. 6 in. A continuity of reinforcement was preserved as far as possible by carrying the bars from the sloping portion out to the end of the projecting portion, and then turning same back in the horizontal portion until the lower part of the steel girder was encountered. Many of the bars in the sloping portion were also turned back and continued up the slope again in the upper surface. The sloping portion, making an angle of about 32 deg. with the horizontal, is reinforced through in one length of about 38 ft., it has a minimum thickness of 10 in. For

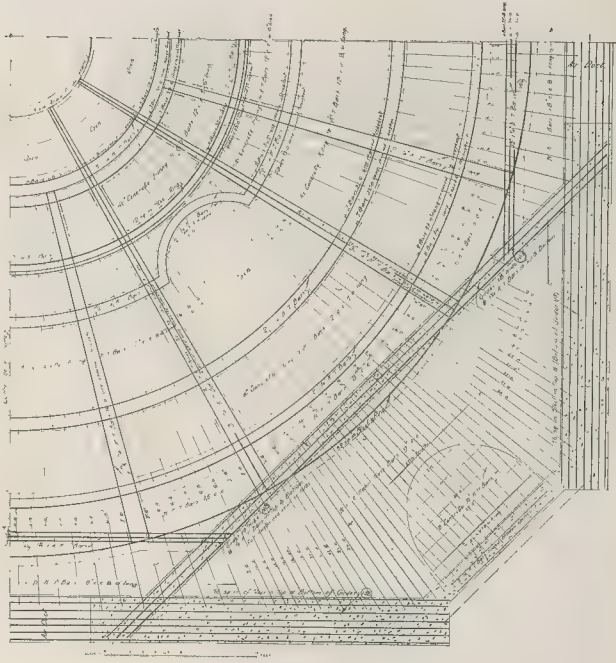

Fig. 6. Part of Plan of Inner Dome.

the sake of lightness hollow tile blocks, 12 in. by 8 in., are introduced, spaced 6 in. apart in the clear, the space between being filled in with concrete reinforced with four 1-in. rib bars, two in the upper and two in the lower surface. These bars were hooped together with $\frac{1}{2}$ -in. wire hoops placed at 12-in. centres, and the tiles were covered with a minimum thickness of 2 in. of concrete.

The horizontal cantilevered portion was reinforced with $\frac{3}{4}$ -in. Kahn trussed bars at 18-in. centres carried out between the rib bars in the slope previously mentioned, and the whole was wired together with $\frac{1}{2}$ -in. by $\frac{1}{2}$ -in. flat hoopings at 6-in. centres.

The floor under the gallery is constructed on the same principle as the sloping portion of the gallery, with 12-in. by 12-in. hollow tile blocks at 18-in. centres, with reinforcement between the blocks consisting of two trussed bars, $1\frac{1}{2}$ in. and $\frac{3}{4}$ in. respectively. A large reinforced beam, 48 in. by 36 in., carries the greater portion of the weight from this floor, the reinforcement consisting of six $1\frac{1}{2}$ -in. trussed bars.

The reinforced concrete dome, which occurs

over the large Conference Hall and has a diameter of 80 ft., is one of the principal features in the building, both from the point of view of design and construction, and the writer is not aware of any reinforced concrete dome in this country of a similar size. This dome, which is coffered and visible from the Hall itself, is covered with an external dome, visible from the exterior of the building, constructed of a light steel framework, it being impossible to get a single dome which would have afforded a satisfactory treatment both internally and externally. The construction of the inner dome is formed by sixteen radiating ribs and five circumferential beams, which project below the filling, and thus form the coffers on the underside, these ribs and beams being well reinforced, as shown on the drawings of this dome, illustrated in Figs. 6 and 7. It will be seen that a circular central opening is formed in the concrete, and this has a 9-in. by 4-in. angle frame. Metal rings are also provided at two other points, one of these being at the springing, and having a sectional area of 32 sq. in., with a diameter of 83 ft., while the other has a diameter of 37 ft. 6 in. and a sectional area of 12 sq. in. The filling between the ribs and beams consists generally of 44-in. concrete reinforced with $\frac{1}{2}$ -in. Kahn bars at 12-in. centres. The pendentives are formed with 8-in. concrete reinforced with $1\frac{1}{2}$ -in. Kahn bars at 9-in. centres. It will be seen, upon reference to the plan, that the octagonal plan is brought over to circular form by large concrete girders 18 in. wide, which carry the ends of the main radial ribs over a span of 50 ft., and these girders have a depth of 8 ft., and are reinforced with eight 14-in. Kahn trussed bars in top and bottom surfaces, and $\frac{3}{4}$ -in. rib bar ties taken right round both sets of reinforcement. The ends of these large girders are in turn carried by still larger girders, which transmit the whole of the loads from the dome construction to the lattice stanchions previously mentioned. These latter girders span a distance of 70 ft., and have a depth of 13 ft. and a width of nearly 4 ft., with no less than 56 sq. in. of steel in both tension and compression areas. Openings are formed on the centre of each girder for the purpose of conveying an air duct through same, these openings being arched at the top. The construction of this dome and the method of transmitting the loads to the foundations is extremely interesting and worthy of particular mention as

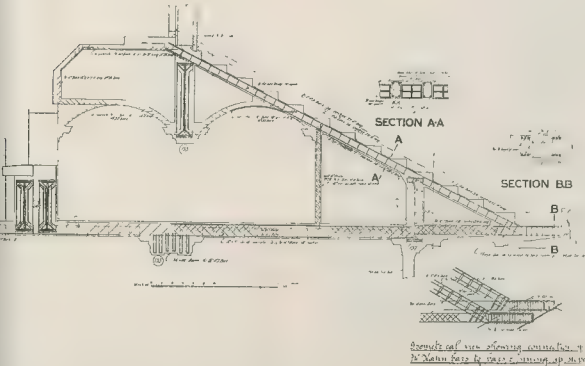

Fig. 5. Section through East Gallery.

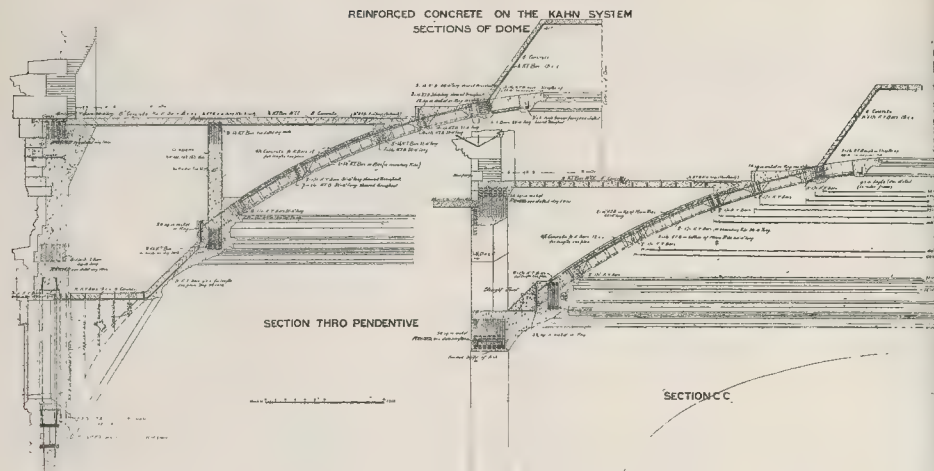

Fig. 7. Sections of Inner Dome.

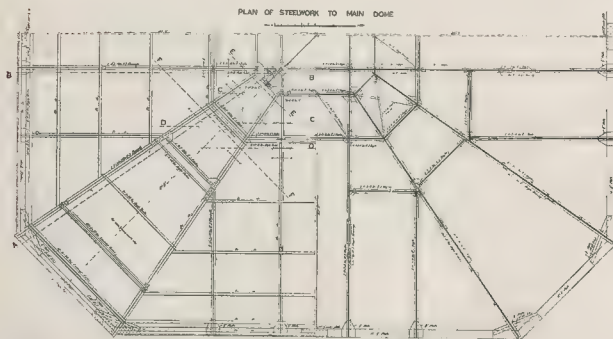

Fig. 8. Plan of Steelwork to Outer Dome.

Fig. 9. Detail of Steelwork to Outer Dome.

an example of modern work, which shows the possibilities of reinforced concrete as a structural material.

The steelwork carrying the outer dome, illustrated in Figs. 8 and 9, this consisting of eight principals, which were placed at 45° angles and connected at the foot by a steel plate, 14 in. by 3/4 in., well tied at the lap sections. The principals consisted generally of two 6-in. by 3-in. by 14-lb. rolled steel channels which acted as the principal rafter, well braced with 3-in. by 3-in. angles, and with two 4-in. by 3-in. angles to form a tie. Six angle purlls were introduced to carry the woodwork, and the principals were also braced together to stiffen them laterally, and tied at the foot with rods. Each truss had to span practically a distance of over 43 ft., and had a rise of 48 ft. The steel lattice stanchions, which were previously mentioned as carrying the load from the dome, are illustrated in Fig. 10, and it will be seen that these have a total height of 82 ft. 9 in. the upper part of which, however, for a distance of 22 ft. 7 in. is constructed as a compound steel stanchion, with a section composed of two 18-in. by 7-in. by 75-lb. R.S.J.'s, and four 18-in. by 3/4-in. plates. The lower lattice portion was built up with four 10-in. by 8-in. by 70-lb. R.S.J.'s, and four 10-in. by 3/4-in. by 28-lb. Zed steels, braced by horizontal angles 3/4 in. by 3/4 in. by 3 in. at 3 ft. 6 in. distances, and similar angles placed diagonally between the stanchions, acting as illustrated. The two stanchions, acting as a pair, were also braced together by a truss 11 ft. deep at the top of the lattice portion, and another truss of similar type at the head of the compound portion. The base plates to the stanchions were 6 ft. square and carried grillage foundations, as previously described.

The exterior treatment of the building, striking on account of the bold detail and excellent grouping of the several parts, and although a great deal of ornament is applied, the general effect is one of repose and grandeur. The omission of the two towers on either side of the principal entrance detracts greatly from the possible effect of the composition as a whole, but, despite this fact, there is a sense of magnificence about the building which is produced by the maintenance of good proportions and outline, culminating in the splendid dome which is undoubtedly the feature of the design. The whole of the façades are in Portland stone, and the style adopted is somewhat free in treatment, the main window openings having semi-circular heads and being separated by columns with composite caps treated in an original manner, while large *modifs* occur over the windows, each appropriately carved with emblematical ornament. The frieze is cut up by window openings, and carved brackets occur over the columns and support the large cornice forming the crowning member of the Order. The treatment of the dome is full of interest, and it is a splendid example of leadwork, the whole dome being covered with this material. The plan of the dome is practically a square.

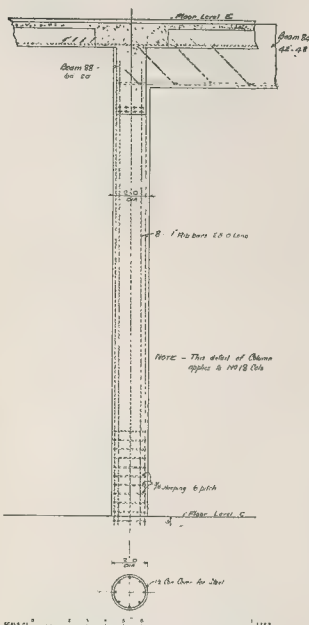

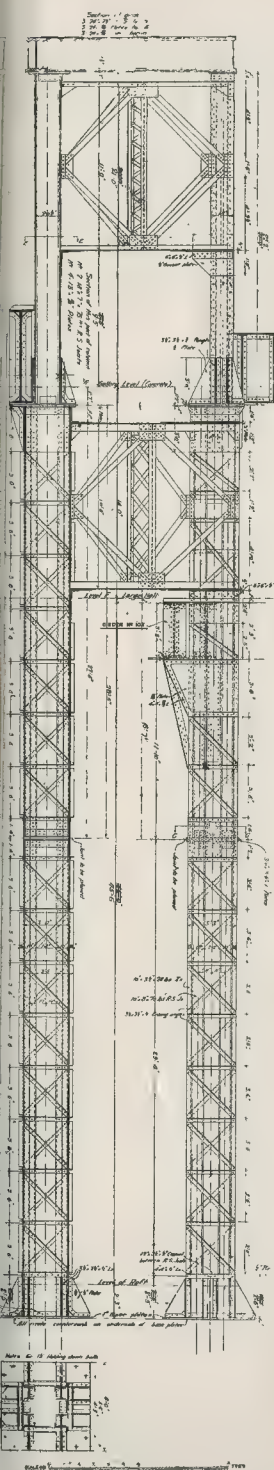

Fig. 11. Detail of Reinforced Concrete Columns supporting Main Hall.

with the corners cut off, giving four large faces and four small surfaces, and at the bases of the latter are ornamental lead trophies, 24 ft. 6 in. by 13 ft. 6 in., these being modelled by Mr. H. Poole and cast by Messrs. J. W. Singer & Sons, of Frome. At the gallery level and on the lantern are four lead vases, and the dome is

further enriched with a frieze of leaf-work and swags consisting of flowers and shells, executed by the above firm and modelled by Mr. Henry C. Fehr from the architects' designs. The top of the lantern is surmounted by a copper gilt finial, which, although not symbolical, has aroused some interest and discussion since being placed in position. The general treatment and effect of this dome can be seen in the illustration of this portion of the work, which is a reproduction of the architects' original drawing. The interior treatment cannot be classified as any distinct style—although exhibiting traces of French influence—it being obviously the creation of the designers without any attempt at a slavish copy of any particular period of architecture. The treatment of the Large Hall is somewhat simple in character, there being no columns, as the galleries are constructed on the cantilever principle to prevent obstruction in the body of the hall. A very fine organ is situated at the west end of the hall, and this forms quite a feature with a well-designed case of oak. This latter material is employed for all the woodwork, including the seats; and the doors leading to the galleries are treated with overdoors somewhat ornate in character, having curved pediments terminating with scrolls and vases containing flowers, which are excellently carved. The domed ceiling is enriched with coffers, and has a central feature of plaster ornament masking a ventilation opening. Four large electroliers are suspended from the dome, and these are of bronze with the lights placed within moulded glass, each electrolier containing twenty-four lights, twelve of which are placed inside the main body of the pendant and the remainder in groups of three suspended around same. These fittings, together with the wall brackets, were carried out to the designs of the architects, and must be considered as very successful.

Some excellent work is to be seen on the entrance hall and grand staircase, both as regards design and execution, the material employed for practically the whole of this portion of the building internally being Roman marble of a soft grey colour, which is a natural hard limestone capable of taking a fine gloss polish. The staircase itself is a wonderful piece of work, having flowing strings and being very bold in treatment, with wide flights and continuous ramps running up to a height of forty steps, while the newel abutments to these strings each weigh about one ton and a half.

Fig. 12. View showing Construction of Outer Dome.

The balustrade is of iron with bronze enrichments, and in connexion with this are four standards in iron and bronze, surmounted by octagonal bronze lanterns, the whole being of masterly design. The main entrance vestibule is elliptical on plan, and has the marble work carried up to the ceiling level, the walls being penetrated by a series of eight arches. The geometrical paving is also carried out in Roman marble, and similar material is used for the marble dado in the upper entrance hall, the lamp standards, and the door architraves, the latter being finished with a frieze and cornice at the head, where an example of the adaptability of the material for carved work can be seen. The whole of this work was carried out by Messrs. J. Whitehead & Sons, of Kennington Oval, who also supplied the monoliths and piers in the upper entrance hall, which were executed in "Arni Fantastique" marble.

The Library and Small Hall are very successfully treated with enriched and panelled ceilings, and columns with moulded caps and fluted neckings, all simple in character but dignified and effective, while the tea-rooms are also simple in treatment, relying greatly on the flat-domed ceilings mentioned in the constructional notes.

The heating and ventilation scheme, which was carried out by Messrs. Ashwell & Nesbit, has been carefully considered in all its details, economy and efficiency being the primary objects. The Large and Small Halls are dealt with on the Plenum system, while the smaller rooms are dealt with by means of ventilating radiators, with the vitiated air extracted by centrifugal fans. The supply of air to the Large Hall is sufficient to give 1,000 cubic ft. per hour per head to 2,700 occupants, and this is supplied by means of a large centrifugal fan, fixed in the roof space, which draws it directly from the outside and causes it to be passed over a filter screen to cleanse and purify it before it is passed into the building. After leaving the fan this air is passed over heating batteries, so that it can be raised to any desired temperature. The whole of the radiators to the small rooms, and also the heating batteries in connexion with the Plenum system, are worked on the Novacumette system, the heating medium being steam or vapour below atmospheric pressure, which enables the heating surfaces to be kept at a low temperature, and thus avoiding any unpleasant scorching of the air. The temperature of the Large and Small Halls and upper rooms is automatically controlled by means of thermostats, which shut off the heat in the radiators or batteries when the predetermined temperature is reached. An excellent system of hydrants is provided for fire purposes, and the sewage is dealt with by Shone's pneumatic ejectors.

This building must be considered as excellently equipped in every way, and architecturally it must rank with the finest buildings erected in this country of recent years, showing a bold and masterly treatment wherein the designers have realised an ideal based upon perfect proportion, which is the essence of true architecture. The general contractors for the work were Messrs. Dove Brothers, of Islington. The Portland stone used in the building came from the old-established quarries of Mr. F. J. Baines, Portland, Dorset.

The fireplaces were supplied by Messrs. Bratt, Colbran, & Co., Mortimer-street, W.

Other firms who have carried out work are Messrs. Archibald D. Dawney & Sons, Ltd., steel and iron construction; Messrs. Strode & Co., lighting; Messrs. H. H. Martyn & Co., plastering and ornamental work; and the Associated Portland Cement Manufacturing Company, who supplied cement, etc.

FACTORY BUILDING VENTILATION.

THE building recently completed for the Bosch Magneto Company at Springfield, Massachusetts, is 315 ft. long by 66 ft. wide by four stories high, being cruciform in plan, with a main stairway at the centre and similar stairways at either end of the main portion. The staircase wells have been utilised as ventilation ducts, through which air is passed by exhaust and blowing fans.

Over the main stairway there are two fans with the combined capacity of 200,000 cubic ft. per minute, and blowing fans of 30,000 cubic ft. per minute are provided for the ducts at the ends of the building.

Air is admitted into the ducts from the

corridors extending along the centre line of the building, and communicating with the workrooms on either side by means of louvres, which permit the direction and volume of the air passing through the rooms to be regulated as necessary.

In cold weather the fans over the main stairway change the air in the workrooms only twice an hour, fresh air being drawn in partly through the walls and gaps in the windows, and partly through galvanised-iron pipes along the ceilings, and passing through the outer walls. The pipes are of 6-in. diameter and suitably perforated for the supply of fresh air, which mixes with the warm air of the room as it gravitates downward.

Exhaust air is drawn away by the louvres fixed near the bottom of the partitions on either side of the corridors, and passing along the latter enters the main stairway ventilation duct, whence it is discharged into open air.

In warmer weather, when the windows of the workrooms can be opened, the air is changed more frequently, up to twelve times an hour, if thought desirable. As all the windows are opened mechanically in groups, and the gear cannot be interfered with by the workpeople, the regular operation of the ventilation system can be readily ensured.

In very warm weather the exhaust fans are run in the early morning so as to draw the cool night air through the building and reduce the temperature of the interior. During the daytime all windows are closed, and fresh air is blown in by the fans at rough cooling apparatus after having passed through the end of the building, of the waterspray type. Water for this plant is drawn from wells at the rate of about 60 gallons per minute for each apparatus, its average temperature being about 54 deg. Fahr.

The forge and hardening-rooms and some of the toilet-rooms are ventilated independently by means of the fans at the ends of the main building, with the object of keeping fumes and gases away from the ordinary workrooms.

THE INTERNATIONAL CONGRESS FOR TESTING MATERIALS OF CONSTRUCTION.

SOME idea of the importance attaching to the recent Congress of the International Association for Testing Materials may be gathered from the fact that nearly 200 papers and reports were submitted for consideration, and will be issued in five volumes, forming part of the second volume of the *Proceedings*.

The business of the Congress was opened by the Presidential Address of Dr. Henry M. Howe, and the professional work of the gathering was carried on by three sections, by which eighteen meetings were held.

Section A was devoted to metals; Section B to cement, stone, and concrete; and Section C to timber, bitumen, rubber, and other materials.

In view of the enormous number of papers presented and of the fact that many of the subjects discussed are quite beyond the scope of this journal, we mention in the subjoined notes only a few of the communications appealing more or less directly to our readers.

Section A.—A paper by Mr. H. Baucke on "The Action of Electrolytes on Metals under Stress" supports the theory that metals under stress are in a metastable state, which may pass into the stable state under the action of an electrolyte. The paper by Mr. F. N. Speller on "Comparative Service Obtained with Wrought-Iron and Soft Steel Pipes as Water Lines" contains a large amount of data collected in the United States on the corrosion of pipes, the tendency of the data being somewhat against the opinion generally entertained in favour of the first-mentioned metal. Among other papers discussed in the same section were "Testing Methods for Rivet Steels, Steel Wire, and Welded Metal," by M. Charles Frémont; "Tests for the Elongation and Ductility under the Drop-Testing Machine," by Dr. P. H. Dudley; and many others dealing with the properties and testing of metals.

Section B. In this section the Committee on the Durability of Building Stones recommended that laboratories should be asked to adopt the Hirschwald method of classifying stone in respect of durability against weathering. Mr. P. H. Bates reported that the United States Bureau of Standards had made an exhaustive investigation of building failures alleged to be due to electrolysis in concrete, and

had only been able to trace one such failure to the cause mentioned. In a paper entitled "Progressive Increase in Strength of Cement Mortars" M. E. Candiot recommended the omission of all requirements for increase of strength between seven and twenty-eight days, a recommendation supported by Mr. Ber. Blount, Dr. Dyckerhoff, Dr. F. Schott, W. C. Hanna, and others. The paper of M. A. Poulsen on "Diatom Earth as a Pozzolanic Admixture for Cement" elicited the general opinion from members present that the increased strength of such mixtures was due mainly to the extremely fine grinding and thorough mixing of the product, and Mr. E. L. Humphrey stated the view that mixing fine sand or clay with cement would be as efficacious as diatom earth. Four papers were presented on the Le Chatelier test for the constancy of volume of cements, the authors being Messrs. Bertram Blount, M. Gary, F. Schule, and J. Bied. This subject is one of somewhat controversial character, the test in question being strongly opposed by leading German authorities. It was finally decided that the task of further examining all methods of accelerated tests for the constancy of volume of Portland cements should be referred to a Committee of the Association.

Section C.—In papers on "The Volume Change in the Testing of Paint Materials," by Mr. G. W. Thompson, and the "Bitumen Content of Coarse Bituminous Aggregates," by Mr. Prevost Hubbard, attention was drawn to the fact that a statement of the proportions and percentages of the total weight may be very misleading in cases where the materials are of different specific gravities. A valuable communication by Professor Ira H. Woolson and Mr. Rudolph P. Miller contained elaborate data concerning fire tests of floors in the United States. In all, eighty-two tests were reported, and from them the following conclusions were drawn:—Terra-cotta and concrete floors can be made perfectly safe against fire; reinforcement should have 1 in. protection in slabs, 1½ in. in beams, and 2 in. in girders; structural steel beams should have 1½ in. to 2 in. protection; rock makes the best aggregate for both strength and fire resistance, but 1:2:5 cinder concrete has a high resistance to fire; its porosity being a serious defect for some uses. Tests for oil were discussed in several papers, one of the most important being by M. Emil Constantino of the Belgian State Railways. The question of testing materials for road construction was brought forward by M. A. Messager, of the Public Works Department, Paris. It is satisfactory to note that this subject will be taken up by a Committee working in collaboration with the executive of the International Road Congress.

SAFETY LOCKS FOR AUTOMATIC LIFTS.

SERIOUS accidents have happened through leaving open, or through opening at improper times, the gates giving access to the wells of automatic lifts.

Messrs. Smith, Major, & Stevens, Ltd., have devoted considerable attention to the problem of devising a lock which will prevent the opening of such gates except when the lift-cage is at the proper level relatively to the gate opened.

The lock which has been evolved by them as the result of their study differs radically in its mode of action from all other locks for lift gates. Its predecessors are actuated entirely by the closing of the door or gate; their lock is operated independently of this.

Three things have to be done, viz., shut the door or gate, latch it, give current to the machine. The faults of the old systems arise from a futile attempt to make these three things occur simultaneously, an almost impossible combination. To secure a safe result, the three things must be done in proper sequence, and with the fitting under consideration the order is as follows. Firstly, the door or gate must be completely closed; until that is done nothing more can be effected. Secondly, the gate is latched; until that is securely done it is impossible to give current to the machine. Thirdly, the current is given. On opening the gate the reverse order is equally definite; first the current must be cut off, and only then can the gate be unlatched and finally opened.

The mechanical means by which the above described results are attained are as below described. The switch is contained in a cast-

fixed on the gate or door frame at the of an ordinary door-lock. A spring latch finger rigidly connected to it are attached to the gate or door. Fixed to the cage is an striking plane. Projecting from the box, in such a position that the striking-plane operate it, is the interlocking lever. The cage to be at the floor level and the door open, in which position the lift is in control of that floor, and the cage cannot be moved by a person on any other landing. When the passenger user enters the cage, closes the door and latches it. After the latch has protruded the finger attached to it operates the circuit and closes the circuit, enabling the cage to be moved. The passenger now presses the button, and the cage moves away from the floor, of course carrying with it the striking plane which has been keeping the interlocking out of engagement. When the cage has moved about 18 in. from the floor level this is free to engage with the brush carrier, which is so enclosed that even if it break, the cage cannot escape, and the spring is successful, though broken. The lever holds the latch and switch in the closed position until the cage returns to the floor, when the foregoing operations are performed in the reverse order, i.e., the plane disengages the locking lever, the cage is within 18 in. of the floor level, the passenger is then able to move the gate, which first opens the circuit and then releases the gate, permitting it to be opened. As stated above, immediately the lock circuit is broken it becomes impossible to control the cage on any floor other than that at which the door opens. This safeguard makes entrance to, or loading of, the cage, a perfectly safe proceeding, and at the same time makes it impossible to inadvertently open a gate or door into the lift well, except when the cage is in position to it.

CONSTRUCTION NOTES.

The following is an epitome of the results of an investigation made at the University of Nebraska, as set forth by Mr. George E. Borrowsman, into the causes of disintegration as it occurs in concrete having a cinder aggregate. The investigation suggested the probability of oxidation of iron and sulphur produced stress and consequent cracking, aided, it is believed, by the general weakness produced by diffusion of soluble sulphates. This view is confirmed by finding that the efflorescence, on the surface of the disintegrating concrete, contained ferrous sulphate. These were then attempted to be brought out by substituting, for cinders, artificial iron cinders, prepared in several ways, but the results did not behave similarly. On breaking the blocks, the sulphide was found unchanged, surrounded by hard, compact concrete. Soluble sulphates being absent in the initial mixtures, the blocks had, of course, no initial strength than those containing iron sulphate, and would have withstood considerable stress had there been any applied. The lack of oxygen, in these tests, indicated that, in the case of the cinders, the necessary oxygen must come from the cinders themselves, since the concrete was equally placed in relation to atmospheric air.

This observation drew further attention to the composition of the cinders used when it was found that about one-third of it was a very soft coke. As is well known, coke, as other carbon, will persistently seclude large amounts of oxygen gas.

According to the experiments of Messrs. Lewis & Lewis, air-dried coke contains absorbed water to the extent of 0.7 cubic centimetre of water of coke, 2 to 6 per cent. of the gases evolved on oxidation observed in the Nebraska tests most pronounced where the coke was present in concrete. Some pieces of coke picked from the stock of cinder, when analysed, showed 1 per cent. of sulphur, in the form of sulphide; that is capable of undergoing oxidation.

Further experiments, some of the original cinders was exposed for a period to air moisture, until, on washing, it showed the presence of no soluble sulphate. A specimen was then made into a block of concrete similar to those prepared before, 1:1:1.

when under parallel conditions no disturbance took place, the material remaining firm and compact.

From these tests the opinion is expressed that cinders with much sulphide and sulphate in them are likely to give unsatisfactory results, and especially so if there be much coke or porous air absorbent material present. Such material may be improved by methods that bring about the removal of the injurious components, and in this direction are to be mentioned weathering, with occasional washing until the ferrous compounds and sulphur have been oxidised to their full extent, and subsequently washed out.

Leith Dock Extension.

The Works Committee of the Leith Dock Commission have approved of a scheme for dock extension at Leith and Newhaven, the estimated cost of which is about 250,000. It is proposed to carry the work out gradually, and the completion of the scheme might occupy from twelve to fifteen years. It is recommended that Parliamentary powers should be sought to enclose the area between Newhaven and the West Pier, Leith, to provide additional facilities for the shipping trade. Power would also be required to extend the Imperial Dock and to build an embankment extending eastwards from the dock. By a sea embankment between Newhaven and Leith an area of about 120 acres would be enclosed.

Glazing Tests.

The British Fire Prevention Committee has issued a further report on its series of glazing tests; this time in respect of three windows glazed with "Chadrac" electro-glazing and submitted for review by Messrs. Chater & Sons, London. A feature of the report is that whilst up to the present the limit of fire-resisting glazing has been on a panel measuring 2 ft. by 2 ft., the panel here under review is just double the size—i.e., 4 ft. by 2 ft., and this is certainly an interesting achievement for glazing under fire tests for one hour at temperatures ranging up to 1,600 deg. Fahr., followed by the application of water from a steam fire-engine at short range.

Buildings Suitable for Grinding Mills.

TWO EXPLOSIONS in November, 1911, one in Glasgow and another in Liverpool, attended with loss of life and destruction of buildings, have been reported upon by H.M. Inspectors of Factories. In the first case the millstones employed were grinding peas, beans, and wheat, and the explosion was believed to be started by a fall of dust composed of those foods from the overhead beams of the room on to a portable Bunsen burner. The dust found on some of the beams was very fine, resembling pale-brown flour, and it lay there to a thickness of 2 in. to 5 in. When tested it was found to be more readily ignited in an explosion tube than coal dust; firing at 1,050 deg. C., and the flame travelling through the whole of the tube as a bright flash.

These deposits of dust were probably disturbed by the initial explosion, and served to propagate the explosion wave throughout the entire building. In this case, as in the second one, it is recommended that naked lights be not used, in such rooms, that smoking and the carrying of matches by the workmen be prohibited, and that there be frequent cleaning of floors, beams, rafters, etc., the dust as far as practicable being removed by vacuum appliances.

In the second case, where thirty-nine persons were killed and 101 injured, the explosion originated in the basement where disintegrators for oil cake, beans, and other materials were at work. The incident which started the explosion is considered to have been the breaking of the driving belt of one of the machines—a belt 6 in. wide, running at 5,000 lineal ft. per minute.

An examination of the dust produced and scattered about by the disintegrators and the attendant elevators showed it to contain 9.63 per cent. of moisture, 6 per cent. of ash, and the remainder combustible material. This fine dust, if present in the air in small quantities, was not explosive, but if forming a dense cloud it would explode in the presence of a lighted match, an ordinary gas jet, the electric flash at the fusing of an electric-fuse wire, and the

spark produced by breaking the circuit of an electro-magnet.

The probable origin of the explosion in question was either of the two latter causes, viz., a spark or flash of light.

Where carbonaceous dust is generated, or present in dangerous quantities the rooms should not have others over them, nor should they adjoin higher buildings which might be affected by any explosion and the roof should offer little resistance to a force from within. There should be no ledges or other places where dust could lodge therein, and the grinding and elevating machinery should be dust-proof. As an aid towards avoidance of sparks, there should be provided on the entry to each disintegrator an electro-magnetic separator to abstract any particles of iron or steel that might perchance be mixed with the foodstuffs, and if allowed to gain access might cause trouble.

A Point in Reinforced Concrete Design.

In a note contributed to a French contemporary M. Koechlin draws attention to an important point which does not always receive attention by designers of reinforced concrete structures, and which if neglected may result in considerable diminution of effective resistance.

Referring to bends in round bars used as tension reinforcement, the writer points out that the change of direction of the force at the bend develops compression in the concrete, the intensity of the stress being inversely proportional to the radius of curvature of the bend.

Denoting by R the radius of curvature; d , the diameter of the bar; t , the tensile stress in the steel; and c , the compressive stress in the concrete, we have:—

$$c = \frac{R - r}{R} t \quad (1)$$

Taking into account a given limit of permissible stress in the concrete, the minimum radius of curvature for the bend of a bar will be:—

$$R = \frac{R - r}{c} t \quad (2)$$

Assuming the limiting stress, c , to be 700 lb. per square inch, the radius of curvature, R , for a bar of given diameter will vary with the tensile stress, t , developed in the steel, as shown by the subjoined table, which we have calculated by formula (2):—

MAXIMUM RADIUS OF CURVATURE FOR BENDS.

Diameter of Bar.	Tensile Stress in Steel (pounds per square inch).				
	10,000	12,000	14,000	16,000	18,000
In.	In.	In.	In.	In.	In.
2	2.8	3.4	3.9	4.5	5.0
3	3.6	4.3	4.9	5.6	6.2
4	4.4	5.3	6.0	6.8	7.5
5	5.2	6.2	7.0	7.9	8.8
6	6.0	7.2	8.1	9.1	10.0
7	6.8	8.1	9.2	10.3	11.4
8	7.6	9.0	10.2	11.4	12.6
9	8.4	9.9	11.2	12.5	13.8
10	9.2	10.8	12.1	13.6	15.0

The Preservation of Wood with Fluorides.

HERR R. NOWOTNY describes in the Austrian *Chem. Zeit.* of 1912 how that for the purpose of increasing the preservative effect of sodium fluoride on wood it is now being mixed with nitrophenols. One of these mixtures, known as "Bellit," contains 90 per cent. by weight of a sodium fluoride and 10 per cent. of dinitrophenol, the sodium fluoride being of 90 to 95 per cent. strength or purity. This mixture is used because, whilst active as an antiseptic, it does not, like free dinitrophenol, act upon the iron vessels in which the timber is impregnated. The selective phenomena observed when treating timber with mixtures of zinc fluoride and hydrochloric acid are reproduced in the "Bellit" treatment just mentioned.

Impregnation by steeping results in the solution being absorbed as a whole, but in the hydrostatic and pneumatic pressure methods the nitro-compound is absorbed more rapidly than the fluoride of sodium. Examination of telegraph poles which had been treated six to seven years previously, i.e., in the year 1905 and 1906, with copper sulphate and zinc fluoride respectively showed that, in general, the latter was much the better preservative.

THE BUILDING TRADE.

INLAND REVENUE REPORT: THE LAND TAXES.

THE fifty-fifth Report of the Commissioners of Inland Revenue has recently been issued, and those interested in land will turn to those pages which give official information up to March 31, 1912, as to the revenue from the new land taxes. It will be remembered that up to March 31, 1911, in Great Britain 10,700,000 forms had been issued and 9,600,000 returns received back. On March 31 last the position was much the same, 10,874,568 forms having been issued and 10,097,769 returns received. In consequence of the decision in *Dyson v. Attorney General* (see the *Builder*, December 1, 1911) the Report states that revised forms were issued where no returns had been received omitting the requisition held *ultra vires* requiring occupying owners to state the annual value of the land.

The number of valuations to be made as at April 30, 1909, was approximately estimated as 11 millions. On March 31, 1911, provisional valuations had been made numbering 298,204. Up to March 31 last the number of provisional valuations made was 1,799,468; thus in the year about 1½ million provisional valuations have been made. Presumably the system is in full working order, and therefore an estimate may be made of the time required to complete the original valuation as on April 30, 1909. The rate of progress would appear to show that the valuation will occupy between seven and eight years, and that in 1917-18 we may still have valuers determining the values of properties in April, 1909.

If it be urged that practice may result in greater efficiency and greater celerity it must also be recollected that as each year passes the staff will be more occupied as "occasions" arise which necessitate revaluation. In the year 1911 67,238 such "occasions" arose, but in the year 1912 they numbered 205,112; thus the time is more likely to be prolonged than lessened unless the staff is continually increased.

Interest will chiefly centre in the results attained by this herculean labour, and here the *ridiculus mus* creeps in, for increment value duty from the commencement of the operation of the Act has yielded the grand total of 6,220L.; reversion duty, 22,755L.; and undeveloped land duty, 31,298L.; total, 60,273L. These figures, of course, take no account of the cost of valuation and collection; but, turning to the Commissioners' Report for last year, it is interesting to note that the cost to the State for the services of the land valuation officers—that is to say, of those persons engaged temporarily to issue forms, etc., and whose services terminated at the close of last year, and were not connected with the actual valuation—amounted to 174,342L. Thus the yield from the land taxes up to March 31 last had paid about one-third of the salaries of those temporarily employed in preliminary arrangements.

When these figures are made the subject of public discussion the direct issue of whether the new land taxes are revenue yielding taxes is always evaded by advocates of the system by a reference to an increase in the estate duties. In this connexion it is interesting to note that in this latest Report of the Commissioners a table, No. 165, is included that we are unable to find in its predecessor. A good deal is likely to be heard of this table. It shows the amount of estates brought in by accounting parties for estate, etc., duty, and the amount by which it was increased by the valuation department. In the year ending March 31, 1911, the "increase due to official valuation" is stated to be 3,282,983L., or 744 per cent.; and in the year ending March 31, 1912, 3,900,137L., or 559 per cent. for the whole period, 7,183,120L., or 631.

In the absence of tables for former periods it is impossible to say how this increase is arrived at. There may always have been an increase on the amounts so brought in, but, however this may be, a reference to Mr. Lloyd George's Budget speeches will show that this aspect of the question was not before his mind when he introduced his celebrated Budget; he

looked upon the new taxes as substantial sources of revenue, and although he said the full benefit of increment value duty would not be experienced at once, he gave substantial estimates of the revenue which they would raise, and would have scoffed at any opponent who dared to suggest that the total yield of the three new taxes up to March 31, 1912, would be but 60,273L., as the event has proved. If the amount upon which the estate duty is assessed has been increased, this is not part of the Budget scheme, but, to use the Chancellor's own expression, is "a windfall, an unearned increment," unforeseen, which has resulted to the Government from the Act. A very ardent follower of the Government, but an astute critic, Mr. Morgan has, in his recent book, "The Blight on the Countryside," pointed out that if this increase is due to the new system of valuation it is surprising that the universal complaint should be that properties are undervalued in order that the increment may accrue. Other causes have no doubt contributed to the increase, but, in any case, it has to be remembered that this increase is not revenue itself, but a capital sum upon which estate duty varying in amount is assessed. The total yield of the estate, etc., duty assessed on really appears to be 3,013,197L., so an increase of 5.59 per cent. in the year on the sum on which it was assessed does not, after all, represent a very large increased revenue.

Against any revenue derived from the system has to be taken into consideration not only the cost of valuation, but the serious disturbance to dealings in land and its depreciation in the market as distinguished from mere valuations.

It only remains to be noticed that amongst the judicial decisions on the duties on land values contained in this Report the Scotch decision negating the possibility of increment occurring on minus values (see the *Builder*, April 26, 1912) finds no place. This decision is on appeal, and this Report contains no reference to the subject, but in the fifty-fourth Report this question was thus dealt with:—"It is to be observed that in the case of a property burdened by a heavy rent charge the assessable site value may be nil or even a minus quantity. This means that the charge is so heavy that no one would take over the bare site thus burdened unless he were paid to do so. This is especially the case in Scotland owing to the operation of the feuing system. The liability to increment value duty will not be affected, any increase of value being reckoned as readily from a negative as from a positive quantity." The italics are ours. Presumably this view is still being acted upon.

GLASGOW BUILDING TRADE.

The annual statement was made recently by the Lord Dean of Guild, Mr. Francis Henderson, at the usual meeting of the Dean of Guild Court. Mr. Henderson said that, they all knew, the general trade of the country had recently been experiencing better times. But the wave of prosperity had not yet reached those trades with the work of which a Dean of Guild Court was most intimately concerned. The building trades of the City of Glasgow were still far from an enviable position which they occupied some years ago. That might be due to many things. It might be that in those years there was to some extent over-building. But ordinary conditions had prevailed they would have heard less of the cry of over-building. The loss to the city by emigration and overflow into suburban areas was rather to be forgotten by unsympathetic critics of builders. The building trades during the year had had nothing to boast of, which doubt was to some extent owing to the fact that there are still within the old city boundaries 18,620 unoccupied houses and 44,000 unoccupied shops, etc. The returns for houses, generally, for warehouses, shops, and offices for churches and halls, for schools, and for public buildings, all showed marked decrease in value. There had been a very great attrition to his mind, satisfactory decrease in the number of houses consisting of one apartment. The returns for houses of three or four apartments and for single shops and workshops, etc., showed slight increases. In the past year was seen at its best in the returns for alterations and additions. Though the number of cases for these was much the same as in the previous year, the value of the work involved had risen from 105,880 to 169,213L.

The figures given as to the average number of persons per room was still higher than what one would like to see, but in comparison with the figures of twenty and thirty years ago they showed a very marked improvement. Apart from that, sanitary and other conveniences had made great strides. The percentage of unlet rental was on the increase. In 1902 it was only 2.29 of the total, and in 1907 it had risen to 5.35, and this year had reached the high figure of 6.34.

A NEW ALLOY.

An interesting exhibit at Olympia is shown at the stands Nos. 157 and 170 of the Melbargo Syndicate, Ltd., sole agents for the metal alloy, Ormolium. This metal has a new coloured alloy, it is quite distinctive from brass, copper, bronze, or any deposits, and has the same colour throughout.

Messrs. Wakelin & Dent, who are the sole agents to the Syndicate, have made special

The Turnpike in Tottenham Court-road, c. 1800, after Rowlandson.

Norwood.—Formation or laying-out of a new street for carriage traffic to lead from Brixton-hill to Acre-lane, Brixton (Messrs. E. Evans & Co.).—Consent.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

BARRY.—Additions to hospital (3504).; Mr. J. C. Pardoe, Surveyor, Council Offices, Barry.

Bedford.—Factory and schools; Mr. K. Gammell, architect, 17, St. Peter's-street, Bedford.

Belfast.—Roman Catholic School, Willowfield; Messrs. Fennel & Clarke, architects, 7, Donegall-square, Belfast; Messrs. Feenan & Hughes, builders, Germoyne-street, Belfast.

National school, Willowfield (5,500L.); Messrs. R. Carry, Ltd., builders, 106, University-street, Belfast.

Bishop's Stortford.—Swimming-baths; Messrs. Pollard & Tingle, architect, care of Mr. T. Swarthcliffe, Clerk, Council Offices, Bishop's Stortford.

Bournemouth.—Residence, Eastcliffe; Mr. H. E. Hawker, architect, St. Peter's-chambers, Gervis-place, Bournemouth.

Brentwood.—School; Mr. F. Whitmore, architect, Duke-street, Chelmsford.

Brighton.—Convalescent home, Ovingdean Grange Estate; Mr. Henry Tillstone, Surveyor, Town Hall, Brighton.

Bristol.—School (500 places); Mr. T. H. Yabbicom, Engineer, Town Hall, Bristol.

Broadstairs.—Bank, High-street, for the London, County, and Westminster Bank, Ltd., head office, 41, Lothbury, E.C.; additions to South Court Nursing Home for Miss Dowker.

Brookholton.—Primitive Methodist church, Hague Bar, for the Trustees.

Cardiff.—Proposed offices and workshops, Womanby-street; Mr. W. Harpur, Engineer, Town Hall, Cardiff.

Clacton.—Sheltered bandstand (9,000L.); Mr. D. Lowe, Surveyor, Council Offices, Clacton.

Cleethorpes.—Shops, shelters, bandstand, etc. (600L.); Mr. E. Rushton, Surveyor, Council Offices, Cleethorpes.

Colne.—Nineteen houses, Allendale-street, for Messrs. Higgins & Payne.

Consett.—Theatre (5,000L.); Mr. J. Chaven, builder, 459, Westgate-road, Newcastle-on-Tyne.

Coppull.—Sunday-school and parish rooms for the Vicar of the Church of St. John the Divine.

Darlington.—Surgeries (630L.); Mr. C. H. Leach, Clerk, Guardians' Offices, Darlington.

Dewsbury.—Additions at Cloth Hall Mills for Messrs. Machell Brothers, Ltd., shoddy and mungo manufacturers; warehouse, Old Bank-road, for Messrs. W. & G. Hanson; conversion of premises, Huddersfield-road, into warehouse, for Messrs. S. Stross & Son, rag merchants, Kilncroft, Dewsbury.

Eastbourne.—Houses, Langney Cemetery (667L.); Mr. H. Sisley, jun., builder, 76, Langney-road, Eastbourne. Plans have been passed as follows: Seven garages, De Walden-mews, for Mr. W. Bannister; Mr. B. Stevens, jun., architect; Messrs. Peerless-Dennis & Co., Ltd., builders. Addition to Marine Hall, Longstone-road, for the Trustees; Mr. S. G. Scates, architect. Alterations to premises, Flete-road, for the Star Brewery Company, Ltd.; Mr. F. G. Cooke, architect; Mr. T. Dunlop, builder.

Folkestone.—School, Foord District (500 places); Mr. A. H. Gardner, Education Offices, Folkestone. Plans have been passed for a nurses' home, York House, Cheriton-gardens, for Miss Edden; Messrs. Bromley & Dahl, architects. Plans have also been passed for a school in Dixwell-road for Mrs. Cooper; Messrs. Bromley & Dahl, architects; Messrs. D. Baker & Co., Ltd., builders.

Fratton.—Rebuilding offices at Council School (1,848L.); Mr. S. Salter, builder, York street, Southsea.

Greenock.—Showrooms, West Blackhall-street (2,000L.); Mr. J. M'Leod, Gas Manager, Burgh Hall, Greenock.

Glasgow.—Buildings, corner of Pollokshaw-road and Langside-avenue for Mr. James C. O'Malley, spirit merchant, Crossmyloof, Glasgow. Twelve houses, off Kelvinvale-road; Mr. Gavin Allan, builder, 218, Cathedral street, Glasgow. Electricity generating-station and water-cooling tower at Clutha Works, M'Lellan-street, Plantation, for Messrs. P. & W. M'Lellan, iron merchants. Picture hall and shops, Govan-road, for the Govan Central Picture House, Ltd.

Grimby.—School, Victoria-street (13,353L.); Messrs. J. H. Thompson & Sons, builders, 107 and 109, Victoria-street, Grimby.

Harpenden.—Children's home; Messrs. Gordon & Gunton, architects, Finsbury House, Blomfield-street, E.C.; Messrs. Phillips & Blake, builders, High-street, Harpenden.

Hinckley.—Twenty houses; Mr. E. H. Crump, Surveyor, Urban District Council Offices, Hinckley.

* See also our list of Competitions, Contracts, etc., on another page.

Huddersdon.—Addition to works, Burford-street, for Mr. T. M. Gardiner, cricketing goods manufacturer.

Hollybush.—Warehouse, Tredegar-road, for Mr. E. Brice.

Hove.—Factory; Mr. W. H. Overton, architect, 22, Ship-street, Brighton; Messrs. Lynn & Son, builders, Marlborough-road, Brighton. Plans have been passed for six houses, Lyndhurst-road and Palmera-avenue, for Mr. W. H. Overton.

Huddersfield.—Bank for the West Yorkshire Bank, Ltd.; Messrs. J. S. Gibson, Skipworth, & Gordon, architects, 5, Old Bond-street, W.; Messrs. T. Bottomley & Son, builders, Brigg-house.

Hull.—School, Boulevard (5,245L.); Messrs. C. H. Paxton & Sons, Ltd., builders, 205, Anlaby-road.

Ilkley.—Picture house (3,000L.); Mr. H. Booth, architect, 42, Regent-street, Haslingden.

Inverness.—Dairy premises, Waterloo-place, for the Farmers' Dairy Company (2,800L.); Mr. T. Munro, architect, 62, Academy-street, Inverness.

Kilmarnock.—Extensions to mill for Messrs. Douglas Revburn & Co., spinners.

Leven (Pifeshire).—Additions to Northfield House (3,000L.); Mr. A. C. Dewar, architect, 10, Durie-street, Leven.

Liverpool.—Alterations to No. 60, Hanover-street (453L.); Messrs. J. H. McGovern, builders, 26, North John-street, Liverpool.

Mansfield.—Twenty-five houses for the Mansfield field Garden City Estates Company.

Middlesbrough.—Sanatorium; Mr. E. E. Burgess, Surveyor, Town Hall, Middlesbrough.

Milford Haven.—Gas plant and purifier house (725L.); Messrs. F. Lloyd & Co., builders, Charles-street, Milford Haven.

Swansea.—Church; Mr. G. Halliday, architect, 19, Castle-street, Cardiff.

Newquay.—Block of shops; Mr. E. I. Ennor, architect, Bank-street, Newquay.

North Allington.—Eleven houses (1,870L.); Messrs. Francis & Co., builders, Bournemouth.

Northampton.—Houses, Bective Estate, Kingshorpe (24,300L.); Mr. A. Fidler, Engineer, Town Hall, Northampton. The following plans have been passed:—Rebuilding of "Bull and Butcher" Inn, Bridge-street; alterations to "Ram" Hotel, Sheep-street; additions to Franklin's Garden Hotel, Weeden-road; and garage, Cattle Market-road, for Messrs. P. Phipps & Co., Ltd.; extensions to premises, Crane-street, for the British Crane Tanning Company; drill hall, Grafton-square, for the Trustees of the Grafton Lads' Institute; three houses, Moore-street, for Mrs. C. Varnes; four houses, King Edward-road, for Messrs. A. & W. Cleaver; engineering workshops, Kingshorpe-road, for the Advance Motor Engineering Company, Ltd.; extensions to factory, Clare-street, for the Pioneer Boot Company; three houses, Loyd-road, for Mr. W. C. Throssell; four houses, Clarence-avenue, for Messrs. E. Archer & Sons; alterations to factory, Abington-grove, and erection of factory, Holly-road, for Mr. C. E. Gubbins; alterations to Freeman's Arms, Ballif-street, for the Northampton Brewery Company, Ltd.

Norwich.—Wensum View School; Mr. C. J. Brown, architect, Cathedral Offices, Norwich.

Pembroke.—Housing scheme (60,000L.); Surveyor, Council Offices, Pembroke.

Penzance.—School; Mr. B. C. Andrew, architect, Biddicks-court, St. Austell. Hotel; Messrs. Cowell & Druff, architects, Penzance.

Pontefract.—Baths (6,000L.); Mr. A. Nun-week, 87, Fargate, Sheffield.

Potterhanworth (Lincoln).—Eight houses (1,408L.); Messrs. Wallhead Brothers, builders, Ruskington, Stelford.

Preston.—St. Anne's Roman Catholic Church (4,000L.); Messrs. Pugin & Pugin, architects, 51, North John street, Liverpool.

Purleigh (Essex).—School (3,000L.); Mr. F. Whitmore, architect, Duke-street, Chelmsford.

Reading.—Erection of the Hendrick Schools; Mr. W. S. Clutterbuck, Clerk, Town Hall, Reading; architect to be appointed by competition.

Rochdale.—School, King's-road; Mr. E. J. Holden, Education Offices, Rochdale.

Rosyth.—Institute (20,000L.) for the Y.M.C.A. Sheffield. The following plans have been passed:—Motor garage, Broughton-lane, stores, etc., Charnes and Ribblesdale, and alterations to premises, Eldon street, for the Brightside and Carbrook Co-operative Society, Ltd.; additions to premises, Savile-street, for Messrs. Cammell, Laird, & Co., Ltd.; additions and alterations to Fitzalan Tavern, Fitzalan-street, for Messrs. W. Stone, Ltd.; house and transformer station, Bradfield-road, for Electricity Supply Department, Sheffield Corporation; additions to premises, Savile-street, for Messrs. J. Holding & Co., Ltd.; additions to Prince of Wales' public-house, Derbyshire-lane, and additions to Shipley Hotel, Bradfield-road, for Messrs. T. Berry & Co., Ltd.; additions and alterations to Well-

ington Hotel, Brightside-lane, for Trustees.

Mr. R. J. Bentley; additions to premises, Lydgate-lane, for the Crookes Orphan Homes Committee; additions to premises, Gibraltar-street, for Messrs. S. Walker, Ltd.; five houses, Liberty-hill, for Mr. Barker; additions to premises, Sheffield.

Tinsley, for Messrs. Hadfield's Steel Foundry Company, Ltd.; four houses, Crimcar, for Messrs. S. Hancock & Sons; additions to premises, South street Moor.

Stafford.—Theatre, Martin-street; Mr. I. Mosses, Boots, Ltd.; additions and alterations to premises, Dixon-lane, for Messrs. I. Bramwell, Ltd.; four houses, Archer-road.

Mr. F. Wolstenholme; alterations to premises, Leigh-street, for Trustees, Baptist Church.

alterations to premises, York-street and Head, for Sir W. C. Long & Co., Ltd.; four houses, Greystones and Horncastle roads.

Mr. J. A. Wrang; additions and alterations to "Star of Lemont" public-house, Hermitage, for Mrs. Mason; three houses, W. bank-lane, for Mr. Percy Cooper.

St. Paul's, Glasgow.—Theatre, Martin-street; Mr. I. Mosses, architect, Wolverhampton.

Swansea.—Cinema theatre; Mr. W. Jones, architect, 41, Wind-street, Swansea.

Tenterden.—Motor garage, East Cross Street, Messrs. Siminon & Co., motor engine.

Torquay.—Plans have been passed follows:—Alterations to Bannercross Inn, the Plymouth Breweries; four houses, burn-road, for Mr. E. Green; eleven houses adjoining Parkfield-road, for Mr. J. Tucker. Plans have been lodged for six houses and café and shops, Babbacombe road, and houses, Walls-hill-road, for Mr. S. Blatch.

Torrington.—Territorial headquarter Messrs. Ellis, Son, & Bowden, Bedford-croft, Exeter.

Turton.—Proposed weaving shed for Turton and Edgeworth Mill Building Company.

Waterfoot.—Chapel school, Burnley, for the Trustees of St. Peter's Roman Catholic Church, Newchurch.

Waterloo (Liverpool).—School (400 places); Mr. H. Little, architect, 16, Ribblesdale-preston.

Wednesbury.—Institute, Darlaston road, the Patent Shaft and Axletree Company, Wednesbury.

West Thurrock.—School (300 places); F. Whitmore, architect, Duke-street, Chelmsford.

Whitstable.—Picture palace, High-street, the Whitstable Electric Theatre Company, Wick. Post-office, Market-place (7,000L.); Mr. A. Hall, builder, Mile Joinery Works, Abberdon.

Willington Quay.—School (1,400L.); Rev. Hostler, Vicar, St. Aidan's Roman Catholic Church.

Wilton Gilbert (Durham).—School houses East End Industrial School (600L.); Douglas, builder, Closa House, Durham.

Woking.—Motor garage; Messrs. Tubbs-Messer, architects, The Broadway, Woking.

Woodford Bridge.—Temporary school (400L.); Messrs. E. Smith & Co., builders, Woodford Bridge.

Worcester.—Proposed school (11,500L.); A. G. Parker, architect, Town Hall, Worcester.

Wrexham.—Mortuary; Mr. J. England, surveyor, Town Hall, Wrexham.

Ystrad.—Picture theatre; Messrs. W. & Son, Ystrad.

FOREIGN AND COLONIAL

School Partitions, Malta.

The Commercial Intelligence Bureau of Board of Trade is notified by the Colonial Agents for the Colonies that sealed tenders will be received at the Office of the Receiver General and Director of Contracts, Valletta, up to 11 a.m. on October 17, for the supply of school partitions. Tenders are to be accompanied by a deposit of 10% of the specification and form of tender may be obtained on application to the Crown Agents for the Colonies, Whitehall-gardens, London S.W.

BUILDING BY-LAWS.

At a meeting of the Committee of the British Constitution Association, held at its office, Tothill-street, on Friday, October 1, the following resolution was unanimously passed:

"That this Committee, acting in the interests of individual liberty and personal responsibility, cordially welcomes the recent circular of the Local Government Board in favour of seeing the more flexible application of building by-laws in rural areas, and engages itself to do its utmost to influence the sanitary authorities to give subject their most careful attention."

TRIBUNAL OF APPEAL UNDER THE LONDON BUILDING ACT.

Allen & Norris v. Superintending Architect of Metropolitan Buildings.

On Tuesday the Tribunal of Appeal under the London Building Act sat at the Surveyors' Institution to consider the appeal by Messrs. James Gilbert Allen and Henry George Norris against the certificates of the Superintending Architect of Metropolitan Buildings fixing the general line of buildings on the northern side of the street known as Fulham Palace-road, between Queensmill-road and the building known as 206, Fulham Palace-road. Mr. Courthope Munroe appeared for the appellants and Mr. F. Daldy represented the London County Council.

Mr. Courthope Munroe, in opening the case, claimed that the appellants were builders of houses, who were developing a considerable estate to the north of the present proceedings were by a sequel to a former appeal to the Tribunal, which was heard on December 12, 1911, and January 22 and March 1, 1912. In the present case the Superintending Architect had defined the line of buildings as between Queensmill-road, in relation to the buildings shown on the plans, and the line of such definition would mean cutting about 1 ft. from three of the shops and about 2 ft. 6 in. in the case of the other four. In previous cases had regard to four shops situated in Fulham Palace-road on the other side of the road to the seven shops in question, and it was then urged that the Superintending Architect had taken a ridiculous extent of road for the purpose of fixing the building line. Ultimately the Tribunal decided that there was no general line of buildings in that portion of the road in which the seven shops were situated, and consequently the decision of the Superintending Architect was reversed. He and his clients took it that this decision of the Tribunal meant that there was no general line of buildings on the whole of the section of the land which was then being erected to.

The Chairman (Mr. A. A. Hudson): We indicated that these four buildings might be the basis of forming a building line. Mr. Courthope Munroe said he did not expect for a moment that they might not do so. The position his clients took was that after this decision they were entitled to go on building so long as they did not advance beyond the line of the four shops, and they had decided to build the seven shops on that assumption. These seven shops were an exact replica of the four. They were set back 30 ft. from the middle of the road, but, owing to the contour of the road, they were really only 2 ft. behind the four shops. He submitted that there was no building line at the north corner of No. 206, which was one of the four shops, to the north-east corner of the parish hall at Crabtree-lane; or, in other words, that the line was controlled by the four shops, and if they kept a minimum of 30 ft. from the centre of the road they were within their rights. The Superintending Architect commenced by going back 2 ft. 6 in. from the corner of No. 206.

The Chairman said the point they had to find out was whether that portion of No. 206 which projected beyond the line fixed by the Superintending Architect was a building or not.

Mr. Courthope Munroe contended that in all circumstances no question of projections arose. If they were building in a place where there was no general line of buildings they had no right to consider projections at all. Sect. 73 of the Act only came in and entitled a person to make projections beyond the line in certain cases, and this, of course, presupposed a building line. In the case of the four shops the building line was the building line, and hence the question did not arise. The seven shops were continuous with the four, and there were no projections. The Superintending Architect in order to go back 2 ft. 6 in. had treated the architectural detail of the four shops as projections.

The Chairman said he did not quite understand why the Superintending Architect had taken the line back from the 2 ft. 6 in. In the present case it was not a question of a small projection, but the whole of the buildings were brought forward.

Mr. Daldy said he would argue the point later, but, so far as he knew, the front main wall was always taken to determine the general building line.

Mr. J. J. Radford, architect and surveyor, of 10, Upper Richmond-road, Putney, explained the situation of the houses. The shop fronts were superimposed on the cellar wall. Above the shops were two floors, and bay windows were formed by recessing the front main wall. In cross-examination, witness said he took it

that the four shops fixed the general line of buildings at one end, and he would take a line parallel with the projections at the north-east corner of St. Clement's Church to fix the general line of buildings.

Mr. C. Botterill, surveyor, of Fulham, formerly Surveyor to the Borough Council, endorsed the evidence of the last witness, and put in a plan showing how he would fix the line, having regard to the curve of the road.

Mr. H. G. Norris, Mayor of Fulham, one of the appellants, described the buildings, and said the centre of the road was taken from a plan supplied by the Superintending Architect.

In cross-examination, witness said they commenced to build the seven shops the day after the Tribunal had given its previous decision. The foundations had already been got out nearer the road, but after the decision they decided to keep at least 30 ft. from the centre of the road in accordance with the wishes of the County Council. His view was that they were entitled to build so long as they did not go beyond the four shops. He did not think it was necessary to ask the Superintending Architect to define the general line of buildings, as it seemed to be foolish to make such a request when the Tribunal had just decided that there was no line.

The Chairman: You took the risk of defining the line yourself.

Witness said he had the certificate of the Tribunal before him stating that there was no general line of buildings in that section of the Fulham Palace-road. His view was that they must either keep level with or behind those four shops.

This concluded the case for the appellants, and Mr. Daldy called Mr. Milward, of the Architects' Department of the London County Council, who expressed the opinion that the line defined by the Superintending Architect was the right one.

Mr. Daldy addressed the Tribunal, and submitted that the Superintending Architect had fixed the line in a *bona-fide* manner, and Mr. Norris had fairly admitted that he took his risk as to what the line might be. He urged that, as a matter of law, the front main wall of the houses ought to be taken into consideration. The whole object of setting back the buildings to the building line was not to preserve the centre of the roadway, but to preserve the general line of the houses in the interests of the houses themselves. If it was held that the extent outside of a bay window was to determine the general line of buildings, then a man having once put up a bay window his neighbours would be entitled to carry up their walls vertically to the edge of the window. In the present case the general line of buildings between Crabtree-lane and Larnoe-road was made to depend on the end from which the appellants started their buildings, and they contended that No. 206 was to govern the whole thing. The Superintending Architect had, however, said they must look at the buildings beyond, and take these into consideration, and he had drawn his line accordingly.

Mr. Courthope Munroe asked the Tribunal to view the road and buildings, as the matter was one of importance to the appellants, who did not want to have to come before the Tribunal the next time they commenced building.

The proceedings were accordingly adjourned to give the Tribunal the opportunity of visiting the site.

LEGAL COLUMN.

Vendor v. Purchaser.

In the recent case of Taunton and West of England Perpetual Benefit Building Society and Roberts' Contract (current "Law Reports"), the Building Society were the mortgagees by assignment of the residue of a lease for 999 years of certain property, and they entered into a contract to sell the same to one Roberts. The contract was an open contract, and amongst other clauses it contained a provision that the property was sold subject to the covenants and conditions contained in the lease and to the rent thereby reserved, and that the assignment to the purchaser should contain a covenant indemnifying the Society against the said rent and covenants.

There were in the lease covenants as to painting of an unusual character, to be contained in a lease for so long a term, and at the time fixed for completing the contract the lessor was threatening proceedings for breaches of covenant; but neither the vendor nor the purchaser were aware of this. In answer to requisitions, the vendors only offered to produce the last receipt for rent. The purchaser was seeking a declaration that a good title had not been shown, and claimed a return of the deposit.

As regards the first point, the clause as to indemnity against breach of covenant, the Court held this to relate to future breaches or

failure to pay rent, not to breaches in the past. On the second point the Court held the vendors not to have made out a good title, as the lease had become forfeitable. The vendors were selling under open contract, and were under obligation to show that the rent had been paid and the covenants performed. Sect. 3, sub-sect. 4, of the Conveyancing Act, 1881, does not take away this obligation; that sub-section means that, *prima facie*, the receipt for the last rent is evidence of the covenants having been duly performed, but it does not prevent a purchaser from adducing evidence that, in fact, the covenants have not been performed. It is necessary to bear in mind that this was an open contract, and that the purchaser had had no notice of the breach, as the decision turns on these two considerations.

LONDON COUNCILS.

Barnet.—The Urban District Council have passed amended plans for the erection of a cinematograph theatre at the rear of No. 122, High-street. The Surveyor has been instructed to prepare a scheme for the utilisation of the Old Barnet Brewery site.

Battersea.—Plans have been lodged with the London County Council by Messrs. Spalding & Myers for the erection of additions to the Baptist Chapel in Northcote-road.

Bromley.—The Council have accepted the tenders of Messrs. E. Peill & Sons, Bromley Common, at £731, for making up Quernmore-road, 123 ft., for making up Nightingale-lane, and 431 ft., for making up Talbot-road. The tender of Messrs. T. Wood & Sons, Ltd., Crookhill, Swanley, has also been accepted, at £491, for making up Pinewood-road.

Bulding.—Sanction has been received from the Local Government Board to the borrowing of £7,067, the cost of erecting a secondary school and technical institute.

East Barnet.—A Sub-Committee has been appointed to consider the question of the housing of the working-classes. A plan has been passed for Mr. Geddes for the erection of a motor garage in Northumberland-road.

Enfield.—The Urban District Council has accepted the tenders of Messrs. Jennings & Grenfell, Froozywater, Waltham Cross, at £601, and 1,175, for making up portions of Malvern and Durants roads, respectively.

Hammermith.—The tender of the Adamant Stone Paving Company, 9, Bridge-street, Westminster, S.W., has been accepted by the Borough Council, at £508, for paving the footpath on the east side of a portion of Wood-lane.

Hanwell.—The Surveyor has been instructed to prepare a plan for the general widening of Boston-road. The tender of the Improved Wood Pavement Company has been accepted at 452. 6s. for wood-paving the same road.

Hornsey.—The Highways Committee report the receipt of petitions asking that the asphaltting of the carriageway of Fortis Green-road be continued for about 192 yds., owing to the motor-omnibus traffic. The Borough Surveyor, reporting on the question, states that the effect of this traffic upon the carriageways of Fortis Green, Fortis Green-road, and Colney Hatch-lane, macadam roads unsuitable for such traffic, has been disastrous. It is evident from the continuous repairs already carried out that the greater portion of the length of macadam road affected cannot be maintained by ordinary macadam repair during the autumn and winter months, and, unless a more permanent class of construction is immediately adopted with the roads will become untrafficable. If the motor-bus traffic is to be permanent the best method, and, in the long run, the most economical, would be to construct these roads, except where the gradient is prohibitive, with a good concrete foundation and close-jointed, creosoted, soft wood-block paving; but such a scheme would necessitate the raising of a loan, and it would be some months before it could be carried out. It would, therefore, appear desirable to consider an intermediate, although much less durable, method of stripping off the existing macadam and laying down a tar or bituminous macadam carriageway, which, if tenders were immediately invited, could be proceeded with in November. He estimates the cost at 3,350. The Surveyor's suggestions are to be carried out. The following plans have been passed:—Mr. A. C. Dickie, alterations and additions to "Hillside," Jackson's-lane, Highgate; Mr. François Howkins, Golden's Green, thirty houses, Rectory-gardens; Mr. John Farrer, parish hall, Park-road, Crouch End.

Islington.—For testing the suitability of several forms of bituminous paving for use on roads where ordinary macadam is not suitable, the "Trinidad asphalt factory," "Roadament," "Trinidad asphalt macadam," "asphalt macadam," "Val de Travers" natural asphalt matrix," and

"Bradshaw's granite asphalt" are to be laid in equal lengths on the margins of the carriage-way in Dorset-street. The estimated cost is put at 476s. The wood-paving in portions of Horseay-road, Horsely-croft, Seven Sisters-gate, and Holloway-road is to be renewed or relaid at estimated costs of 300l., 200l., 300l., and 600l. respectively, and the creosoted yellow deal blocks required are to be obtained from Messrs. Gabriel, Sons, & Bartons, Commercial-road, Lambeth, S.E. Jarrah blocks are also required, and tenders are to be obtained for these.

Hornford.—At a recent meeting of the Guardians it was decided to carry out by direct labour the building of an isolation hospital. The estimated cost is put at 484s.

Southgate.—The following plans have been passed:—Mr. W. R. Bertie, three houses, Lodge-drive, Palmer's Green; Mr. R. Cracknell, forty-one houses, Riverway, Palmer's Green; Mr. W. J. Keene, jun., three houses, Amberley-road; Mr. W. A. Arnold, three houses, The Crest, Palmer's Green; Mr. A. Arnold, three houses, Harlech-road; Mr. D. A. Paul, Presbyterian Church, Fox-lane, Palmer's Green; Mr. A. F. Simmons, three motor garages, Light-lane, Palmer's Green.

Tottenham.—The Engineer has been instructed to prepare quantities with a view to tenders being invited for the execution of private street works in South-grove and Barry-avenue. The following plans have been passed:—Messrs. Warren & Supert, on behalf of Mr. H. King, additions to Swan Hotel, High-road; Mr. F. Horton, additions to Godfrey Engineering Works, Boundary-road; Mr. S. W. Cranfield, reconstruction and additions to drill hall, Park-lane; Messrs. Brand, Pettitt, & Co., addition to Munro's factory, Cornwall-road; Mr. H. S. Couchman, on behalf of Mr. J. Immig, additions to bakery, High-road; Messrs. C. D. Monniger, Ltd., factory, Overbury-road; Mr. D. Gestner, foundry at Cyclostyle Works, Broad-lane; Messrs. Rowley Brothers, Boundary Works, Crawley-road, Wood Green, five houses and shops, Lordship-lane.

Westminster.—The tender of Messrs. Wright & Son, 27, Wild-street, Drury-lane, W.C., has been accepted at 74l. 15s. for carrying out the necessary works in connexion with the rounding off of the corner of Buckingham Palace-road and Piccadilly-road. The necessary paving and other work in connexion with the opening through of Noel-street to Great Marlborough-street is to be carried out at an estimated cost of 1,800l. The Engineer has been instructed to proceed with the work in connexion with the widening of Piccadilly, opposite Nos. 19 and 20, at an estimated cost of 750l. Repairs are to be carried out to the macadam carriageways of Grosvenor-road and Warwick-square at an estimated cost of 375l. Repairs are to be carried out to the footways of Park-street. The cost is put at 100l. Paving works are to be carried out opposite Nos. 44-46, Park-street at an estimated cost of 1,000l. In view of the probability of the Council's property, now occupied by the Westminster Workhouse, in Soho coming to the Council's possession the Housing Committee have decided to prepare a scheme for the erection of working-class dwellings. The London County Council:—Messrs. Maple & Co., Ltd., alterations to St. James' Club, Brick-street; Messrs. Bywaters & Sons, Ltd., alterations to premises, Wellington-mews and Ham-yard, Great Windmill-street; Messrs. A. E. Hughes & Son, building site of White Lodge, Warwick-row.

Willesden.—Tenders are to be invited for making up Victoria-mews, Kilburn, and Kildorpe-terrace, Dog-lane. Plans and estimate submitted by the Engineer have been approved for making up Brampton, Ridley, and Colin roads. The following plans have been passed:—Mr. H. Fowler, six houses, Palmer-road, Harlesden; Mr. G. A. Sexton, on behalf of Messrs. H. Saby & Co., furniture depository, rear St. Priory Park-road; Messrs. William Moss & Sons, additions at Parish Workhouse and Infirmary, Acton-lane; Mr. A. Baker, on behalf of Messrs. Charrington & Co., extensions at Elm Tree, beerhouse, High-street, Harlesden. Plans have been lodged by Mr. R. Cave for the erection of nine houses in Tatum-road.

Woolwich.—The Borough Council have received a communication from the London County Council, in reply to a letter urging amendment of that part of the London Building Act, 1894, which relates to the fees chargeable by district surveyors, stating that from but that having regard to the peculiar position of London, so far as the administration of its method has not been suggested which would remove existing anomalies without increasing

the cost of the administration of the Building Acts in London, and that under the circumstances they do not see their way to take action in the matter at present. The Borough Council have decided to ask the Council to give the matter further consideration at the earliest opportunity. The following plans have been lodged with the London County Council:—Mr. F. H. Buen, 12, Woodland-avenue, Wanstead, adaptation of building at rear of Castle Hotel, High-street, Eltham, into cinematograph theatre, Mr. A. L. Edwards, 19, Ragland-road, Plumstead, houses, Cleanthus-road, Plumstead; Mr. R. Stewart, 24, Sloane-square, S.W., houses, Bexley-road; Mr. A. H. Jennings, 7, Woolwich-road, Belvedere, twelve houses, Cantwell-road, Plumstead. Plans have been passed for Mr. L. A. Stanton, 110, High-road, Lee, S.E., for six houses, Halons-road, Eltham, and for Messrs. Gordon & Gunton, Finbury House, Blomfield-street, E.C., for a Wesleyan chapel and institute in Timbercroft-lane, Plumstead. Mr. J. O. Cook, architect, on behalf of Mr. E. Kemp, has lodged plans for the erection of a warehouse and shop in Spray-street, Plumstead.

OBITUARY.

Mr. G. T. Redmayne.

Mr. George Tunstall Redmayne, of whose career Mr. Paul Waterhouse gives some particulars in the current *Journal* of the Royal Institute of British Architects, was articled to Mr. Alfred Waterhouse, R.A., and practised in Manchester. "He was never greedy for multiplicity or magnitude of work," writes Mr. Waterhouse. "His personal thought and personal labour entered every detail of his designs, and he was exceptionally careful in making sure that nothing should appear in his work which was meaningless or nugatory. His comparatively small list of executed works is, therefore, not by any means to be attributed solely to lack of opportunity. Among the buildings in which he best satisfied his own intentions were:—The Scottish Widows Office, Albert-square, some business premises at No. 20, Cross-street (recently altered), the School of Art, and the Racquet Courts, all in Manchester. His two best country houses were Whitton, in Herefordshire, for Mr. Richard Green, and Fekedmore, in Surrey, which he built *à deux reprises* for his brother-in-law, Mr. Edwin Waterhouse. His best church, St. Chrysostom's, Victoria Park, Manchester, was unfortunately destroyed by fire. Other of his buildings were a house at Mayfield, in Staffordshire, for Mr. Joseph Simpson; the Dalton Hall, Manchester, for the Society of Friends; Schools at Knutsford and Broadbent, and various small works at Ambleside and Alderley. Many of these buildings show that he was capable of carrying out work on an important scale; the Scottish Widows Building in particular is as good a proof as one could have that there was real sense and real sense in that medieval revival which is to-day so readily despised. It is virile and fresh."

PATENTS.

APPLICATIONS PUBLISHED.*

19,853 of 1911.—Emile Klée: Hollow reinforced concrete floors, ceilings, and the like.
20,202 of 1911.—James Ward Moseley: Wall construction for houses and other buildings.
20,535 of 1911.—August Weiffenbach and Michael Joseph Farrell: Composition for plaster and the like.
20,650 of 1911.—Francis Skilbeck: Plastico composition.
21,200 of 1911.—Francis Parvey Le Bailly: Mode of glazing roofs, windows, and the like.
21,550 of 1911.—Frank Herbert Shorland: Fireplaces.
21,366 of 1911.—Isaac Henry Storey, William Edward McCalla, and Arthur Griffiths: Facing plates for attaching to the surface of walls and the like.
24,764 of 1911.—Edgar William Brown and Charles James Watts: Combined screen and stove or radiator.
27,232 of 1911.—Daniel Murphy: Bolts for doors, gates, and the like.
27,754 of 1911.—John Shanks: Supply connections for cisterns of an installation of water-closets and the like.
27,838 of 1911.—Giuseppe Andina and John William Bottomley: Kilns for burning or firing bricks, tiles, or other earthenware, fire-clay, or like goods.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

909 of 1912.—Joseph Schwend: Chimney.
1,711 of 1912.—Ellen Chandler and E. Corin: Sinks.
2,251 of 1912.—Thomas Boyd: Attachment for glazing bars.
3,452 of 1912.—Thomas Joseph Be.
Road compositions.
13,479 of 1912.—John Caldwell: Door-l.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointment, xix.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

OCTOBER 14. **Batham. SWIMMING BATH.**—Wandsworth B.C. invite designs for a new Swimming Bath. See advertisement in issue of August 16 for further particulars.

OCTOBER 20. **Glasgow.**—DESIGNS FOR EXTENSION OF MUNICIPAL BUILDINGS.—The Glasgow City Council invite the architects to submit preliminary sketch designs in competition for the extension of the Municipal buildings. Five will be selected to submit complete drawings in final competition. See advertisement in issue of October 12. Dr. Burnet, assessor. Deposit of 11. 1s.

OCTOBER 31. **Huddersfield.**—TOWN PLANNING.—The Huddersfield Corporation invite tenders for the laying-out of certain areas within county borough and part of an adjacent parish. Premiums 100s., 50s., and 25s. Deposit of 21. 2s. See advertisement in issue of September 2 for further particulars.

OCTOBER 31. **Llandudno.**—LANDSCAPE GARDENING.—The Llandudno U.D.C. invite tenders for laying-out land adjoining the Happy Valley, about 20 acres in extent. See advertisement in issue of September 6 for further particulars.

NOVEMBER 1. **Ottawa. MONUMENT TO KING EDWARD VII.**—Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa. Particulars from the Public Works Department, Ottawa (see p. 174, August 9).

NOVEMBER 28. **Langside, Glasgow.**—BRANCH HOUSE.—Assessor, Mr. Alex. J. Patterson, S.A. Premiums, 50l., 30l., and 25l. Particulars from the Town Clerk, City-chambers, Glasgow.

NOVEMBER 1. **Sofia. DESIGNS FOR A ROYAL RESIDENCE AND LAW COURTS.**—Particulars from the Imperial Intelligence Branch of the Board of Trade, London, S.W. (see p. 173, August 9, and p. 350, September 27).

NOVEMBER 2. **Carlisle.**—SCHOOL BUILDINGS.—Particulars from the City Surveyor, 36, Market-street, Carlisle.

NOVEMBER 1, 1913. **Rangoon.**—MUNICIPAL BUILDINGS.—The Committee of the Municipality of Rangoon invite designs for the new Municipal Buildings, Nos. 3001, 3002, and 1001, respectively for first, second, and third. See advertisement in August 2 and 30 for further particulars.

OCTOBER 2. **Jordanhill, Glasgow.**—PROPOSED NEW COLLEGE.—Limited to six firms, namely: Messrs. James Watson & Co., Ltd., Messrs. James Watson & Co., Ltd., Messrs. James Watson & Co., Ltd., Messrs. James Watson & Co., Ltd., Messrs. James Watson & Co., Ltd., Messrs. James Watson & Co., Ltd. See advertisement in issue of September 2 for further particulars.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

OCTOBER 11. **Nairn.**—GROYNES.—For construction of timber groynes, 150 ft. long, on the fore- and back of the harbour. Plan specification from Mr. D. Munro,burgh, Nairn.

OCTOBER 11. **Bradford.**—LIBRARY.—Erection of a new library at Great Horton. Drawings and conditions of contract seen, and quantities and form of tender from the City Architect, Bradford.

OCTOBER 14. **Dundalk.**—SNOW.—The Great Northern Railway Company (Ireland) invite tenders for the erection of an electric and general lighting system at Dundalk. Drawing and specification at the Engineer's Office at Dublin and at the Engineer's Office at Dundalk.

OCTOBER 14. **Eccles.**—PAVILION.—For taking and removing the existing bowhouse, and erecting a new pavilion, bowling green, and alterations to the playground, also for the construction of an oval bowling green at the same ground, at the Borough Surveyor's Office, Town Eccles. Quantities on deposit of 11.

OCTOBER 15. **Rawdon.**—SCHOOL.—For erection of a new school at Rawdon. Plans and specifications at the Borough Surveyor's Office, Rawdon. Mr. H. Chippindale, architect.

OCTOBER 15. **Stanley.**—SCHOOL.—For remodeling and erection of new infants' school at Stanley, near Crook. Plans, specification, and general conditions of contract seen, and quantities at the office of Mr. W. Rushworth, Shire Hall, Durham.

OCTOBER 15. **Stockport.**—SHELTER, ETC.—For erection of shelter, tool-house, and conveniences at Grimsbottom recreation ground. Plans, sections, and general condition seen, and specification, with form of tender, from Mr. J. Atkinson, A.M.Inst.C.E., Borough Surveyor, Town Hall, Stockport.

OCTOBER 16. **East Langton.**—COTTAGES.—The Midland Railway Company invite tenders for the erection of two cottages at East Langton. Plans and specifications seen, quantities and particulars at the Engineer's Office, Derby Station.

OCTOBER 16. **Halifax.**—EXTENSION.—For extension of office and new building, for Messrs. J. Sagar & Co., Ltd., Water-lane. Plans seen, and quantities from Messrs. Jackson & Fox, Rawson-street, Halifax.

OCTOBER 16. **Milnabridge.**—WORKSHOP, ETC.—Erection of workshop, etc. Plans seen, and quantities from Messrs. Lunn & Kaye, architects and surveyors, Milnabridge.

OCTOBER 18. **Belfast.**—MACHINERY.—Erection of refrigerating machinery for chill-rooms at the new Public Abattoir. Drawings, specification, and particulars from the City Surveyor. Deposit of 11. 1s.

OCTOBER 18. **Brecon.**—SCHOOL.—For proposed mixed and infants' school and cookery kitchen at Caechopin, Abercave. Mr. C. W. Best, M.Inst.C.E., Surveyor to the Breconshire Education Committee, County Hall, Brecon.

OCTOBER 18. **Dinnington.**—ADDITIONS.—For additions to Dinnington Council School. Plans seen, and specifications, with quantities, from the Education Architect, County Hall, Wakefield. Deposit of 11. 1s.

OCTOBER 18. **Stainton.**—SCHOOL.—For erection of a new school. Plans seen, and specifications, with quantities, from the Education Architect, County Hall, Wakefield. Deposit of 11. 1s.

OCTOBER 19. **Wheatley.**—SCHOOL.—For erection of Boys' and Girls' Council School. Plans seen, and specifications, with quantities, from the Education Architect, County Hall, Wakefield. Deposit of 11. 1s.

OCTOBER 19. **Egremont.**—RESIDENCE.—For erection of a new residence at Bookwell, Egremont. Plans and specifications with Mr. N. Kitchen, M.I.Mun.E., A.R.S.I., etc., architect, Woodhouse House, Birgitz.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

*N.B.—Illustrations of the First Promoted Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

*Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

ST. PAUL'S CATHEDRAL AND ITS MONUMENTS.

IN Florence, over against the Duomo—St. Mary-of-the-Flower, as the Italians so beautifully call it—stands a white marble figure of Brunelleschi, with arms upraised and gazing at the dome he built. The statue, it is true, is not a fine work of art, but the idea is good—to make the architect guardian of what is the flower of his art. Not all artists are worthy to stay thus for all time in contemplation of their work. For most, with opened eyes, it could be too Dantesque a punishment. But there are some whose work becomes more and more of a precious heritage with the passing years, and whom it would be well to commemorate in this way.

This would besides give encouragement to sculptors, would interest the public in their work. And, although it may seem that modern art lacks somewhat of the greatness of ancient art, it is only because we put these new years against the centuries. For if there have been periods more favourable than others to the growth of art, we must always remember that the ages have left only their best; by slow degrees, as with books, so it is with

pictures and sculpture—the inferior gets removed to limbo beyond the orbit of our vision. We must always remember that thousands of years went to the making of the fine “Flowers of Art” left with us. So to-day, if we have to eliminate somewhat, there will surely be something remaining worth remembering. Why not make use, then, of the talent we have while it is yet day? It has always seemed curious to us that there is no statue to Wren in the metropolis. It is true his manifold works are his best monument, but that is no reason it should be his only one. Indeed, if we consider, there would be no monuments—except to those who have no claim on us—if a man's work were considered sufficient. That is his part; ours to show in some visible and enduring way our appreciation of it.

Thinking of Florence, where Brunelleschi is graciously given a little space where he may stand somewhat apart from the bustle of life to contemplate his dome, where streets are given the benediction of a verse from Dante—couplets, as the reader knows, are put up on the coigns of

buildings—we never pass St. Paul's without looking to see if there is not a statue of Wren looking over to the church whose building occupied the best years of his life. We always half expect to see him standing in front of the Chapter House, with eyes raised to the dome, his fine face set in the cast of an humble pride, with one hand stretched out as if to follow its beautiful contours.

Wren's great heart lies still beneath the dome he raised. He was brought back to rest there five years after his patent had been suspended in favour of William Benson. A simple slab marks his grave, inscribed without ostentation or flattery with the plain fact that “Here lieth Christopher Wren, Kt., the Builder of this Cathedral Church of St. Paul,” etc. And on the wall above his epitaph is written, concluding with the oft-quoted words, *Lector, si monumentum requiris, circumspice* :—

Obiit xxv. Feb. an. MDCCXXXIII.
Aet. lxx.

Robert Mylne, who was appointed Surveyor of St. Paul's in 1766, repeated the epitaph upon the marble choir screen

which was afterwards removed and placed in the north transept, where it now stands, forming an entrance portico. The thought which inspired "If you will have a monument, look around" is a fine one; but is it sufficient? A large proportion of the monuments in the upper church are dedicated to the memory of soldiers and sailors, a fact which can be accounted for by the breaking down of the prejudice against allowing memorials in the new Cathedral at the time of the Napoleonic wars. Alfred Stevens's Wellington Memorial, a consummate work of architecture and sculpture, is by far the most beautiful—indeed, it is probably the finest monument made in the XIXth century, whether we consider the delicate proportions of the architecture, the quality of the sculptures in bronze or marble, or the way in which the whole design fits within the arch of the Cathedral. The addition of the equestrian statue, whether this was well advised or not, certainly has had the effect of at least completing the composition in relation to its setting. Wellington is buried in the crypt, just eastward of the dome. His sarcophagus, from the design of Cockerell, consists of two blocks of Cornish porphyry superimposed upon a high base of granite, and is of austere simplicity, noteworthy, however, if we may compare little things to great, as the pyramids are, for some quality other than beauty.

There is a simplicity as of the Greeks, as of some lyrical poetry, before which we pause at a loss to apprehend the reason of its subtle spell; verses of the Bible, the verses of Shakespeare and Burns, some of the poetry of Wordsworth, the Greek temples hold us by this strange and wonderful quality. But there is another simplicity which in effect is emptiness. The Wellington sarcophagus is somewhat akin to the last, yet we cannot but feel how greatly it is to be preferred, as a thing of art, to many of the more recent monuments, or to the mosaic decorations.

Nelson's tomb is much better. Whilst being simple enough not to tease the eye to find its contours in the dim light of the crypt, it conveys to the senses an effect of funereal sumptuousness, if such a phrase may be allowed, of dark but rich colours, the black of touchstone, the red of porphyry, and the fine gold of artifice. The black sarcophagus, which rests on a high plinth, is profiled somewhat in the shape of a casket, a form which has become common in the sculpture of the monument. Indeed, Wellington's effigy rests on a similar sarcophagus; so also do those of Lord Leighton and General Gordon. But a comparison of these monuments will show how easy it is for the individual to express through any given traditional form whatever in him lies of aptitude for art. The sarcophagus in the first of these is extremely beautiful; it is built up tier upon tier to the final casket on which the figure rests; a variety of suitable ornaments diversify and add interest to its bold outlines without detracting from the unity which inspires the idea of the thing.

The history of Nelson's monument is a curious one. Cardinal Wolsey brought Benedetto da Rovezzano from Italy and engaged him to make his tomb, on

which he worked for six years before the Prelate's death without bringing it to a conclusion. Henry VIII., coveting and intending it for himself and Anne Boleyn, ordered its completion. Some of the bronze figures forming part of the tomb were sold by the order of Parliament at the time of the Commonwealth, but it was never used, and the casket part of it was brought from Windsor to receive Nelson's body. In some ways the story has been twice told; for Michelangelo's tomb for Pope Julius II. underwent similar but more grievous vicissitudes.

It would be too long a tale to give a list of the famous people buried in Old St. Paul's, or even of those who rest within the present cathedral. Besides, the object of this sketch being architectural rather than historical, it is our intention to glance merely at the tombs or monuments which interest us as artists; maybe also to touch upon those which reflect discredit on us, in the hope that the movement which is working towards a higher standard in almost all branches of art may reach to this, not its least manifestation. There are a few fragments of sculpture left from the old monuments, interesting merely as showing the older fashion of adorning these things—fragments of recumbent effigies of men in armour and women in the dress of the time, and the like. The mutilated seated figure of a woman, probably the wife of John Wolley, is interesting; but the best and only complete one—now set up in the south choir aisle—is the statue of Dean Donne, made in 1631 by Nicholas Stone. When Donne lay near to death he was persuaded by his friend and physician, Dr. Fox, to have a monument made for him. "A monument being resolved upon, Dr. Donne sent for a carver to make for him in wood the figure of an urn, giving him directions for the compass and height of it, and to bring with it a board of the just height of his body. These being got, then, without delay, a choice painter was got to be in readiness to draw his picture, which was taken as followeth:—Several charcoal fires being first made in his large study, he brought with him into that place his winding-sheet in his hand, and, having put off all his clothes, had this sheet put on him, and so tied with knots at his head and feet, and his hands so placed as dead bodies are usually fitted to be shrouded and put into their coffin or grave. Upon this urn he thus stood, with his eyes shut, and with so much of the sheet turned aside as might show his lean, pale, and death-like face. . . . In this posture he was drawn at his just height; and when the picture was fully finished he caused it to be set by his bedside, where it continued and became his hourly object till his death, and was then given to his dearest friend and executor, Dr. Henry King, then Chief Residentary of St. Paul's, who caused him to be thus carved in one entire piece of white marble, and it now stands in that church."

Unfortunately, few men have such a curious biographer as Isaac Walton, and we lack information on this as on many other points. But perhaps few men care to contemplate their dissolution and to provide for it. We always hope Dr. Johnson was of this mind. For

certainly he would not be gratified by the Herculean figure (1784) standing on the left hand of the choir which is supposed to be a representation of him.

The monuments in St. Paul's offer a sorry picture of the state of sculpture from the last years of the XVIIIth century until Stevens came to fill in a new and brighter canvas. Flaxman is represented by several works, the earliest of which is a statue of Sir Joshua Reynolds (1792), in a standing position, with his right arm against his breast, the hand holding a book ("The Discourses"), whilst his left falls straight from his shoulder with outstretched fingers touching a truncated pillar, on which is a portrait medallion of Michelangelo. The whole conception is heavy. What contrast to the joy and suavity of the work of the painter it is supposed to commemorate! The other works of the sculptor are more elaborate. The monuments to Howe and Nelson consist of pseudo-classical figures and ornaments with the heroes, the ostensible object of commemoration, in contemporary dress appearing so strange and out of place. The statue of Nelson is happier in being placed above the other figures; Howe's monument, being on the same level, suffers in comparison—even with the figures taken from Homer. Yet some of the classical figures are not without grace if we consider them separately; the drapery hangs in folds reminiscent of Attic work, but as a rule they are the figures of Flaxman's illustrations to Pope's translation of the *Iliad*.

How dead, how insufferably dull is most of the work placed in the niches around the Cathedral! A merciful oblivion has overtaken the manifold authorities whose names, meaning no more than the advertising name cut on the corner of a tombstone—Banks, Lough, Belmeade, Westmacott, and the rest of that company—are fit only to figure in a new *Dunciad*. What shall we say of Marochetti's monument to William and Frederick Viscount Melbourne (1846-53)? A new element introduced into the sculpture of the tomb—to wit, the sentimental. An archway fashioned in black marble with a noble inscription carved in gilt letters upon a frieze above it, and on each side is a white marble angel clothed in a long gown. They both bend their heads towards the centre of the tomb with very mournful countenances, but they do not inspire grief. Indeed, the angels are nothing more than a sentimental abstraction of Victorian ideals.

The more modern work would seem to be based on the older fashion of Nicholas Stone, in which recumbent figures take the most important place. Three similar monuments in the south choir aisle—Dean Milman, by Williamson (1863), Bishop Blomfield, by Richmond (1857), Bishop Jackson, by Woolner (1884)—all of the same type, in which effigies rest on a square box or sarcophagus. It seems to us that these sculptors all have paid too much attention to details, to the embroidery of the draperies, to the pattern of boots, to jewellery, and such like instead of trying to realise the fact to which the tomb owes its existence. If we pronounce the sculpture indifferent, what shall we say of the architecture setting?

Although we cannot say that Mr. Brynecroft has managed to escape the detail, he has given the figure of Adell Creighton, Bishop of London, the verisimilitude with life; the head, in fact, is of great beauty and dignity, which makes us regret the more the inadequacy of the architectural setting.

There are a few wall panels of fair merit in the upper church—to Charles Robert Kerrell, Sir Arthur Sullivan, Sir John Mer. The first is best in design, but they are all three good examples of the manner of the early XXth century. There are a great many more in the apt, inferior to these, as a rule; but, on the other hand, there are two most beautiful things from the hand of Gilbert a memory of Randolph Caldecott (1866) and Frank Holl (1888). The latter consists of a bust set in a kind of circular pediment; while the former represents the figure of a boy placed in a little niche, the top of which is supported on fanciful pillars. These take away from the mediocrity of the rest, and are a sufficient excuse for the tournalement of this art.

There are several good wall tombs dating from the beginning of the XVIIIth century, executed with characteristic carving, flowers and fruit and the heads of youthful angels. The modern ones, however, are not pleasant to contemplate, they are too florid, too commercial, and make an incongruous note in the still quietness of the crypt. It should not be forgotten, however, that there are carvings of price to be found in the dimly-lit corners. Take, for example, the beautiful bust of Henley the poet. That, again, is excuse, if such were needed, for the encouragement of the makers of tombs and statues. With less encouragement the best might be lost.

THE NEW DELHI.

WE are glad to see how widespread an interest has been aroused in the question of the style to be adopted in the new capital of India, and we publish elsewhere in this issue an article on the Mogul architecture of Agra, with illustrations which give an idea of the salient features of the traditional work in the district round Delhi. The *Manchester Guardian* gives in an article the advantages of working in an indigenous style, and in a letter to the *Times* of the 11th inst. Mr. G. Jackson, R.A., adds a thoughtful and well-written contribution to the subject. Mr. Jackson very rightly says, "Our best artistic suggestions in design come from necessities of construction and considerations of utility," and "we could study works of art, not to copy them, but to be impregnated with their principles; and if our study has done its work we should be so saturated with the true principles, not of this or that particular style, but that of architecture itself, which is a very different matter, as to be ready for any novel conditions which may present themselves." When, however, he expresses a disappointment at Lord Curzon's dwelling on "the necessity of style," we find ourselves unable to follow his reasoning.

Style seems to us to be to architecture what language is to speech—the only possible means by which we can express ourselves, and failing a universal language it is necessary to express our meaning in some particular one. So with architecture, the earliest efforts of man are marked with "style" in greater or less degree, and only the dwellings of our pre-historic ancestors—the cave-dwellers—can be held to be devoid of style, and these we hardly characterise as architecture. But the language by which a man can best express his meaning is usually his own, and the style in which it is most natural to express oneself is that with which one is most familiar. With the brief exceptions of periods of "revival," our natural means of expression is through the current European tradition of civilised Europe—in other words, the classic Renaissance. Nor is there the slightest reason why we should not express India's wants and necessities in such a manner. The Romans built alike in this country and in Syria, but in the latter they employed arched and colonnaded streets, because they were needed for climatic reasons; but in both England and Syria the Roman left the marks of his presence in the architecture of the country as on every other phase of its life. The illustrations of Mogul architecture we give are, we think, convincing proof both of the beauties of the style and its unsuitability for the expression of the modern wants of civilised India, but we feel that in some phase of the Renaissance there is ample scope for employing native craftsmen and giving them opportunities to show their skill in devising and carrying out beautiful detail which, after all, constitutes a great part of that excellence which we admire in Mogul art.

We consider that in harking back to compromises and in any attempt to carry out modern buildings in the style which characterises the Mohammedan buildings of India we should but be adding another futile "revival" to its predecessors instead of emulating the spirit which alone has made great architectural epochs possible.

NOTES.

OUR leader this week should set many thinking. Who that has stood beside the statue of Brunelleschi gazing at his lifework from beneath the shadow of the beautiful dome he reared, has not been moved to venerate not only the handiwork of the man but the man himself. It is true that the domes of Florence, of Rome, and of London, to mention only three Renaissance masterpieces, stand as monuments to the memory of the genius which fathered them, but how often does it happen that the "man in the street," who consciously or unconsciously raises his eyes to them, knows anything about the master-mind behind it all? More likely than not he is ignorant of so much as the architect's name. To thousands of Londoners the name of Sir Christopher Wren doubtless conveyed nothing when they saw it on one of the London County Council steamboats, but

it was a happy idea to christen these boats—short-lived though their plying on the Thames—with names of men who had played the greater part in building up England's fame and London's beauty. And now there is nothing to keep the name of Wren before the eyes of the world, and to remind us that he lived and moved in our midst—in fact, that he was a human being. His work is becoming more and more a precious heritage, and he and certain others since his time are worthy to be commemorated by the finest statues in our public places that the sculptor's art can shape. We say this with full knowledge of the many inartistic statues scattered about England, deposited without forethought as they are and conceived without beauty. We do not forget some of the ugly and vulgar monuments to late kings and queens, as well as the statues on the exterior of a large new building erected to be the home of Art. In spite of the bitter irony of such proceedings we still desire to see more statues. We suggest even the formation of a society to fill all the empty niches in London with statues. And we do this because we think highly of the art of sculpture and know that it can be well done if Committees and others who have the giving of commissions place them with discrimination.

It was a good idea of the Library Committee of the City Corporation to arrange for the exhibition from time to time of selections from the important collection of prints and drawings in the Guildhall Library. We might only wish that the Committee had at their disposal more adequate and convenient space for such exhibitions than is provided by the corridor leading to the library. Perhaps this will be possible when the scheme for the new art gallery is carried into effect. The small exhibition which was opened last week is confined to engravings and drawings of the Thames, which go to show the great changes which have been effected on the banks of the river from Westminster to the Tower since early in the XVIIIth century. Even within the last hundred years, prior to the building of the present Houses of Parliament, the neighbourhood of the river about Westminster presented a comparatively rural aspect. But the interest of the exhibition is artistic as well as topographical; it contains some excellent specimens of aquatint engraving, as well as original water-colour drawings, including examples by Valentine Smith and Francis Jukes. The work of William Marlow is represented by original drawings depicting the demolition of the old and the erection of the new London Bridge, and there are other views engraved after the work of J. Gendall and William Daniell. We had, however, some difficulty in viewing the collection on the day that we visited it, in consequence of the corridor being largely occupied by pieces of timber which had been employed in some civic ceremony, which supplied sufficient evidence of the necessity for better accommodation for these interesting exhibitions.

Old Views of the Thames at the Guildhall Library.

Buckingham Palace. THE last, and perhaps the most-needed item of the series of improvements connected with the Queen Victoria Memorial, is to be effected by refronting Buckingham Palace with a new stone façade, and, as was natural, this important work has been placed in the hands of Sir Aston Webb, R.A., whose designs have now been approved by the Executive Committee. It will be remembered that Sir Aston Webb's design for the Mall improvement was placed first in the limited competition held as far back as 1901. The new front, we learn, will cost about 60,000*l.*, which will be defrayed out of the Memorial funds, and the contract for rebuilding has been given to Messrs. Leslie & Co.

Land Registration. IN a return recently published of the work of the Land Registry it is stated that from the time that registration was compulsorily applied in the London area, January 1, 1899, 151,951 separate properties have been entered on the register. It will be remembered that it is only compulsory to register "possessory" titles, although the object of the legislation is to secure the registration of absolute titles. So long as registration is compulsory it certainly is of advantage where possible to register absolute title. In a note to the Report it is stated that, where absolute title has been offered to be registered free of additional expense, in many cases the offer has been refused without any adequate reason—a course which, the Report states, it is difficult to account for. Unpopularity of the system will hardly account for landowners adopting such a course, and there must be some reason why 500 out of 1,838 people should have refused to register their possessory titles as absolute. We can suggest no cause, but possibly, although the Registry requires no further fees, the registration may necessitate private costs being incurred by the parties. It would be interesting to have further information on this point.

NEW SEWERAGE SCHEME FOR SPALDING.

At a monthly meeting of the Spalding Urban Council the principal business was the consideration of a scheme for the better drainage of the town, the estimated cost being 20,000*l.* Plans, etc., had been prepared for this purpose, and were placed before the Council. The Surveyor (Mr. J. Bailey) said that the proposed system produced clear water in two hours, but their present system took eighteen hours. It was ultimately decided to adopt the proposed scheme, and to apply to the Local Government Board for sanction to borrow the required amount.

WAGES IN THE ENGINEERING TRADES.

At a joint Conference of allied engineering trades, held at Manchester on the 9th inst., it was agreed that the wages of members of the trade unions concerned be advanced 1*s.* in day wages and 2 per cent. in piece rates, the first pay on the advanced rate to be given in November; that a further advance of 1*s.* per week in day rates, and 2½ per cent. in piece rates be given two months later; that the wages of the members of trade unions who are signatories to the agreement remain unaltered from the date of the last advance for a period of three years, any change to be subject to three months' notice on either side. This recommendation will be submitted to the respective societies. Between twelve and thirteen thousand workmen are concerned.

ANNUAL GENERAL MEETING.

The opening meeting of session 1912-13 of the Architectural Association was held on Monday at No. 18, Tufnell-street, Westminster, S.W., Mr. Gerald C. Horeley, President, in the chair.

The minutes of the last meeting were read and confirmed, and forty-three nominations were read.

Mr. Hall, Hon. Secretary, announced that the next meeting of the Camera, Sketch, and Debate Club will be held on October 24 at 8 p.m., when a paper, entitled "Craftsmanship and Architecture," will be read by Mr. L. M. Phillips.

The President announced that the Hon. Librarianship is vacant, and that there is one vacancy on the Council. Nominations for the same may be made at the next meeting. He also proposed a vote of thanks to Mr. Edwin Gunn for presenting a collection of about 200 negatives to the Association. This was heartily agreed to.

The President then distributed the prizes and medals for session 1911-12, the following being the list of awards:—

R. M. Pigott—A.A. Silver Medal.
W. O. Rees—Banister Fletcher Bursary.
E. J. Higgins—Architectural Union Company's Prize.
W. G. Newton A.A. Essay Prize and Silver Medal.
W. S. George—Herbert Batford Prize.
A.A. Travelling Studentship First Prize not awarded.
B. W. Ridley—Second Prize, A.A. Travelling Studentship.
M. T. Waterhouse—History, First Year Day School; equal with A. S. Furner in Studio Prize.
A. S. Furner—Construction, First Year Day School; Freehand Drawing, First Year Day School; equal with M. T. Waterhouse in Studio Prize.
H. J. H. Dicksee—Travelling Studentship, Second Year Day School.
H. G. Satchell—Special Prize given by Headmaster, Second Year Day School.
E. C. Davies—End of Session Test, Second Year; Prize given by President.
H. A. N. Medd—Book Prize, First Year Evening School.
F. W. Mackenzie—Second Prize, First Year Evening School.
J. B. M. Walsh—Scholarship, Second Year; First Place in Materials; First Place in History.
B. K. Smith—Book Prize, Second Year Evening School.
D. J. Gordon and T. W. Dowsett—Equal, Third Year Evening School Prize.
A. T. Hardman—Travelling Studentship, Fourth Year Evening School.
T. F. Ford—Second Prize, Fourth Year Evening School; First Place in History.
T. F. H. White—First Place in History.

The following students have been awarded the Association's Two Years' Course Certificate:—

E. C. Davies.	H. G. Tebbutt.
H. J. H. Dicksee.	R. S. Wallace.
J. S. Hodges.	W. W. Locke.
H. G. Satchell.	A. F. Hooper.

President's Address.

The President then delivered the following address: "On the Training Afforded by the Architectural Association and Its Value in Promoting the Progress of Knowledge in Architecture."

"LADIES AND GENTLEMEN, On rising to address you, as is the custom of Presidents at the opening meetings of the sessions, I feel I should offer you some sort of apology

for troubling you again in this capacity. Your suffrages, as I believe they are called, have placed me in the position of your President for a second year, so I may fairly claim that you are yourselves responsible; but, too, am not quite guiltless, for when I was asked if I would serve again I did not say no. I can only hope that the experience gained in my first year of office may help me in my second, so that you may not be too badly disappointed. To us all the business of the Association is of paramount importance. Last year in my address I traced in some detail, the progressive work of the Association from its early days, when its membership consisted of its founders, through the many years of voluntary work and effort in its schools and classes, up to the formation some time ago of its School of Architecture and its present membership of something about 1,700.

Founded over sixty years ago by a few earnest men to fill a blank in their artistic lives, our society has consistently advanced along the path of progress and development. It began as a society founded by architects for architects, to assist them in acquiring fuller and more complete knowledge of the art, and it is still, I am thankful to say, managed by architects for the same excellent object.

The Day School—Third Year.

This evening I will, with your permission, turn to a development in its work which I believe to be one of no little importance. This is the institution of a third year in the Day School course in the School of Architecture. Hitherto, as you all know, the three years spent in the Day School have been chiefly of use to the student as an admirable introduction to the art of architecture. They prepared the way for the more advanced study in the Evening School in the third and fourth years, where much excellent work has been done. In the future the first two years will still fulfil these preparatory functions, and in those cases where a student cannot attend a third year in the Day School will be able, as heretofore, to complete his course and obtain his certificate in the Evening School in his fourth year. But those students who take advantage of this new institution I believe that time will prove it to be of great benefit. First, because if good workers, they will be able to obtain their certificates in three years instead of four; and, secondly, because they will be far better equipped for the work which will fall to their share on entering, as pupils or assistants, an architect's office. Here I come to a very important reason for the institution of this new régime. The complaint has been not infrequently made in the past that the two years' course was a period of sufficient length properly to equip a man for work in an office; to meet this complaint the third year has been instituted. Under the able direction of Mr. Robert Atkinson the all-important subject of design will be carefully studied, and it is the firm opinion of the Council that the prolongation of the probationary period must prove to be of the utmost advantage to our Day School students.

Students and the Royal Academy School.

In common with every member I should deeply deplore this development if I felt it would have any deleterious effect upon the custom of entering an office as an articled pupil after the course has been completed and the certificate obtained. I do not believe that it will have this effect. We have made the Day School course a longer one in order that the student may be better fitted to enter an architect's office. This development was in my opinion, quite inevitable. In view of the careful preparation for his future work which it is now necessary to provide for architectural students, the period of study must be lengthened. In common, then, with the Council and with the Advisory Council who have been consulted upon this important step, we may all look forward with confidence and interest to its success; all the more because a still further development is closely connected with this three years' course. It is that the student should enter the Royal Academy School for training upon its termination and during the time he is at work in an architect's office. The authorities of the

Academy have agreed to admit to the School without the usual examination, except in the subject of design, any of our pupils who have obtained their certificates in the Day School course. Thus, by the thing given in this building, supplemented the teaching at the Royal Academy, we shall have a continuous scheme of architectural education of the best and most interesting kind. It may be urged by some of our members and supporters, "But why combination with the Royal Academy? Why does not the Association undertake this advanced training itself?" To the reply to this is, that in advising certificated students to enter the Schools of the Royal Academy for the completion of their studies we are availing ourselves of a successful educational organisation of that distinguished body. We are advising them only to enter a school whose traditions of work are of the very best, but a school trained in a milieu essentially and vitally artistic. To master the principles of his art in a congenial atmosphere is, for the student, a matter of the first importance. The artist's vitality, so well known to those who have passed through the course of training at the Royal Academy, is probably owing to the excellent system, whereby the instruction is given by architects and artists, who act as visitors to the classes, and partly to the broadening influence of fellowship with young sculptors and painters, an association which frequently leads to friendships of lifelong, and also of professional, value, and tends to the formation of what I may call artistic character. There will, of course, be in our own training School advanced training of a very rough and carefully-prepared type. The training School has always been a great treasure in our work, and it is to be continued and much improved. In its lectures will be given which will be of use to all who are preparing for the Final Examination of the Royal Institute of British Architects. The work will be of an advanced character, but it will be more adapted for those who are only able to spend two years at the Day School and for those who are away in London for a comparatively short time. Turning again to the advantages offered to a student by the Royal Academy, I must point out that the prizes which can be gained for good work are of great value. The principal of them is, of course, the Gold Medal for Travelling Studentship for one year's study abroad, of the value of 200*l.*, which is awarded for competition every two years. Ever since its institution this prize has deservedly been the "blue ribbon" of the student's career. It is gratifying to read in the annual report of the Council for the past session, on page 216 of the new "Brown Book," that in the following prizes were won by members at the Royal Academy School, 1911-12:—The Gold Medal and Travelling Studentship (200*l.*), by Mr. Alan Bunning; First Prize of Architectural Drawings (First Prize 100*l.*), by Mr. W. L. Clark; an Architectural medal (Prize 20*l.* and Silver Medal), J. M. Hitehew; Set of Drawings of an Architectural Design (First Prize, 15*l.*, and Silver Medal), V. O. Rees; Second Prize (10*l.* and Bronze Medal), Cyril A. Farey. As this list includes nearly all the prizes open to architectural students in the Royal Academy you will, I am sure, join with me in heartily congratulating these successful competitors, and agree with me in thinking that it is apparent our School of Architecture has already made up its mind as to how it is intending to deal with this matter.

Studentships at the School at Rome.

But I should like to remind you here that the provision for the equipment of our architects of the future is not yet finished. As you all know, the foundation of studentships at the School at Rome is now an accomplished fact. No doubt the number of studentships compared with the number of competitors will be few, but, nevertheless, the institution of this important competition will tend to make our whole scheme of architectural education in this country more thorough, for, although all competitors cannot be winners of prizes, all may be inspired to do good work.

The Post of Registrar, etc.

I should also like to mention that, in order to increase the efficient working of our educational system, we have created a new post, viz., that of the Registrar. The Registrar may be called the Secretary of the School, and I believe that Mr. Scott-Holmes, who has been appointed to fill this position, brings to it just those qualities which are desired. I am glad, on this the first public occasion since the appointment has been made, to give Mr. Scott-Holmes a very hearty welcome on behalf of the Association. We have also in the last few months made some alterations in our building, which, we hope, will add to the comfort of our members. I refer particularly to the new members' room on the first floor and the redecoration of our meeting-room.

I regret that time will not permit me to speak to-night in any detailed manner of the many interests of the Association; for instance, of the meetings, the excursions abroad and at home, the "Sketch Book," the Camera, Sketch, and Debate Club, the Athletic Club, and others. I must refer you to the "Brown Book" for information about these. I will merely remark that we are looking forward to a year of much activity in all these matters.

The New Secretary, and the New Insurance Society.

But I will call your attention to two events which are recent and of interest to us all. The first is the appointment of our new Secretary, Mr. Yerbury. The Council and those members of the Association who know Mr. Yerbury, and the hard and good work he has done for the A.A. in past years, view this appointment with satisfaction. I feel I may say that he has the best wishes not only of our own members, but of the profession in general on his new appointment.

The second event to which I wish to draw your attention is important not only to some of our younger members, but to the many assistants and workers whom we find in architects' offices throughout the country. I allude to the new Insurance Society, which has been formed under the National Health Insurance Act, and which is called the Architects' and Surveyors' Approved Society. This Society has been created under the auspices of our Association in conjunction with the Royal Institute of British Architects, the Surveyors' Institution, and the Society of Architects. It has made a most excellent start, for a large number of members have been enrolled already. It is not only appropriate that under the new conditions imposed by this Act of Parliament that those working in our profession and in the profession of the surveyors, and who come directly under these conditions, should have a society of their own, but also that the formation of it should have originated with the A.A., for in our ranks a large proportion of the future members will be found.

Of course, most of these members will only remain under the Act for a short time, but their contributions during that period will allow for a gradual accumulation of necessary funds, which will permit of the granting of useful benefits to those who may require them.

For the formation of this Society our thanks are due to several of our members and to our Secretary, Mr. Yerbury. These gentlemen have given generously of their time, and have worked hard during the last few months to ensure the success of the new Society; and it must be gratifying to them to see the successful beginning which has been made. For the present the office of the Society is in this building, and Mr. Yerbury has superintended the initial work. A general meeting will shortly be held, when doubtless further arrangements made necessary by its growth and expansion will be discussed.

The Late Secretary of the Association.

In considering the progress which the Association has made during the past year we cannot but pause for a moment to remember the sad loss which we suffered so very suddenly last autumn. I mean in the death of Mr. D. G. Driver, who for so many years had worked with so much energy and enthusiasm in the interests of our society as its Secretary. It will, I am sure, be of

interest to you all to know that the kind response to the appeal issued by our Hon. Treasurer has enabled our trustees to come forward and make such arrangements as will best help Mr. Driver's widow and young children. In the death also a few months ago of Mr. T. M. Rickman, F.S.A., we have lost our senior member and Past-President. Mr. Rickman was elected a member of the A.A. in the year 1852. He was therefore one of its founders, and was President in the year 1854-1855. To the last he took the utmost interest in the doings of the A.A., and only last year I had a letter from him in which he regretted his inability through illness to attend the first meeting of the session.

The Real Purpose of Our Efforts.

My reason for devoting, however inadequately, this paper chiefly to the work in the School of Architecture is twofold—first, to point out the new development of our system; secondly, to remind ourselves of the purpose underlying all our efforts, namely, to help forward the course of our art, and to hand on the torch, as M. Gaudet has said, to our successors.

In my address last year I emphasised the necessity of our education being based upon the principle that art is unity; in the words of Alfred Stevens, "I know but one art." I referred also to the wise provision made many years ago in France by the great Minister Colbert for the education of the artists of his country in Paris and in Rome. I ventured to state that it was this very thorough system of training which helped Labrousse to build his library of St. Genevieve in Paris and his notable additions to the Bibliothèque Nationale, which helped Duban in his building at the Beaux-Arts and Duc at the Palais de Justice.

I think we may claim for the continuous course of training, including the advanced course at the Royal Academy which the Association has now adopted and which I have described to you this evening, that not only is it founded on the principle of the unity of art, but that, through its conjunction with the opportunity for further study offered by the British School at Rome, we are instituting a "very thorough system of training" in this country.

The opportunities for architectural work in the future promise to be many. Cities will be rebuilt, and new cities, at home and abroad, will be needed. It seems to me that no thought can be more inspiring to a young architect than that of adding to the beauty and nobility of our Empire and to the health and happiness of its inhabitants. The study necessary to make us fit to take our proper part in this endeavour is so wide, so illuminating and interesting, and the aim of it is so high, that we may well believe our profession to be of the noblest—one of those to which a man is proud to belong. To it we must bring the best accomplishment, the best work that is in us, all our imagination, all our vitality, and a genuine enthusiasm."

Mr. Paul Waterhouse,

in proposing a vote of thanks, said it was a good thing that the President should have spoken on the subject of education, for it was astonishing how few people gave time to consider what was going on in education. People did not realise what a remarkable process education was. It had given him much pleasure to be external examiner to the Association, and he had been much struck with the work going on in the schools of the Association. It had been a revelation of what could be done in the course of three or four years—he was surprised in comparing what men did at the beginning with what they did at the end of the time. The result showed that the work was well done, and that there was a sympathy between teacher and taught, without which the progress would be slower. The President had touched on a very interesting subject in dealing with the relation of pupillage to the education which was given in the Association, and he hoped with him that pupillage, or some substitute for it, would never be abolished. It was well to remind them what the generation behind him (the speaker) had done. They did a rather fine thing in setting architectural education going in the way they did, for up to that time teaching in architecture was practically confined to offices of men in practice, by means

The Moti Masjid (Pearl Mosque), Agra Fort. (See p. 434.)

of pupilage, which brought some grist to the architectural mill—in fact, it was profitable, in a way, to an architect in practice to have pupils, but the architects of that generation did not let that stand in the way of young men being better educated and educated better than their principals. They then set themselves to start what had threatened to be a serious rival to the old-fashioned system of pupilage. Whether that old-fashioned system continued or not was not of very great consequence to the future of architecture, but what was important was that, besides excellent academic education, there must be some arrangement by which young men should get in touch with architects in practice, whom they should regard as their fathers in art, and he hoped that nothing in modern methods of architectural education would interfere with that. Mr. Waterhouse then made feeling reference to the death of the late Mr. Driver and of Mr. T. M. Rickman. Mr. Rickman was a very old friend of his, and might almost be regarded as the father of quantity surveying. But, apart from that, he was a very scholarly, interesting, and kindly man, and an excellent geologist. He greatly regretted his loss. Mr. Waterhouse also referred to the A.A. Essay prize awarded to Mr. W. G. Newton, and said he had seldom read a competition essay which was up to the

level of that which had won the prize. In conclusion, Mr. Waterhouse said he joined with the President in hopes for the future of the Association, and thought that that future appeared very bright. He hoped that the A.A. students in the near future would make their mark in the direction indicated by the President.

Mr. W. Curtis Green

said they all looked forward to that meeting more than to any other, and he wondered whether they should not do better to hold it at the end of the session, when they had earned it, rather than now, with their work lying all before them. They might then, on the wave of enthusiasm caused by the President's address, enlist men like the last speaker in the service of their affairs for the coming session. They wanted men pre-occupied with architecture as a living thing. They often thought their art unfitted them for routine affairs, but he felt sure that the Architectural Association would do this art as much good as they would do the Architectural Association. For, after all, architecture was concerned with the facts of life; they had only to read the history of Greece to be convinced of this. The President's address usually fell into two headings—the activities of the Association and the source

of inspiration or driving power of the student of architecture. Important as their domestic affairs were, that which interested them most was the force behind them. Once a year the President gave a glimpse of the vitality which endowed these activities with health and made for progress. This year he had given them a full account of the new third-year course in the Day School and of the bond between this School and that of the Royal Academy. Educational matters moved so slowly that the more they could unite and concentrate their efforts the further they would advance. He supposed that the little rivalries between the schools were but healthy signs of keenness, and yet he confessed a hope that they might see one great school of architecture for London. Meanwhile, the immediate concern was their own School. Under Mr. Maule's guidance it had for a long time been the most considerable school in the country, and the third year's course would still further strengthen it. The men that were passing on out of the School were also a source of strength to it. It was perhaps as well that it was only as they grew further advanced that they realised the nature of their adventure. Material things pressed upon them; efficiency and technique were hard to acquire; examinations overshadowed them. Yet those who looked for and learnt only the facts and formulae likely to be used in examinations, or in what was called professional practice, though they might advance themselves, would hardly forward the architecture of their time. It was not the fashion just now for our young men to dream dreams, or our old men to see visions; nevertheless, it was the imaginative outlook that mattered more than all else. Emerson said somewhere that the most surprising thing about a work of genius was that we recognised in it our own rejected thoughts; they came back to us with a certain alienated majesty, and he said that we must learn to detect and watch the gleam of light which flashed across our mind and not dismiss it because it was our own. For, if we thought of it, the justification for our existence as architects was that we produced beauty out of things in themselves commonplace, at the lowest order out of chaos. Those who did this had gathered facts and mastered the principles; they were so spiritually poised that they could place their facts, or arrange their units, each in its appointed and inevitable place, with the result that they produced works of art. He (the speaker) wished to refer to the debt that the Association owed to two of its members during the past year. The first, of course, was their President, whose never-failing tact

An Angle of the Fort, Agra.

The Tomb of I'timadu-daulah, Agra. (See p. 435.)

and engaging courtesy, together with a certain valuable wait-a-bit wisdom, had endeared himself to all of them. He had been the blithed corner-stone against which the bawry and headstrong had run without injury to themselves or the Association. The other man was their own Honorary Secretary, whom they were indebted for an unusually strenuous year's work. Mr. Hall had carried their affairs through difficult times with a certainty and ease which promised well for the future of the A.A.

Mr. W. H. Seth-Smith,
in supporting the vote of thanks for an impressive address, said that many of them had felt for some time that what was wanted was an advanced course which would approximate to the admirable system which obtained in France. The address had been largely devoted to the establishment of that advanced course, and he thought they might well congratulate the Association upon the policy initiated, and upon the progress made in moving what had been a very just criticism of our system in England. In the course of a short time there had been two new deparments—viz., the third year course of the Association, and, secondly, the School at Rome, which gave promise of providing a scholarship which was almost equal to the great Prix de Rome of France. As to the third-year course of the Association, it was to be hoped that it would tend in the direction of more monumental work, and would supply what was a real need here, and would prepare men for making the best use of the R.A. training. He could not help feeling that it was a distinct advantage to men who could see their way to continue in the Association schools, and to go through the more advanced course, and, if the Council could see their way to develop the course in the Evening School, it would be a great advantage to the men who were there; that was the alternative to joining the Royal Academy Schools. The later remarks in the presidential address interested him very much, for they opened a vista of possibilities which lay before all young members of the profession. It was of considerable importance for men to feel that not only would private clients be employing their services, but that, given the right abilities, they might be called upon to design cities. In fact, there

were three new cities to be built now a Canadian City, Delhi, and the Australian capital—and the great question to be considered was the principle governing the design of these new cities. They had all been interested in the discussion taking place in the Press as to the style of the architecture of the new city of Delhi, but the letter which interested him most, and which appeared to him to sum up the whole situation, and to give the real kernel of the question, was that by Mr. T. G. Jackson in the *Times* of the 11th inst. His words should be written in gold on the frieze of the Association's studios.

Mr. Walter Cave congratulated the Association on having secured the services of their President for another year. He (the speaker) was extremely interested about the announcement of the Royal Academy Schools. When he (the

speaker) was their President, he tried to arrange the matter, but there were insuperable difficulties at the time, and he was very glad they had been overcome, for it was what he had always wished. He thought it was desirable that the final training of their men should be in the hands of practising architects, and he did not think there had ever been such opportunities offered to young men as now. The Association Schools had good masters, and the work turned out showed greater and greater distinction, and that was what they should aim at, and then they would be able to earn the same tribute which was paid to Wren by Carlyle, who, having passed Greenwich Hospital again and again and not seeing it, one day had his eyes opened, and exclaimed: "That is the work of a great gentleman."

Mr. Arthur Keen said he yielded to no one in his sense of the importance and value of the work done in the Association Schools, for he believed it to be sound to the backbone, and carried out on the best educational lines. As to the general work of the Association, it was important that the educational work should not destroy the other interesting work which the Association had shown itself capable of. One thing he considered of very great importance, and that was that every opportunity should be given to men to get into close touch with one another in order that their work and abilities might become known to men who, later on, might be in a position to help them in life, and the value of an Association like theirs was especially felt in that way. The stimulus of acquaintances formed by association with other men engaged in the same occupation was very great, and in many ways mutual help was afforded.

Mr. H. D. Searles-Wood said he believed he was the oldest member of the Association present, and was very glad to be able to join in the congratulations to the President. He always believed in new blood for the Association, and while the prizes were being distributed he had been much struck by seeing the sons of old members coming forward to take their rewards. The Association ought to be run by the young men of the profession, and that was evidently what was being done and it must have been a great pleasure to the many

A Look-out Tower, Fathepur-Sikri.

The "Panch Mahal," Fatehpur-Sikri.

old A.A. men present to see their sons coming forward to receive prizes which, it might be, they themselves took in former years. He hoped this would always be the case, and, if it was, there would be no question about the future of the Association.

The vote of thanks, having been put to the meeting, was heartily carried, and Mr. Horsley briefly replied.

The President announced that the next meeting will be held on October 23, when a paper by Mr. Lawrence Weaver, F.S.A., Hon. A.R.I.B.A., entitled "Small Country Houses of To-day," will be read, and the Council's report and balance-sheet for session 1911-12 will be adopted. (Combined meeting with the Camera, Sketch, and Debate Club.)

Future Meetings.

The following is the syllabus of meetings following the meeting on October 23:

November 11.—"Marbles used in Greek, Roman, and Byzantine Buildings." Mr. J. A. Marshall.

November 21.—"Conversazione at 8 p.m."

November 25.—"The Prosaic in Architecture." Mr. Horace Cubitt, A.R.I.B.A., P.A.S.I.

December 9.—Joint meeting with the Art Workers' Guild. Subject to be announced. 1913.

January 13.—"Subject to be announced. Professor W. R. Colton, A.R.A."

January 27.—"The Architecture of Dublin." Mr. R. Caulfeild Orpen, B.A., F.R.I.B.A.

February 10.—"Subject to be announced. Professor W. R. Lethaby, F.R.I.B.A."

February 24.—"A.A. Excursion to Shrewsbury and District, 1912." Mr. Edwin Gunn, A.R.I.B.A.

* Combined Meeting with the Camera, Sketch, and Debate Club.

THE MOGUL ARCHITECTURE OF AGRA.

At a time when the question of the style for the new buildings of the capital at Delhi is being discussed, it is well to draw attention to the traditional work of the district, especially as in some quarters it is being urged that the Hindu lintol together with

they undoubtedly are, as are the later buildings of the Mohammedan invaders. These latter represent more closely the life of the people who built them, the buildings still left to us of the other styles being mostly temples. The daily life of the Great Mogul can be with facility revisualised from a visit to the palaces at Agra, Delhi, and Lahore. There he can be pictured, as some writer has aptly remarked, "in his dressing-gown and slippers."

The two great cities of northern India which are most famous for their Mogul architecture are Agra and Delhi; Amber, Multan, and Lahore are also remarkable for their Mohammedan buildings, but to Agra and Delhi, the former capitals of the Empire, the lover of Mogul architecture will primarily turn his attention.

Agra, the first capital of the great Emperor of India, Jallaludin Muhammed Akbar, contemporary of our own Elizabeth, is one of the most fascinating cities of the East. Its prime saw the golden age of Mohammedan rule in India; the rout of enemy after enemy, marriage alliances made by the Royal House with the great princes of Hindustan, and the Emperor's magnanimous spirit of religious tolerance.

His legal and army reforms, his revenue assessments were unparalleled in the history of India, and his methods of administration, both social and political, were only imitated by our own countrymen several centuries later. Small wonder, then, that the arts and architecture flourished. As is seen in the buildings of the Great Emperor, Mogul architecture is the successful blending of the ancient Hindu style with that of the imported Persian. Akbar's son, Jahangir,

The Pigeon House and Hathi-Pol Gate, Fatehpur-Sikri.

the Mohammedan dome and arch forms should figure among the principal features of the new buildings.

The mind of the architectural world naturally turns to the former architecture of the country. Its more ancient Hindu and Buddhist monuments are not perhaps so full of interest to the architect, unique and magnificent in their way as

The Mosque, Courtyard, and Salim Chisti's Tomb, Fatehpur-Sikri.

little, compared with his father, in the way of setting up buildings, and it is to Shah and Shah Jehan, his grandson, whose passion for building was limitless, that India owes her most exquisite specimens of architecture.

Aurangzeb, the next Emperor, reached his throne by murder after murder, and, though a great ruler, he was of a fanatic disposition, and the Empire, under the rigid intolerance he practised, speedily broke up. The decline of the Mogul style of architecture set in likewise, and after his reign there is little found that commends itself to notice.

The Fort at Agra, begun by Akbar in 1566, and completed by Shah Jehan in the middle of the XVIIth century, affords an excellent example in which the various periods of Mogul architecture—which may be divided into early, middle, and late—can be studied. The simplicity and solidity of Akbar's early work, gradually coming more refined and decorative in the reign of his son Jahangir, and finally culminating in the almost feminine daintiness of the work of Shah Jehan, can be compared side by side in the Fort at Agra. The Pearl Mosque, whose three bulbous domes rest above it with an airy lightness, is indeed a "pearl" among the buildings of the world; it is built entirely of spotless marble (p. 432). We pass through halls of audience, now void of their throng of gaily-decked courtiers, and no longer echoing to the tramp of mailed soldiery, and suite after suite of private apartments, through shady gardens, the courtyards of the spoiled favourites of the harem, balconies that gave it on to the *fausse braye*, wherein the Royal elephants did battle for the amusement of their sovereign, until we reach the

octagonal tower, or Musamman Burj, formerly the boudoir of the Chief Sultana, a dainty gem in the crown of Mogul architecture. There are cool underground chambers wherein the scorching heat and glare of an Agra summer would not be felt, baths, and sleeping pavilions on the roof, in fact all the appurtenances of a luxurious

and gardens of the great statesmen of the court, some of which are still standing. It was usual for the owners to be buried in their former gardens, and the mausoleum of Mirza Ghyas Beg, I'timadu-daulah, situated in his old garden, is well known to all visitors to northern India. He was father-in-law of the Emperor and a powerful man at court. We reproduce a general view of this mausoleum (p. 433). On the other side of the river lies the Chattri of Rajah Jaswant Singh, a great Rathor Rajput who suffered much at the hands of Aurangzeb.

Baber's garden, perhaps the earliest Mogul garden in India, was also on the banks of the Jumna. Many of these pleasures have now, alas, given place to mills, waterworks, and the other necessities of modern civilisation, but here and there rise graceful kiosks—their cupolas, russet-tinged with the setting sun—eloquent reminders of a bygone Empire and the splendour of its court.

North-west from Agra ran the great Mogul road to Delhi and Lahore, marked by quaint milestones, its dusty route cheered at intervals by wells and caravanserais, wherein at night travellers could sleep without fear of molestation from robbers or wild animals. Some five miles from Agra along this road lies the mausoleum of the great Akbar, a truly fitting burying-place. "There is but one God, and Akbar is his Viceroy." Such was his first motto, and on his tomb is inscribed "Allahu Akbar," which can be read either as "God is Great" or as "Akbar is God." Unlike any other Mohammedan structure, it is indeed hard to tell whence came the idea for this building. Fergusson is of the opinion that a Buddhist monastery suggested it, and this is the most likely solution that has been yet offered.

The Tomb of Akbar, Sikandarab.

Eastern palace. The smallest details are not forgotten. The water outlets from the main reservoir, high up on the roof near the Emperor's sleeping chamber, are all marked with stone discs bearing the names of the rooms or channels to which they led, so that they could be turned on or off at will.

On either side of the river lay the houses

Akbar's Tomb, Sikandarab.

The Entrance to the Palace of Jodh-Bai.

Twenty-three miles from Agra lies Fatehpur-Sikri, whither, owing to the auspicious birth of his son Jahangir, Akbar transferred his capital from Agra. For a short time it was a scene of pomp and luxury, but he soon went back to Agra, probably owing to lack of water. To-day the buildings stand empty as they were abandoned and in excellent condition. The Panch Mahal, or five-storied palace, gives one a good idea of the richness of the architecture (p. 434). Its fifty-seven supporting pillars bear, each one of them, different ornamentation. Behind it can be seen the towering Buland Darwaza, the gate of victory erected by the Emperor to commemorate his conquests in Gujarat. Behind it lies the Mosque courtyard, and the white marble tomb of the patron saint of the place, Salim Chisti, in striking contrast to the colonnades of red sandstone which surround it.

The palace of the Royal Queen, Jodh-Bai, the Rajput princess who was the mother of Jahangir, ranks high among the Mogul buildings of India. A sketch of the entrance is reproduced on this page. The internal courtyard is simply treated, a feature being the deep, overhanging *Chajja*, or "Sun-shade," which, with the sun at meridian, shades more than half the wall beneath it.

The palace is singularly complete. There is a hospital with house for the resident surgeon, a pigeon-house, elephant and camel stables, a house for the master of the horse, wells, baths, and apartments for each of the Emperor's chief queens. The hall of private audience is of curious design. A central pillar supports a central sitting-place for the Emperor, while from it radiate galleries to sitting-places for each of his chief ministers. The walls, pillars, and brackets of the chief buildings are covered, yet not overloaded, with ornamentation, both floral and geometric, and in the house of the Turkish queen the dado is carved to represent a Himalayan wood scene, even birds and animals being represented, only to be mutilated in later years by the fanatical Aurangzeb, their representation being inconsistent with the tenets of Islam.

The road between Agra and Fatehpur-Sikri is the old Mogul one, and the old Mogul milestones, or *kos minars*, are still standing; but the vast throng of people, all the length of the road from Agra to Fatehpur-Sikri, which European travellers to the court of Akbar saw and recorded, has given place to the ubiquitous tourist doing Agra in two days and rushing out to the deserted city in a motor-car.

No drawing can do justice to that triumph of Mogul art, the Taj Mahal. The avenue of cypresses and the water in which its reflection falls, the reposeful garden, a fitting setting to the snowy marble of the platform and mausoleum, flanked at either side by contrasting groups of warm red sandstone, are all part of a monument whose purity of culture, delicacy of decoration, and faultlessness of proportion are unrivalled.

Erected by Shah Jehan, in memory of his

Queen, Arjumand Bano Begam, the Taj Mahal was eighteen years in building, and cost, roughly, two million pounds. The building possesses an individuality which makes it unlike any other architectural work. To the trained European eye, there is perhaps something about the Taj which is weak and luxurious, but, while admitting there is something of effeminacy and littleness in its design, there is that about the Taj which grows on the beholder the oftener it is seen.

From the level of the garden to the top of the dome the Taj is 243 ft. 6 in. in height. Its minarets are 137 ft. high.

The building to the west of the mausoleum is a mosque, that to the east being an exact counterpart of the other, but intended merely as a place of assembly for worshippers at the mosque or mausoleum. Of recent years much has been done to improve the gardens of the Taj. The central avenue, and in fact the whole garden, was, till some ten years ago, too closely planted, and vistas of the mausoleum were obscured. Judicious thinning out and planting with cypress-trees have greatly added to the beauty of the Taj garden.

LECTURES ON THE ARCHITECTURE OF THE RENAISSANCE IN FRANCE.

On Thursday, October 10, at 6 p.m., the first of the Carpenters' Company's course of lectures was delivered in the Botanical Theatre at University College, Gower-street. The Master of the Company was in the chair, and in introducing the Special Lecturer, who this year is Mr. W. Henry Ward, M.A., A.R.I.B.A., made some eulogistic remarks on Mr. Ward's recently-published book on the subject of the lectures. He remarked that it was a strange fact that

no work on this important branch of architectural history as a whole had previously appeared either in French or English, and that the work in question, which he predicted would long remain the standard authority, had laid architectural students under a great obligation.

The lecturer showed how architecture has at all periods been the reflection of the ideas and movements of its time, and how the intellectual awakening of the Renaissance, which marked the arrival of the European nations once more at a state of mind similar to that of ancient Greece and Rome, was inevitably accompanied by an architectural revolution substituting lateral expansion, horizontality, spaciousness, and clarity for upward striving, vertical emphasis and mystery, and how the tendency to return to antiquity as a source of inspiration was assisted by the national aspirations of Italy, the first seat of the movement. He traced the course of Renaissance architecture in its early phases in Tuscany and Upper Italy, the development of the advanced or Roman phase at the close of the XVth century under the auspices of the Papal Court occupied with the rebuilding of St. Peter's, and its subsequent career in the twin spheres of Paduanism and Barocco often intermingling.

The lecturer then, passing to France, alluded to the degradation of the country during the Hundred Years' War and the subsequent revival, accompanied by the increased power of the monarchy and middle classes and the depression of the Church and nobility. He described the character of contemporary French architecture as an exaggerated expression of a medievalism which had lost its inspiration, when the masons lost themselves in ingenuities of design and dexterities of execution and sculpture grew ultra-naturalistic, producing an architecture characterised by verticality and unrest. He pointed out, however, isolated attempts in the direction of repose, regularity of setting-out, and the abandonment of pointed forms. He then outlined the agencies which introduced the ideas of the Italian Renaissance into France, both then and later, such as the French invasions of Italy, Italian architects and craftsmen working in France, French architects studying in Italy, Italian rulers of France, the patronage of the French Court.

The lecture closed by a description of the planning and character of the various classes of buildings habitual in France at the time of the Renaissance—the "château" in the country, still retaining much of its fortified character, its towers and moat and spiral stairs, the "hôtel" modified to the conditions of town life, the halls of the Corporations and Municipalities, the humbler houses of the *bourgeoisie*; and the reason for the relative increase in importance of domestic architecture as compared to ecclesiastical was explained.

The lecture was illustrated by numerous slides.

The Chairman having expressed his interest in the lecture, the Provost of University College, Dr. J. Gregory Foster,

The Taj Mahal, Agra.

a few words outlined the policy of the London University in regard to architecture. The premises of the Architectural Department were, he said, being at present rebuilt on the designs of Professor F. M. Simpson by the generosity of a benefactor, and a new building would, it was hoped, be available for the opening of the next session, when the schools now carried on separately at University and King's Colleges would be amalgamated.

ARCHITECTURAL SOCIETIES.

The Royal Institute of the Architects of Ireland.

A Council meeting of this Institute was held at 10, South Frederick-street, Dublin, on Monday last week. The President, Mr. A. E. Murray, R.H.A., F.R.I.B.A., was in the chair. There were also present:—Messrs. L. O'Callaghan, R. Caulfield, J. H. Webb, F. G. Hicks, C. H. Ashworth, P. Sheridan, H. Allberry, Professor Scott, G. C. Miller, and C. A. Owen, Hon. Secretary. The minutes of the previous meetings were read and signed. A large amount of correspondence was dealt with, including letters from the Nottingham Architectural Society, the Master Builders' Association, the Surveyors' Institution re Insurance Act. Several names in connexion with the election of Hon. Secretary and Hon. Treasurer were considered by Council.

Glasgow Technical College Architectural Craftsmen's Society.

At the last meeting of the Glasgow Technical College Architectural Craftsmen's Society, Mr. A. F. Purdie, President, Mr. A. N. Aiterson, A.R.S.A., F.R.I.B.A., delivered a lecture on "Scottish Architecture, XVth to XVth Century." He referred to the usefulness of the study of architecture towards an understanding of the history and character of a nation. In the case of Scottish architecture, the influence of national life and thought, and at the same time of the close relationship with France, was not so evident as might have been expected. An analysis of the earlier history of Scotland together with a discrimination between Scottish architecture and architecture in Scotland, showed why this should be the case, and that in fact no approach to an indigenous style existed in the country until the XVth century. All building during the Middle Ages was towards one of two ends—ecclesiastical or military. He showed the emergence of a Scottish style in church building towards the close of this period, with special reference to the French characteristics displayed in it, as illustrated by such examples at Glasgow, Dunkeld, and Iona Cathedrals and the parish and collegiate churches of St. Monary's, St. John the Baptist, Perth, Rosslyn, etc. Interest was transferred from church to house building by the beginning of the XVth century in this country. In France and Scotland domestic architecture was a direct development from the military type of earlier days, while in England this was departed from in favour of the manor-houses. The Scottish house of the XVth to the XVIIth century was described; its origin traced to the Peel towers, with a description of that and the special features in plan and design which were grafted upon it, the crowsteps and corbelling, gables and turrets, with illustrations from several early examples, and many later variations of the XVth and early XVIIIth centuries. The Renaissance influence reached this country through France. The first evidences were in the Royal palaces of Stirling and Falkland under James V. It was slowly adopted in later work, till, with the union of the Crowns, the French influence was submerged in that of the English Palladian, as evidenced in the work of Kinross and the elder Adam, to disappear almost entirely in the following century.

Manchester Society of Architects: Presidential Address.

Mr. John Brooke, the newly-installed President of the Manchester Society of Architects, delivered his inaugural address at a meeting of the Society on the 9th inst. Town planning, he said, was admirable in its intention, but was beset with much difficulty in its practical development, and its progress must necessarily be slow, especially in connexion

with town improvement, owing to the great cost which it entailed and the disturbance of vested interests. The greatest difficulty would be the provision of houses for the artisan and labourer class. That difficulty arose through the limited rentals which they were able to pay and through the increasing cost of building. It would almost appear that this class of house would have to be provided by local authorities or by the aid of the State, for the individual could not build to produce the necessary return on the capital invested. He condemned the tendency of local authorities to employ members of their own staffs as architects of public buildings. It was a great hardship to the ordinary practitioner, and, moreover, he thought it could be shown that it was wasteful and that it led to humdrum methods. But he feared that the tendency would increase, notwithstanding the protests that had been made. The system of public competition for architectural designs, with the loss of both money and labour which it entailed, grew, and even for buildings which involved small expenditure it was not uncommon to find a hundred or more designs submitted, the total cost of producing which would probably approach to nearly the amount which was to be spent on the building. He knew no parallel to this waste of labour and money in any other profession or business. These public competitions resolved themselves into lotteries, mixed with a strong element of the gambling spirit, and only relieved from criminality by being a game of skill. They had also the drawback of being probably less profitable than most other forms of gambling. The only really equitable form of competition was the limited competition, where each competitor was paid a suitable honorarium.

Several important problems in the development of the city were now being considered. "There is the question," he continued, "of the settlement of the purpose to which the Piccadilly site shall be used, whether for a new art gallery and library or for commercial purposes. It is difficult at present to see what will be the ultimate decision. It will be regrettable if the claims of art and literature, as a necessary part of the intellectual welfare of the city, should be ignored. Commercialism should not override the claims of culture, and art and literature are a necessary part of city life. 'We cannot live by bread alone.' Combined with the question of the use of the old Infirmary site is the matter of providing Exchange accommodation. A satisfactory extension of the present Exchange does not seem very convincing, and the building of a new Exchange would probably be the best solution if the question of vested interest can be satisfactorily settled.

As a possible site for a new Exchange, I do not think sufficient consideration has been given to the site in close proximity to the present Exchange—namely, the plot of land bounded by Corporation-street on the west side, Cannon-street on the north side, and Market-street on the south, up to New Brown-street, or as far eastward as may be required for the purpose. This position is now covered by property of a more or less ruinous and derelict character, and the land might be obtained at a comparatively low price. It would be a most important and desirable city improvement, and would give every facility for the provision of north lights, for the sale of cotton and for the other requirements of an Exchange, and would have the great advantage of causing little disturbance to street traffic during construction, and also of not affecting seriously the marketable value of existing property, which a more distant removal of the Exchange would involve. But much consideration is still necessary before a practical conclusion of this matter can be arrived at, and I fear there will be much delay before any definite steps are taken."

A hearty vote of thanks to Mr. Brooke was accorded on the motion of Mr. Dunkerley, seconded by Mr. Ogden.

BOOK RECEIVED.

THE ANNUAL OF THE BRITISH SCHOOL AT ATHENS. (London: Macmillan & Co. 25s. net.)

BOOKS.

The Sculptures of the Parthenon. With an Introduction and Commentary by A. H. SMITH, M.A., Keeper of the Department of Greek and Roman Antiquities in the British Museum. (London: The British Museum. 1911.)

THIS exhaustive work was projected by the late Alexander Stuart Murray, formerly Keeper of the department over which Mr. Arthur Hamilton Smith now presides, and partly begun during his lifetime. Sir Cecil Smith, who succeeded Mr. Murray, widened the scheme, hitherto confined to the marbles in the British Museum, so that it now includes all accessible fragments of the Parthenon sculptures. In pursuance of this plan the numerous casts now to be seen in the Elgin Room from the parts which remain at Athens were acquired. This measure, however, did not yet render the collection complete. Much of the sculpture remains unmodelled—notably many of the metopes still in position in the Acropolis Museum. These parts have, however, been photographed, and the plates are reproductions of enlargements, very carefully executed. Dr. Camillo Praschniker, of the Austrian Archaeological Institute, has communicated his restorations and notes and photographs of the Acroteria. Mr. J. E. Platt, of the Royal College of Art, contributes his restoration of the Artemis and Aphrodite group on the east side of the frieze. So that the work is, as we indicated at the outset, exhaustive, in the literal meaning of the term, as regards all the extant portions of the Parthenon which may be termed sculpture. Of sculptures in the round, views both before and behind are given. The invaluable drawings of the Pedimental groups by Carrey (1874) are reproduced in Mr. A. H. Smith's Introduction, together with photographs of the whole building, reproductions of the plan and a drawing showing construction. Old cuts show the explosion (1687) and the former condition of the ruin (1766), all built around with Moslem domes and other humbler buildings. Drawings from vases illustrating analogous groups are adduced to help and guide conjecture with regard to the parts that have disappeared. Mr. Smith's account of the Panathenaic Procession and the Pediments, together with the varied theories advanced, is unimpeachably lucid, and avoids the dogmatism and consequent acrimony with which so many scholars frustrate the fruition of their labours. The smallest fragments are enumerated with a care illustrative of the spirit of modern archaeology that will put together what remains of a fallen statue as scientifically as does a zoologist the few scattered bones of an extinct animal. The portfolio contains ninety-two plates comprising more than 320 subjects, which, with the 133 illustrations in the text, make a collection that may be justly termed complete. The fragments are collated and catalogued with great care. The whole work is sold in a strong portfolio, the Introduction alone being bound.

Architecturally, and as regards the architectonic qualities of the Parthenon sculptures, pediments, metopes, and frieze, there remains perhaps little to be said for the present. Of such work each age will form its successive estimate. And practically all that remains to be discovered to enable a technical estimate to base itself on data virtually complete is the grouping of the centres of the pediments—the treatment, that is to say, of the supremely difficult, and in the Parthenon probably the supremely triumphant climax of the building, sculpturally, at either end.

Le Parthénon. Introduction par MAXIME COLLIGNON, Membre de l'Institut, Professeur à l'Université de Paris. Photographies de Frédéric Boissonnas et W. A. Mansell & Co. (Paris: Librairie Centrale d'Art et de l'Architecture, Ancienne Maison Morel, Ch. Eggmann, Succr., 106, Boulevard Saint-Germain.)

We believe we are right in saying that the first part of this work appeared in 1910, and, to the best of our knowledge, the whole is not yet published. The promised Introduction by M. Collignon is not yet to hand; and we gather that there are still more plates to come. For, although we have received 118 altogether, they are numbered up to 136. We conclude that there are to be 140-50 plates in all; but feel that we can delay some account, due to our readers, of so important a work no longer.

The British Museum publication on the

Parthenon sculptures (noticed above) is a work for archaeologists and sculptors principally, and of interest to architects only in a secondary degree. The production now under consideration, however, is intended primarily for architects. It is another recruit to the growing company of substantial portfolios of photographs illustrating one building, which the French houses produce so splendidly.

It opens with fine views of the Acropolis and a plan of the Parthenon (double plate), taken through the upper diameter of the columns and very carefully drawn, so that the inclination of each column is shown. Then come photographs of the building from every point of view. There are photographs of the curve of the stylobate and of the architrave; of drums of the columns as they lie on the ground showing the method of fitting and dovelling used; of the cornice, mutules, and guttae in detail. A drawing showing the columns, with a section through, and details of the entablature, all figured, concludes the first portion.

The second and third are devoted to the metopes and some of the pediment figures, with views of the ruined entablature from above, and other drawings. The fourth, fifth, and sixth, to the frieze (Carrey's drawings are shown) and what details—bronze dowels, for instance, and the pavement and foundations—had not found a place before. The editor was perhaps well advised in issuing samples from all parts of his comprehensive scheme with his first instalment, instead of leaving the full scope of his production to be revealed only with the last.

This portfolio is wonderful in many ways—whether one thinks of it as the complete graphic presentation of what remains of the most wonderful building ever raised or merely as a series of photographs of an exceedingly difficult subject. The enterprise and grasp of their problem shown by these responsible for the initiation and prosecution of the undertaking is of the degree to which words can hardly do justice. We can only hope and trust that it will meet with the material reward which it deserves. As to the skill and science of the photography, perhaps if we say, in all soberness that it is worthy of its subject we may convey some conception of the place it holds in our estimation.

Colour in the Home. By EDWARD J. DUVEN. With forty-four full-page illustrations, of which thirty-two are in colour. (London: George Allen & Co., Ltd. Price 2s. 6d.)

The name of Duvén has been for so long associated with decoration that we anticipated a more practical application of "Colour in the Home" than this handsome volume presents us with. The philosophy of taste and the philosophy of colour both have their interest, and the appeal they make to the author is evidently a strong one. But we are somewhat sceptical regarding their authority in practical affairs. Goethe's philosophical turn of mind led him into abysses of error upon the nature of colour, and what is correct and what is not in matters of taste is highly controversial. Science appears to be the last thing that will help us, except as Whistler used that term when he deplored "the taste of the tradesman" supplanting "the science of the artist." The artist "knows" as surely as the man of science, but the eye has not been brought into subjection so completely as the reasoning faculty, and his powers of carrying conviction are consequently limited. The author bases some of his colour schemes upon the colours displayed upon the wings of the butterfly. We believe this to be quite a sound adventure, and, though not entirely a new one, it might be more frequently undertaken than it is. But the display upon the moth's wing is more simple, and has always seemed to us more applicable still. The ranges of grey relieved by touches of primrose, or perhaps by one tiny spot of crimson, present harmonies that may prove a valuable incentive to the decorator, the more so that they are opaque in their texture. The book informs us how the leading lines of decoration may transform the proportions of a room, increase its apparent height or length, and render awkward features less noticeable. We learn something, too, about backgrounds for pictures, if not as much as we should wish to. We thought possibly we might find an authoritative opinion upon the

vexed question of crimson or green for the walls of our national galleries. Perhaps the finest effect as a background which we have seen was executed by a painter—a painter of easel pictures, not a decorator. The crimson was carefully painted with the gradations necessary to relieve it, that relief which is sought and not attained by the use of an embossed pattern upon the covering. But Mr. Duvén is, we are glad to note, "down upon" the practice of picking out mouldings, the common device, or we would rather say vice, of the so-called "decorator," and his warning against introducing blue into any colour scheme that is not going to be pursued to its utmost limits is also salutary. We remember that William Morris was also incisive in this particular, as he also was upon the uses to which yellow was put without proper regard to the material. Silk alone could, in his opinion, give to yellow its full value.

Although some readers may find the parallels between blue and the key of C and orange and the key of F rather beyond them, they will find interest in following the author amid other aspects offered by his subject.

GENERAL NEWS.

The Lord Mayor Elect.

On Saturday, October 12, the Lord Chancellor received Sir David Burnett in the Prince's Chamber, House of Lords, and there signified the King's approval of the citizens' choice. Sir David Burnett entered the Common Council in 1888; he was elected Alderman of Candlewick Ward in 1902, and in 1907-8 served as a Sheriff of the City. He is an auctioneer and surveyor, a principal of the firm of Messrs. Edwin Fox, Bousfield, Burnetts, & Baddeley, of Gresham-street, a Fellow of the Surveyors' Institution, one of the official surveyors to the Board of Trade, and surveyor to several public bodies and undertakings.

H.M.'s Office of Works.

The Secretaryship rendered vacant by the resignation, through ill-health, of the Hon. Sir Schomburg McDonnell, K.C.B., has been conferred upon Mr. Lionel Earle, C.B., C.M.G. Mr. Earle was born in 1866, and was educated at Marlborough, the Universities of Göttingen and Paris, and Merton College, Oxford. He was an Assistant Secretary to the Royal Commission, Paris Exhibition, 1898-1900, and acting second Secretary of Embassy, 1900; and in 1900-10 was Private Secretary, in turn, to the Lord Lieutenant of Ireland, Lord President of the Council (Earl of Crewe), and the Secretary of State for the Colonies (Earl of Crewe and L. Harcourt).

Thomas Pennant's Library.

It is stated that Lord Denbigh is about to dispose of the library and collections of Thomas Pennant, which are preserved at Downing Hall, and were acquired by the late Earl of Denbigh through his marriage to Pennant's great-granddaughter and heiress, Louisa, daughter of David Pennant, of Downing, Co. Flint. Downing Hall, near Holywell, was the birthplace and home of the famous antiquary and collector, who died in 1798. The library is rich in rare first editions and presentation copies, in addition to the several thousand volumes relating to antiquities, topography, and natural history, and a store of MSS. There are also some perfect specimens, recently identified, of cinerary urns of the Bronze Period.

Shakespeare Monument, Southwark Cathedral.

Mr. Henry McCarthy has designed and executed the memorial which will be unveiled on November 4. The design is that of a Gothic shrine in which is a life-sized alabaster figure of the poet, in a semi-recumbent attitude, the likeness being adopted from the Dorothea portrait. At the back of the effigy is a panel representing Old Southwark in relief, with a portion of (old) London Bridge, St. Saviour's, the Clink, and the Globe playhouse. Five armorial shields are carved upon the base of the monument.

Wallace Memorial, Elderslie.

The memorial to Wallace at his birthplace, which the London Rentfrewshire Association have erected in proximity to the "Wallace Yew" and "Wallace House," upon a site given by Mr. A. H. Speirs, of Elderslie House, is

in the form of a Cross-Mercat. The design by Messrs. John C. T. Murray & J. A. Minty, of Westminster, and formerly of Glasgow, presents many national symbols and emblems, amongst them being the sculpture of thistles around the base, the two-handed sword on the memorial shaft, the Scottish crown, and the coat-arms of the kings of Scotland and of Douglas and Bruce.

The Road Board.

During the months of July, August, and September, 1912, the Road Board, with the approval of the Treasury, have made advances amounting to 172,703L. from the Road Improvement Fund to County Councils and other highway authorities, as follows:—For road crust improvements, 136,724L.; for road widenings and improvement of curves and corners, 5,422L.; for road diversions, 407L.; for reconstruction and improvement of bridges, 19,000L.; for construction of new roads and bridges, 11,150L.

CORRESPONDENCE.

Cross Traffic.

SIR.—With reference to your "Note" in the issue of September 27 last on "Hyde Park Corner points," the subject generally, it is reckoned, is one of the most pressing in the solution of the traffic problem.

Some time after the Royal Commission reported, I made a suggestion to the authorities in regard to the "Bank" points. It was to the effect that a 50-ft. "one-way road" round a disc as a centre would probably serve in directing traffic sufficiently to dispense with holding up and the consequent intermittent blocks.

I learned afterwards that the suggestion was not original, and since then it has been illustrated in the Press. It has been proposed that it should be tried at Holborn circus, but nothing has come of it.

My object in writing you now is to suggest what appears to be an ideal spot for an experimental application, viz., Oxford circus. One hundred and seventy feet in diameter, it has pavements 15 ft. wide. If a temporary disc of flooring—say, 40 ft. or less in diameter—were placed in the centre of the circus, a circular roadway 50 ft. wide would be formed; so that with traffic "wheeling," as it would need to then, there would be sufficient width nominally for five streams and the vehicle standing.

Now, if the neighbourhood be examined (Oxford-street), where there is a cab-rank it will be found that where a vehicle stands opposite a shop the whole traffic is confined practically to a single line. Progress past a given point is thus slow, and slower with the single line blocked by slow-moving traffic. When held up at the points a long string is formed, and no progress is possible for some time.

Under the new conditions there would be no block at the points, as "slow" and "fast" traffic could proceed abreast and straight ahead without obstruction. There would also be room for the vehicle standing at the shop and for the one going athwart round the disc—that is, from Regent-street to Oxford-street or vice versa, through three-quarters of the circle.

It would be enlightening to hear any objections to what appears feasible enough, quite simple, and not expensive in application experimentally. O. B. I. T.

INTERCOMMUNICATION COLUMN.

Modern Stained Glass.

SIR.—In reply to your correspondent, Mr. E. A. Collett, some good examples of modern stained glass may be seen in some of the City churches—St. Paul's Cathedral, Westminster Abbey, and St. Margaret's, Westminster. Some smaller work, more nearly approaching the XVth-century glass in effect, is in the Lady Chapel of the Church of "The Holy Ghost and St. Stephen," Shepherd's Bush, and in the rose window over the high altar in the same church. Another good example is at Exton Church, Hampshire, a one-light window showing a unique treatment of "Lux Mundi."

HAROLD GRIFFITHS, A.R.I.B.A.

ILLUSTRATIONS.

The Church of St. Barnabas, Mitcham, Surrey.

THE church is to be erected for the district which is being worked by the City of London School Mission upon a site in Gorrington Park, Mitcham, secured some ten years ago, upon which a church hall has already been built at a cost of 3,000.

The site is square in shape, with roads on the sides, and the church is to be placed towards the southern boundary, a sufficient plot being retained for a future vicarage on the northern side. The church will consist of a nave with north and south aisles, and will be seating accommodation for 830 persons. The nave and chancel are of the same width and height, and there is no barrel arch. The internal length of the church is 135 ft. 6 in., and the width of the nave is 25 ft. 6 in. The walls of the aisles are tied up to nearly the height of the nave. The pointed ceiling of the nave and chancel will be of fibrous plaster, the ribs springing from stone springers, while the lower roofs of the aisles will be wood barrel vaulted, the beams and main timbers being of English oak. The eastern wall is buttressed internally, the buttresses being pierced at low floor level to form a passage behind the high altar from the vestries to sacristy, and again below the windows at a height of about 20 ft. from floor level. At the east end of the north aisle are the vestries with the heating chamber and fan-room below, and the organ loft is over the choir vestry. A morning chapel, convenient for small congregations, is at the east end of the south aisle. The font stands at the south-west and the pulpit at the north-east corner of the nave.

A high saddle-back, stone-roofed belfry is sited at the east end of the church, providing a full peal of eight bells. Externally the walls will be of purple-brown Crowborough tiles and stone, and the roof covered with red tiles.

Simplicity of design and high proportions have been relied upon to give a character of impressiveness, and much architectural detail has been avoided.

The architect is Mr. H. P. Burke Downing, R.I.B.A., of Westminster.

Stained-Glass Windows at Kharitoun Cathedral.

Six lights illustrated on one of our Plates from the designs of Miss Esplin, an artist well known for the decorative quality and hiftocratic character which distinguish her work, whether in an ecclesiastic or domestic setting. These windows have been recently bought and placed in position in the new London Memorial Cathedral, at Kharitoun—a noble modern building, the architect of which is Mr. R. Weir Schultz. The Cathedral was illustrated in our issue of September 11, 1909. These lancet lights, seven in number, measure 10 ft. high and 10½ in. wide, and they are disposed in a row across the chapel at a height of 10 ft. from the floor. Between them and the outside wall runs an ambulatory, 6 ft. wide, with openings to admit the light. There are, however, only six openings to the seven windows, the light in each case indirect—a device for keeping the church cool and offering no protection against dust storms from the desert. So intense is the Eastern light that a glass is found sufficient to give full value to the brilliancy of the glass, which is a varied scheme of strong primary colouring.

The subjects of the windows, as seen in the illustration, are, from left to right:—

1. *Abraham*, holding the sacrificial knife and the ram, round which cling the thorns of the thicket. The child Isaac carries the bundle of logs for the burnt offering.

2. *St. Paul*, a figure in rich purples, with a peculiar emblem of the sword and the scroll of the Epistles.

3. *St. Mark*, who, as first Bishop of Alexandria, is of local interest, and is shown in episcopal vestments of ruby and gold.

4. *Christ in Glory*—the centre light. A traditional figure, with the fingers of the right hand raised in benediction, and in the left the orb of Sovereignty, on which are the sun, moon, and stars. The gold mantle is enriched with the vine pattern ("I am the true vine").

5. *St. George*. This saint, who is of Eastern origin, was adopted by Richard Cour de Lion

on his crusade. He is held sacred among the native races of Egypt, and on that account his place on the English sovereign is of peculiar interest to them. The colouring of the window is mysterious. The green head, scarlet tongue, and white teeth of the dragon shine out from the indistinguishable coil of his scaly body, and the deep ruby of St. George's cross and special device of roses show up in bold relief on the white ground of the shield.

6. *St. Philip II.*, the Deacon, who, as it is recorded in the Acts of the Apostles, converted the Eunuch of Queen Candace of Ethiopia. He wears a deacon's vestment of white and gold, and carries a jewelled cross.

7. The final light, which it has not been possible to include on our Plate, is *Moses*, holding the Brazen Serpent of Healing and the Tables of the Law.

It has not been Miss Esplin's object to portray incident in these windows, it being rather her idea that in the restrained medium of stained glass the story can be better told and invested with fuller meaning by the use of symbols than by any pictorial effort.

Other windows by Miss Esplin, illustrated on this page, are those in the Church of St. John the Divine, Richmond-on-Thames. These, in keeping with their position on the south wall of the Lady Chapel, represent two aspects of the Madonna. In the first light the young Virgin, looking forward (Spei Fons Future), and clad in light blue, holds a crimson rose, the symbol of Christ. Behind her the lilies of her emblem rise into a shining cross, and a radiance comes

down from above. The contrasting light is the "Mater Dolorosa," dressed in sombre blacks and purples, and cherishing a bleeding heart. In this window the cross is the Cross of Christ encircled by the Crown of Thorns and nails of the Passion. These windows are part of a general scheme of decoration for the walls and ceiling of the Lady Chapel which Miss Esplin has in hand.

In the Parish Church of Spitalfields, a church famous as the masterpiece of Nicholas Hawksmoor, are to be seen decorations by Miss Esplin in the form of mural paintings, a window and chancel panels. The latter are in ivory-tinted gesso and gold, with emblematic devices in bold relief on a delicate background of rose pattern. The paintings, representing "Christ, the Good Shepherd," and "Moses," are executed in tempera on a gold background. The figures are over life-size, and are situated at a height of 40 ft., where Miss Esplin worked at them on a scaffold. Between them, on the same level, is the window.

There are wall paintings by Miss Esplin in St. Andrew's Church, Thornton Heath, and it will be recollected that her design of the "Nativity" as part of the scheme of mural decoration in the Lady Chapel of the new Church of St. Jude-on-the-Hill, Hampstead Garden Suburb, was selected in open competition at the recent exhibition at Crosby Hall. Examples of domestic decoration by Miss Esplin are roundels in stained glass illustrating subjects from Chaucer, Spencer, and Shakespeare, which are to be seen in a house overlooking the Clyde. By introducing a roundel into the head of each light it is possible to get a charming decorative effect without obscuring either the view or the light—an arrangement frequently favoured by the craftsmen of old, and one which might with advantage be more universally adopted to-day.

Baroque Architecture.

The illustrations of Venetian buildings are in connexion with the fifth article on "Baroque Architecture," which begins on p. 441.

MEETINGS.

SATURDAY, OCTOBER 19.

Institution of Municipal and County Engineers. North Wales district meeting at Wrexham.
Institution of Municipal Engineers (Yorkshire and Northern Districts).—A joint meeting will be held in Harrogate.

MONDAY, OCTOBER 21.

Royal Sanitary Institute.—Mr. Alan E. Munby, M.A., R.I.B.A., on "Building Sites, Construction, and Sanitary Planning." 7 p.m.
East India Association.—Mr. E. B. Havell on "The Building of the New Delhi." 4 p.m.
Liverpool Architectural Society.—Presidential address. 6 p.m.
University of London (Victoria and Albert Museum).—Mr. Banister Fletcher on "Romanesque Architecture in Central Italy." 5 p.m.

TUESDAY, OCTOBER 22.

University of London (British Museum).—Mr. Kaines Smith, M.A., on "The Sea Kings of Crete." Lantern illustrations. 4.30 p.m.

WEDNESDAY, OCTOBER 23.

Royal Sanitary Institute.—Mr. Alan E. Munby, M.A., R.I.B.A., on "Ventilation, Warming, and Lighting." 7 p.m.
Manchester Society of Architects.—Mr. Halsey Ricardo on "Growth in Architecture." 6.30 p.m.

THURSDAY, OCTOBER 24.

Sheffield Society of Architects.—Mr. F. Radcliffe on "The Use and Misuse of Materials."
University of London (British Museum).—Mr. Banister Fletcher on "The Temples of Egypt." Lantern illustrations. 4.30 p.m.
University of London (Victoria and Albert Museum).—Mr. Kaines Smith, M.A., on "The Underlying Principles of Architectural Decoration." 5.30 p.m.

FRIDAY, OCTOBER 25.

The Institution of Municipal Engineers.—General meeting. 8 p.m.
The Royal Technical College Architectural Craftsmen's Society, Glasgow.—Mr. W. H. Baxter on "Some Effect of Recent Legislation on the Building Trades."
Royal Sanitary Institute.—Mr. W. E. Fretwell on "Details of Plumbers' Work." 7 p.m.

COMPETITION NEWS.

A list of current Competitions is printed on page 468.

Cheshunt College, Cambridge.

Eight architects have been engaged recently in a limited competition for the new Cheshunt College, Cambridge. Sir Aston Webb, R.A., the assessor, has selected the design of Mr. P. Morley Horder, R.I.B.A., and the Governors have accepted this award.

Windows in the Church of St. John the Divine, Richmond-on-Thames.

By Miss Mabel Esplin.

Proposed Kuraal, Folkestone.

It is proposed to erect a kuraal or band pavilion on the cliff below the Leas, between the existing shelter and Clifton-crescent. It is proposed that architects should be asked to send in designs, three premiums of 100 guineas, 50 guineas, and 25 guineas respectively to be awarded, although the Council will not bind itself to accept any plan. The cost of the pavilion is not to exceed 20,000.

Industrial Design.

The Council of the Royal Society of Arts hold a sum of 400l., the balance of the subscriptions to the Owen Jones Memorial Fund, presented to them by the committee of that fund in 1876, on condition that the interest thereof be spent in prizes to "Students of Schools of Art who, in annual competition, produce the best designs for household furniture, carpets, wallpapers and hangings, damasks, chintzes, etc., regulated by the principles laid down by Owen Jones." Competitions under the terms of this Trust have been held annually since 1878. The next award will be made in 1913, when six prizes are offered for competition, each prize to consist of a bound copy of "The Leading Principles in Composition of Ornament of Every Period," from the "Grammar of Ornament," by Owen Jones, and the Society's Bronze Medal.

MAGAZINES AND REVIEWS.

The *Antiquary* contains an article by Mr. J. Taveron Perry on "The Sanctuary and Basilica of S. Martin at Tours," with a good plan showing the different periods of its architectural history, an account based on personal observations made during two visits to Tours in 1864 and 1866. This church, as we need hardly say, is of the greatest interest, being an important link in the history of the Chevet, coming as it does between the Church of Charroux and the completed form of the XIIth-century cathedral. The eastern limb of Charroux obviously recalls a circular type of building, with its accompanying recesses or niches. At Tours the apsidal termination has become an accomplished feature.

The *Architectural Record* is devoted to a review of country houses, with numerous illustrations. The waning of Richardsonian influence is obvious, yet there is something of this discoverable in the stone examples from Pennsylvania. Twenty years ago this influence, if sometimes displayed with extravagance, was also productive of much that was essentially characteristic. It is doubtful if the new forces which are at present operating on American architecture have yet achieved a domestic style. The classic loggia, reminiscent of the Beaux-Arts, jostles not quite harmoniously with humbler features. Georgian Colonial, Spanish Mission, Southern and Dutch Colonial, these styles, we are told, are all elements that are moulding domestic design. Yet the characteristics of the modern French villa are apparent also. This foreign influence is deplored by one of the contributors as sapping all individuality. Designs submitted in competitions, he says, have so much in common that, whereas formerly it was possible to distinguish immediately the work of this or that craftsman, the hall-mark of any particular competitor has now ceased to exist. This criticism applies, we gather, to the typical Beaux-Arts design, but this levelling influence is calculated to affect creative power in every direction, save where the individual element is potentially the superior. Mr. George Moore lately prophesied that fifty years hence, owing to the overlapping of natural styles and characteristics, there would be no art left at all.

The *Burlington Magazine* recognises in an article of much interest the art of Guardi. There is poetry in topography. This *genius loci* manifests itself to the few perhaps only Charles Lamb felt it in the Strand, and Samuel Johnson in Fleet-street. Guardi's imagination found expression in Venice. Painters who are also lovers of architecture are rare, and we do well to cherish their memories and show ourselves jealous of their reputations. Kant's "Theory of Art" is remarked upon by F. Melian Stawell. The

more we pursue such philosophic investigations the more readily do we find ourselves accepting as sufficient, the dictum of Whistler that "art happens." Pegasus harnessed was not more restless than art, when we subject it to the tests of *musts* and *mights*. Philosophies have not helped to establish the reputations of Rembrandt or Michelangelo. Where they have operated they have been perhaps more destructive than creative. Art is a science rather than a philosophy. The artist knows.

Scribner's Magazine devotes many pages to the consideration of "The Problem of the Modern Terminal," or terminus, as we more familiarly express it, although we are gradually accepting the former, as we are also substituting "concourse" for booking-hall. Great Britain was the parent of the railway, and the dignified conception of the terminal station was a fit monument to the enterprise. If our railways have been handicapped by an extravagance of expenditure at the time of their construction—a charge often preferred against them—the money expended upon the portico at Euston, or what was once, in a relative sense, the spaciousness of Paddington, was money well spent. Where a misplaced economy was the objective, expense had to be incurred later. The old Shoreditch Station gave place to Liverpool-street, and Waterloo is now being converted into a terminus of the latest "end-on" type. And America is spending millions of dollars for similar reasons. Her opportunity is a magnificent one. The importance and magnitude of her railways call not only for suitable provision for the comfort and convenience of their passengers, but for adequate architectural expression in those buildings which are associated with them. Such buildings are "The Gates of the City." The Pennsylvania and the Grand Central Station, New York, are endeavouring to meet these demands. The vast increase of local traffic has doubtless made an entire reorganisation of terminal traffic a necessity in America, and has created expedients for dealing with it. The curtailment of the building area has also to be considered where the requirements for long-distance travelling are numerous. Buffets, dressing-rooms, shops, and even hospitals, are included in the larger schemes. No longer can Ruskin's definition of a railway-station, "the very temple of discomfort," be maintained. Thus the new Grand Central has its suburban concourse upon a floor below the main-line concourse, and the suburban tracks a story lower still, and passing beneath the main line. A typical instance of the importance of detail in traffic management occurs in the alteration of platform level from 9 in. above the ground, which has hitherto been the customary elevation, to the higher level familiar to us. Such an alteration enables a suburban train to unload in forty seconds instead of a minute and over—an appreciable difference at periods of congestion. It also shortens the stairway where tracks are at a low level. The linking-up of the various main lines was accomplished to a certain extent by the Metropolitan Railway, a scheme that has been still further developed by the Tubes. The Ceinture in Paris was also a modest venture in the same direction. The possibilities foreshadowed by such enterprises have raised the question whether terminal stations will not one day be a thing of the past, and one vast clearing-house for passengers take their place. This suggestion is also hinted at in the pages before us. In view, however, of the enormous sums being now expended on terminals to the various trunk routes, such a possibility is scarcely likely to achieve reality.

The *Studio* contains an appreciation of Edward Lanteri by Mr. L. R. McAlister. There can be no doubt that Professor Lanteri is a great power at the Royal College of Art, and has done much to build up its reputation. "We have nothing like this in Paris, nothing to approach it," said M. Rodin, when he visited the modelling section of the College. Lanteri's facility in portraiture is of the most convincing kind. His bust of Monsignor R. recalls the decisive touch of that XVth-century master Mino di Fiesole. The art of the etcher lends itself with some success to reproduction, and "Some Etchings From the Recent Salons in Paris" present examples of the work of August Lepère, Eugene Bèjot, and Herman

Webster. The two latter have been known for some little time on this side of the Channel. Mr. Webster is an American living in Paris. Lepère is becoming known, and his work is beginning to be sought after by collectors. The prices now realised by the prints of these two dozens of etching, Mr. D. Y. Cameron and Mr. Muirhead Bone, make the collector increasingly anxious to discover desirable possessions, and both Lepère and Webster are steadily increasing their reputation.

FIFTY YEARS AGO.

From the *Builder* of October 18, 1862.

Domestic Water-Filtering.

A PAMPHLET on this subject has been issued, along with the prospectus of a "Metropolitan Water-purifying Company," which it is proposed to establish for the very useful and sanitary purpose of improving the imperfectly-purified water supplied to the metropolis by the water companies. The author of the pamphlet is the projector of the company. He appears to have gone laboriously and honestly into the subject, although too sanguine in his expectations of obtaining ten out of every 100 houses during the first year as renters of his purifying apparatus, perhaps ten out of every 1,000 would have been a little nearer the mark.

The apparatus in question is a simple and effective one so far as regards its action in allowing a stream of water from the common cistern to flow continuously; but whether in a completely purified state we cannot say. The apparatus consists of a strong stoneware bottle, standing on knobs as feet, and perforated in the bottom; with a silver-coated pipe issuing from the neck, and to be bent over the top of the cistern downwards to a level below the bottom of the cistern, so as to act as a siphon. The stoneware vessel is filled with animal charcoal, which Drs. Lankester, Letheby, and R. D. Thomson recommend for all such filters; but of the efficacy of which we think more evidence is still required.

. Experience has justified the doubts above expressed. It is now universally recognised that any filter which cannot be periodically cleansed by the process of boiling is much worse than useless. Yet we recollect when it was quite customary for the over-cautious householder to have a practically immovable filter immersed in the cistern and secured to the supply. Carbon is an exceedingly porous material, offering but little resistance to the passage of impurities, and the receptacle of such a filter must speedily have become charged with organic matter. Reliance was at that time largely placed upon the oxygenating properties of charcoal, and this may still hold good in the case of water that has been previously boiled, to which it is desired to restore a more palatable flavour. But for the necessary purpose of offering a mechanical obstruction to impurities, which is now considered to be the important element in filtration, a denser material than carbon must be sought for, and consolidated earthy substances are employed to this end. Of such a nature are the Pasteur and Berkefeld filters, in which the filtrating medium is easily accessible and removable for the purpose of boiling.—Ed.

BRADFIELD COLLEGE.

Sir William Osler opened on the 9th inst. a new science school at Bradfield College, which has been built at a cost of 4,000l. The new school is a detached brick building with stone and flint dressings, and the architect, Mr. C. Steward Smith, of Reading, has, according to the *Times*, harmonised the design with the general idea of the older school buildings. Its accommodation consists of four laboratories—two for chemistry and two for physics—with a central lecture-room common to all the laboratories, in which forty boys can be seated. Though it is not intended that the laboratory classes shall exceed sixteen, the laboratories are large rooms, and there is ample space round the tables. Besides chemistry and physics, occasional work will be done in botany and biology.

BAROQUE ARCHITECTURE.

V.—VENICE.

(Continued from page 380.)

In one respect at least Venice surpasses all the other fair cities of Italy—in its wonderful and romantic situation. Here all architecture gains added glamour, and here the student of Baroque will expect his most academic Philistine friends to admit the actions of the style in a naturally picturesque setting. In Rome and in Genoa, we have seen, one of the characteristic features of the XVIIIth-century builders was to mould the face of Nature in order to glorify the work of man; in Venice the artificial lines of the canals formed a natural guide for the designers of magnificent churches and palaces. Here, with the great exception of St. Mark's Piazza, town planning was possible, for the plan had been drawn in mudbanks a long time ago in the Dark Ages. In Rome or in the nobleman's palace was a part of a scheme in which gardens, gateways, fountains had a share; a church was usually the culmination of a vista. In Venice the architect had to design a town

house or a town church pure and simple. He was bound down by problems of light and air; he was cramped in his means of access; he had to face all the thousand and one perplexities that beset a city architect to-day. But, hampered as he was in this way, he was building, as he must have known, on a site which for sheer fascination and charm has no rival. In the beauty of a Venetian summer day the most commonplace of design loses some of its monotony. Ruskin has said that if St. Peter's at Rome were to be seen properly it should be placed on the plain of Marengo or on the Grand Canal at Venice, where the scale is wholly human, and where Nature's insignificant Janiculum would not dwarf the work of man. In criticising Venetian architecture, then, one must beware of praising its masters for picturesqueness due to mere accidents of situation, just as one must ascribe to them credit for the way in which those accidents have been utilised to the best purpose.

Another difficulty which confronts all honest students of to-day lies in the vast

mass of criticism which has been lavished on Venice in the past. There can be but few cities which have inspired so much literature as Venice has done, and few where the amateur critic has played so prominent a part. Every few months a new, chatty handbook comes out which tells the visitor exactly what he must and must not admire, which pictures are good and which bad, where he must pause for the view, and where he must infallibly turn to the right. Side by side with these lighter works there come a long series of valuable monographs on history or art, bringing to light in the majority of cases new lore about those glorious centuries when Venice was one of the great powers of the world. Yet, great as is the number of books which tell of Venice and her story, there are few which are of use in enabling us to form our judgment on Venetian Baroque architecture. The chatty guide-book, for instance, tells us in regard to S. Maria Formosa that there is "a good picture altar on R. (Sacristian 20 c.)," but omits to mention any architecture

connected directly or indirectly with the church. The Palazzo Rezzonico is the scene of Browning's death, the Palazzo Pesaro is converted into a gallery of modern art, the Salute is a monument to a plague, and so on. But as buildings of any artistic value, we are left to suppose them negligible. Occasionally there is a note of gasping admiration at the money which Venice could find to raise these sumptuous structures, but where any writer condescends to criticism his remarks are for the most part harsh.

One man, and one alone, is responsible for all this hostility, and he is John Ruskin. His influence was so enormous, his public so large, his style so captivating, and his enthusiasm so disinterested that all his statements about Venetian architecture have become classic. Because Ruskin has written a treatise on Venetian art which is a monument of English prose, English people are at the outset prejudiced against a large proportion of the greatest buildings in that city. These articles do not pretend to be a panegyric of Baroque architecture; but we must put in a claim for a fair hearing, and in Venice, much more than in other Italian cities, one is liable in defending any form of post-Gothic art to be shouted down by the ghost of Ruskin. For there is no doubt that in this respect, at any rate, he was biased.

He divides the Renaissance period bodily into two parts—the Roman Renaissance and the Grotesque Renaissance. It is into the latter category, of course, that our subject falls, and what his standpoint was may be inferred from one sentence, intentionally symbolical of his general attitude, where, in speaking of a piece of carving on an historic church, he says:—

"In that head is embodied the type of the evil spirit to which Venice was abandoned in the fourth period of her decline, and it is well that we should see and feel the full horror of it on that spot, and know what pestilence it was that came and breathed upon her beauty until it melted away."

With the exception of Ruskin, however, the majority of critics whose opinion is worth anything are less severe on the Baroque buildings in Venice than in Rome. In the former city its picturesque side attracts them, and seems to suit the general scheme of things Venetian. Moreover, the average critic is less disposed to be cantankerous in Venice, where he feels himself to be on pleasure bent. Against us, then, we find three classes of critics arrayed—Ruskin tradition, openly and fiercely hostile; amateur talent, negligent and negligible; professional opinion, easygoing and not too discriminating.

These circumstances, together with the unique personality which makes everything connected with Venice doubly interesting, provide sufficient reason why we should examine the Baroque architecture of the place and compare it with that of Rome and Genoa.

The XVIIth century in Venice is usually described as the second part of the "Decline," but it is advisable to employ that word with caution, for men may differ as to what constitutes a decline. Ruskin, and many who hold with him, would date it from the League of Cambray in 1508, when the principal powers of Europe combined to ruin Venice, and in a sense achieved their object. It was a time of double-dealing, and the causes of the Decline are far more insidious than any treaty, underhand though it be. Venice had aroused the jealousy of two powerful rivals, civil and religious. Her enmity with Genoa rose from the keen maritime competition of the two States, her quarrels with the Pope were all due to her aggressive attitude in regard to matters of Church and State or to her tolerance in matters of theology. The long political struggle which finally broke the power of the Queen of the Adriatic may be traced to these two sources. Her armies were worn down by single-handed fights with the

Turks or by continual skirmishing on the borders of the Papal States.

But what operated more than anything else to the undoing of the city was her isolation from the new trade routes. Up to the discovery of the Cape route the wealth of Northern Europe came over the Brenner from German towns, the treasures of the East up the Adriatic from Constantinople. The XVIth century, however, saw Venice without the most of her German trade, and with a Constantinople which had changed from a hoard of riches to a bandits' stronghold. Protection tariffs were tried in vain, and the trade of Venice drooped and languished.

But that lack of trade means lack of money to spend is a long-explored theory, and just as it is often the sons of a *parvenu* who squander their self-made father's hard-won gains, so it was XVIth and even XVIIth century Venice who cast on the waters, in more senses than one, the amassed wealth of the preceding years.

"Inside the city," writes one of its most faithful historians, "the characteristic note was the public splendour, the private pleasure-chase, overlying and partially hiding State impoverishment and secret fear."

"The State and the great nobles still braved it in the eyes of Europe, but the bulk of her population was growing hourly poorer, her streets and squares were becoming the accustomed haunt of dissolute, pleasure-seeking Europe. The healthy, vitalising energies of commerce, of trade, and of industries were sapped."

"But as a curiosity and as a pleasure-house Venice still remained unrivalled in Europe. Gorgeous ceremonies for the reception of distinguished visitors; the theatre of San Cassiano, where the opera and Ballo of *Andromeda* was given in 1637, serenades, banquets, faction fights among the people, delighted the populace and attracted the foreigner. Young Englishmen of birth on the grand tour would not miss Venice, where they were presented to the Doge and taken over the Treasury of St. Mark. Plagues like those of 1577 and 1630 might sweep off fifty or eighty thousand inhabitants, but the scourge passed by, the masques and balls began again, and all that remained of the memory were splendid churches like the Redentore or Santa Maria della Salute. *Bravi*, gamblers, broken men, . . . quacks . . . witches . . . flourished and fattened on a cosmopolitan population, but the whole chorus of foreigners is unanimous in applause."

Although, then, there must have been an insidious decay in Venetian character and morals throughout this period, the normal course of things where an industrious and independent city becomes a mere pleasure resort for wealthy and luxurious outsiders, it does not seem fair to admit its outward manifestation at any rate until well into the XVIIIth century. And among its external aspects one of the most obvious is in the character of its buildings.

In the first half of the XVIth century was erected that wonderful group of Renaissance masterpieces round the Piazza of St. Mark, including Sansovino's famous Loggetta, and towards the close of that century we detect in a very plausible guise "the germ of the barocco corruption." Again reverting to our theory of Baroque being marked by originality of conception rather than by superabundance of ornament, we find in the two most famous bridges of the city something which was not present in Renaissance work, even of mature date, a tendency towards the "quaint conceits" of the XVIIth century.

Yet in the Ponte di Rialto one can admit no more than a striking boldness and freedom of design, an independence of conventionality which is remarkable, in view of the wave of pedantry sweeping over Italy. One could not but expect that in Venice there would be a greater license, a greater lack of architectural restraint, a more fantastic spirit than in other cities. The

luxuriant decoration which one finds alike in the Ca d'Oro and in little remnants of palaces all through its canals and alleys, in the magnificent tombs to departed Doges of the XVIth century, is no more apparent in the XVIIth century than in that last final flourish of late Renaissance days—the State rooms of the Ducal Palace. Here, again, we feel ourselves to be on the Baroque borderline, but on the whole it seems best to forego any claim on these gorgeous salons with their brilliant ceilings sparkling with colour and gold, and to return to the Bridge of Sighs.

This Ponte dei Sospiri has gradually acquired an immense hold over people's minds for sentimental reasons, and has been the cause of as many tears among high-strung visitors to the city as that ill-starred letter-box grimly displayed in the Palace of the Doges. Yet in this case the tears are justifiable, for it is authenticated that prisoners did undoubtedly cross the bridge to receive sentence and return to suffer death. Prisons have inspired architects on sundry occasions, and one recalls George Dance's wonderful design for Newgate, where every line of the building seemed to indicate its purpose. Dance had something in common with these Italians, something of that quaint and dreamy fancy which led him out of the ordinary ways of men. Here, however, the dramatic instinct, always more powerful than the religious at this time, has evidently not guided the architect (Antonio Contino) so much as his sense of the artistic; and he has concerned himself with providing a harmonious link between the widely different styles of the Palace and the prisons. Its dread significance is possibly hinted at by its absence of windows, but the inevitable gaiety of Venice appears in the Baroque scrolls curling between finials above the cornice, and in the beautiful pierced screens which serve in lieu of windows, and which are a survival of those used on the lagoons a thousand years or so before.

It has been said by Dr. Horatio Brown, whose books have already been quoted in this essay, that Venetian art was public art, and that connoisseurship or private patronage was not so important to its well-being as at Rome or Florence. This is true only in a measure as to the monuments of the Baroque period, when very few really noteworthy public buildings were erected as against the countless fountains, aqueducts, and so on showered on Rome by Popes and Cardinals seeking popularity. It is true that the largest and most important building of all, S. Maria della Salute, was the work of the State, but, apart from this, we find chiefly private palaces and churches of varying merit.

The last great churches of the Venetian Renaissance are those two on the outlying islands which are due to the genius of Palladio—S. Giorgio Maggiore and the Redentore. Masterly and bold as they are, spacious and grand like many of those which followed, there is a distinct step from here to the Baroque churches of the XVIIth century. The beautiful carved choir-stalls and the magnificent bronze group on the high altar at S. Giorgio are perhaps transitional—so much Baroque as Renaissance. The Corinthian capitals betray a slackness of workmanship unfortunately characteristic of the later period, and the facade by Scamozzi is one of those pedantic designs which we often find overlapping the more lively Baroque movement.

It was in the year 1631 that the Senate decreed the building of the church of S. Maria della Salute as a monument of thanksgiving after the cessation of the terrible plague in which 60,000 people, roughly speaking a third of its total population, are said to have perished. Standing, as it does, on a fine sweep of the Grand Canal, yet so near the end of that wonderful waterway that it is equally prominent from the lagoon, this remarkable church has become one of the most familiar and frequently portrayed of

many treasures of Venice. To some it appears the last dying splutter of the Baroque flame; to others a monument of its kindred in any style; to others, again, a typically good or typically bad Baroque according as that sort of art suits their truth concealed in it. Baroque it is, if there was such a thing, different from the kind because all Venetian buildings do differ from their cousins in parts of Italy, a survival of the Baroque just as all the best Baroque buildings are, but rather a normal development than a survival. It is typically Baroque in its disregard of convention, in its brilliant striving after the magnificent and its superb suitability for its surroundings, in the way in which stairways even the Canal itself seem to lead up to it has the weakness common to many things of this period, that it is pagan rather than Christian, yet perhaps it would be more Christian than most, but for the tales at the back. Its Eastern flavour serves to show how thoroughly its architect, Longhena, had caught the whole of Venetian architecture, the most vital in Europe. Finally, its combination of brilliant and daring originality on a monumental scale with legitimate canons of design has ensured so successful a result that most of those who abuse Baroque with its gibes they can lay hold of are content to admire S. Maria della Salute. But the name of Ruskin is heard outside, and he is thus in his "Who's Who in Venetian Architecture," as we might call it:—

One of the earliest buildings of the Baroque Renaissance, rendered impressive by its position, size, and general proportions. The latter are exceedingly good; the grace of the whole building being chiefly dependent on the inequality of size in its cupolas, and the grouping of the two campaniles and their domes. It is to be generally observed that the proportions of buildings have been whatever to do with the style or the merits of their architecture. An architect trained in the worst schools and devoid of all meaning or purpose in his work may yet have such a natural gift of grouping and grouping as will render all his figures effective when seen from a distance; such a gift is very general with the Italian builders so that many of the contemptible edifices in the country produce a good stage effect so long as we do not reach them.

The Church of the Salute is farther assisted by the beautiful flight of steps in front of it to the canal, and its façade was chosen by the principal object in his known view of the Grand Canal.

The principal faults of the building are the narrow windows in the sides of the cupola, and the ridiculous disguise of the buttresses

under the form of colossal scrolls; the buttresses themselves being originally a hypocrisy, for the cupola is stated by Lazar to be of timber and therefore needs none."

It is amusing to find Ruskin here admitting the excellence of late Italian grouping, still more so to find that grouping and architecture are so foreign to each other in his opinion; but otherwise his remarks are of no particular use to architects, who would probably disagree with him as to the charms of the subsidiary cupolas and minarets, and who would find more fruitful points for discussion in the unconventionalities of the interior, where a gallery balustrade is perched well forward round the main cornice. To Baldassare Longhena, the architect of this great church, Venice owes a long list of famous buildings, but only one of them is ecclesiastical.

S. Maria al Scalzi, on the Grand Canal, near the railway-station, is unfortunately so inferior to the Salute that one can hardly recognise Longhena's hand therein. It is a medley of senseless polychrome decoration, marble and gilt everywhere (none of the marble being white), twisted columns, and indeed everything which one associates with the Baroque style at its very worst. It has been restored in modern times, whether for better or worse the writer is not aware. The façade, however, was added by Giuseppe Sardi in 1649, and is a much more pleasing composition on Venetian lines, showing considerable originality without going to extremes.

Sardi also designed the very remarkable façade of S. Maria Zobenigo, or S. Maria del Giglio, as others call it. Here we have translated into terms of Baroque the same motif as the elaborate Renaissance façade of S. Zaccaria, at least as regards the pediment. This bold and striking design is enriched with some of that exuberant, joyous, almost sensuous statuary which had taken the place of severer predecessors, and which at this time vaulted on church fronts the figures of goddesses in the free poses of Nature.

The six panels on the pedestals of the main order of this façade are sculptured into relief-maps of celebrated towns or of Venetian dependencies. The interior plan of the church is simple enough, having three recesses on either hand between the columns of a large order and a small chancel recess. The colour scheme is subdued and harmonious, with prevailing tones of grey and the rich tints of the three great paintings on the ceiling. The date of this church is 1680-3.

S. Lazzaro dei Mendicanti is another of Sardi's works of about this time, the church of a hospital for poor men moved here in the XVIIth century, but does not call for more than passing mention.

The façade of S. Moisé is contemporary with the last two, and is an orgy of decoration,

Campanile: S. Maria Formosa, Venice.

though, for some reason, it fails to shock one as it should. For, in spite of the usual athletic limbs of the saints and bishops on its skyline, the execution of all the detail is lighter and less coarse than in much Baroque carving of the period. Moreover, the detail itself is interesting; it may be almost said to be unique in its elements and its arrangement. The architect was Alessandro Tremignon, or Tremignan. Within the church there is much less to attract us, it being covered with indiscriminate decoration of a kind far inferior to that outside.

A refreshing contrast to the last is San Vitale, or San Vidal, a plain little church seldom troubled by visitors, lying near the Accademia Bridge. The façade indeed is so without freedom as to be barely definable as Baroque, decorated only with statues of the pious founder (a Doge) and his wife, and the good old cleric who inspired them to the deed. The grey and white interior has Corinthian columns.

Then there is Sant' Eustachio (or S. Stac) on the Grand Canal, built by Giovanni Grassi in 1678, with a façade by Domenico Rossi, dating from 1709.

There is S. Maria Formosa, with its strange campanile, a church remodelled in 1692 by Marco Bergamasco; and there are many more, but few among them are so important or so large as the great Jesuit temple—S. Maria dei Gesuiti, built in 1715-28, on the side of Venice nearest to Murano. We cannot but feel that here, as in many other parts of Italy, the Jesuits were too ready to make a display, too forgetful that an atmosphere of flaunting wealth may stifle any devotional feeling. Strip half the decoration from this church, and it would be admirable. The plan is excellent, and is monumentally conceived; the decoration is to a large extent good; the materials are priceless. Take, for example, the wall-lining, reminiscent of Morris tapestries or wallpapers, in cool green and white. Examine it more closely and you find it is of green and white marble inlaid. There are curtains in gorgeous tints which turn out to be also of marble; the very carpet on the steps leading to the altar is in the same precious stone. But if this church had all been finished, say in white and green and gold, with no other colour admitted, not even perhaps the lapis-lazuli of the altar, we should have had those same critics, who cite it as an example of how bad Baroque is, taking a totally opposite view, and perhaps trying to deny that it

S. Maria della Salute, Venice.

was Baroque at all. S. Maria dei Gesuiti may be an architectural curiosity; it is as much a lost opportunity.

On the Zattere is a smaller church of very similar name, S. Maria dei Gesuati, or del Rosario, built in 1726-43 by Massari, and sharing the trend towards a more eclectic style.

But before leaving these churches of Venice something should be said of their monuments. The family tomb in Venice had assumed vast proportions even in the XVIth century—one has only to visit the churches of S. Giovanni e Paolo or the Frari to see that—but in Baroque times it became colossal and lacked all the delicacy which one sometimes associates with smaller works of the kind. Familiar and frequently-illustrated examples are those to Doge Falier, in S. Giovanni e Paolo, by Andrea Tirale (1708), and that to Doge Giovanni Pesaro, in the Frari (1659), by Longhena.

Of Venetian Baroque palaces two exist of such outstanding importance that no others need be mentioned. They are both the work of that great genius Baldassare Longhena, and date from the second half of the XVIth century. As might be expected in an epoch of ostentation, their exteriors are of chief interest, though a certain skill is to be found in their planning, always on a vast scale.

The Palazzo Rezzonico (1650), on the Grand Canal, has at present little celebrity outside our profession except as the scene of Browning's death, but as Victorian prejudices gradually melt away we shall find the amateur critics coming round to agree with most architects that no pure Renaissance front on this canal compares with it.

The Palazzo Pesaro (1679-1710), also on the Grand Canal, closely resembles the last in general proportions, but is very much more ornate. Its cost is said to have been 500,000 ducats. It was built for one of the great officials of the State, the Procurator of St. Mark's, and its construction occupied thirty-one years. From front to back its depth must be nearly double that of the Rezzonico, but in many ways it is inferior. The diamond rustication of the lower stories produces an effect of over-decoration on the whole façade, which otherwise would not have been caused, for a Venetian palace can carry an abundance of ornament without ill-effects.

It is curious that, abreast of some of his most Baroque designs, Longhena was building palaces in which not a trace of that "corruption" can be found. An example of this is the Palazzo da Lezze (1654), on the Rio della Misericordia, a pedantic though thoroughly Venetian design. Space forbids us to say anything of Cominelli's Palazzo Labia, where Tiepolo painted some famous frescoes, but no study of this period in Venice would be complete without some mention of Giuseppe Benoni's Dogana, or Sea Customs (1676-82), almost as familiar in pictures of Venice as St. Mark's Campanile or the Salute. Standing prominently on a point of land at the mouth of the Grand Canal, its quaint outline surmounted by a great golden globe, and a moving figure of Navigation, this is one of the many picturesque features an ungrateful generation owes to Baroque Art.

M. S. B.

DISCOVERIES AT WEST HORSLEY CHURCH, SURREY.

SOME important and even puzzling discoveries have been made at West Horsley Church, which is now being restored under the direction of Mr. William Weir, of the Society for the Protection of Ancient Buildings. The church is situated by the side of the road leading from Leatherhead to Guildford, and among other reasons is of interest from the fact that there is well-founded ground for believing that Sir Walter Raleigh's head was buried there. Horsley House, the beautiful old mansion almost opposite the church, was once the seat of the Raleigh family.

Of the discoveries made in the church, perhaps the most notable is that of the remains of two low arches, one on either side of the chancel arch, the latter having cut through the smaller and lower arches. What would have been the actual height of these arches cannot be told, as there is not enough of them left, yet sufficient can be seen to make it clear that there must have been two, for one could not have bridged the space between the jambs. But two arches of about such height as these must have been, with a pier between, would give the requisite width. Nor can it be said to what period they belong, though they must be quite early, possibly Saxon. The present church, by the way, was founded in 1086. Antiquaries who have visited the church while the restoration has been going on have been greatly puzzled as to what these arches could have been, and have offered many and varying solutions of the problem. One suggestion which seems feasible is that they are the remains of a stone screen. We know on the authority of Mr. F. Bligh Bond that triple-arch screens were often built in the IXth and Xth centuries, and again in the XIIth, and it is possible this may have been a double-arch screen. Another suggestion which has been favoured is that these arches were part of an arcading at the east end of an earlier church. Anyhow, they are probably the oldest part of the existing building.

A further discovery made in the chancel arch was the staircase and doorway leading to the roof-loft. To ensure the safety of the arch it was deemed necessary to build up this stairway, for it was 2 ft. 6 in. wide in a wall only 3 ft. thick, and the arch was not safe. But the doorway to the roof-loft is shown, framed in timber.

A third find in the east end of the church, resulting from the stripping of the plaster from the wall, was in the south-west angle of the chancel, where may now be seen the remains—one jamb—of what appears to have been a low-side or so-called "leper" window. This was probably built up when the Perpendicular south aisle and the Nicholas Chapel were added.

At the western end of the church the chief discovery—again resulting from the stripping of the plaster—was the finding of the remains of frescoes on the west wall. This wall is part of the original Norman structure, and Mr. Weir thinks that the string course ornament of the fresco on the south side of the door has a Norman look. There are three tiers of figures in the frescoes in this case, but they are very indistinct, and it is difficult to say what they represent. On the lowest tier there appears to be a man who is waving away some beggars. On the row above are more men, and on the top row are two crucifixes—careful study having failed to reveal a third. On the north side of the door is a fresco of a life-size figure of a woman, probably of later date than the work on the south side. On either side of her is a banding which may represent a column, but no arch can be traced.

The tower, which is at the west end, has been built on to the nave at a later date, the lowest part being probably of the XIIIth century, the next stage XIVth century, and the top later still. The work now going on has revealed the fact that the tower was not bonded to the west wall in any way, and it has been further discovered that the plaster, with which the exterior of the west wall was already covered when the tower was added, was not even cut away. The north and south walls of the tower were cemented to the plaster. This is very curious. On the first floor of the tower, at the junction of the XIIIth and XIVth century work, has been found a very old timber floor, and on it rested the remains of an ancient belfry.

These are the principal discoveries as the result of the restorations, but two or three minor finds may be mentioned. One of these is the revealing of a third lancet window on the north side of the Early English chancel. This light is indicated on the outer wall, but could not be opened, as it might have endangered the safety of a Decorated window by its side. Then, in the Nicholas Chapel has been found, behind a large monument, the upper part of a Perpendicular window, which was originally the east window of the chapel, and on the south wall has been found, behind the monument to some members of the Nicholas family, a small door leading into the chapel. This door is XVIth century.

A few remarks concerning the church, apart from these finds, may be added. As stated, the present building dates back to 1086, and it is mentioned in Domesday Book. The north

arcade, cut in the Norman masonry, is probably Transitional. The south arcade is rather late in the Perpendicular period. It is difficult to date the chancel arch, but the chancel itself is Early English. On the north side of the chancel is a beautiful canopied altar tomb of the Decorated period. Resting on the side of the tomb is the finely-sculptured figure of a cleric, either Roger de Berners, rector of the parish, about 1320, or Ramulf de Berners, rector about 1350. On the canopy are some admirably-sculptured monkey heads—monkey was the crest of the De Berners family—and these animals figure in the stained glass of the window above. In the east window is some glass of the time of Henry III. or Edward I.

With regard to the connexion of the church with Sir Walter Raleigh, it appears that the Nicholas family bought West Horsley House from Carew Raleigh, son of Sir Walter, in 1661. After the execution of the latter Lady Raleigh it is said, kept her husband's head and through the years of her long widowhood, and then passed into the possession of her son Carew and was buried at the time of his death. In 1707 a head was dug up just outside the east wall of the Nicholas Chapel. There were no traces of any bones of a body, nor was the grave big enough to have admitted such.

THE CHURCH OF ST. THOMAS, PORTSMOUTH.

THE Church of St. Thomas, at Portsmouth, is in course of restoration, and an appeal is being made to the citizens for funds to complete the work to the tower. The church stands in the High-street of the old town, which was originally confined to a small area and surrounded with walls. A grant made by John de Gisors in 1180, "for the erection of a chapel in honour of the glorious martyr Thomas, formerly Archbishop of Canterbury," gives the earliest possible date of the building, and the details of the eastern portion show that the work must have been begun soon after the grant was made. No clear indication of the original scheme as a whole can be obtained, the central tower was taken down and all the work of the crossing rebuilt between 1683 and 1690, the date 1691 over the west door shows the progress of the work. The chancel, which was restored a few years ago, is 54 ft. by 25 ft. It has two bays with vaulted aisles. The north and south transepts are 25 ft. wide, the north transept being 39 ft. long and the south 29 ft. The nave—86 ft. by 27 ft. 6 in.—is of four bays, the eastern, representing the crossing, being wider than the others. It has round arches springing from columns which support leaf-galleries. The north and south aisles are 18 ft. 6 in. wide. At the west end is a fine organ, said to have been made for Tewkesbury Cathedral, and set up here in 1718. In the church is seen an abrupt transition from the work of the early Gothic period to that of the late Renaissance, with its tall column and the typical work of the time.

The external effect of the building is imposed both from its scale and from the fact that the tower at the west end is very plain and massive. It has small belfry windows, which are now hidden by the large dials of the clock. The tower is capped by a wooden domed cupola erected in 1702, with a lantern above, from which rises a spirelet with a fine gilded vane in the form of a three-masted ship, with flags at the bowsprit, fore, main, and mizen masts, and a large flag on the gaff. This was set up in 1710, and was the gift of Prince George of Denmark, consort of Queen Anne. He also gave to the church eight bells, said to have been brought from Dover Castle. They were recast at his expense, and placed in the tower in 1704. A small bell, which formerly used to give warning of fire, was removed in recent years from the church, and is now in the museum originally the Guildhall—on the opposite side of the street. The bell is of Spanish workmanship and bears the arms of Leon and Castile. The monuments in the church are of no great interest, except that of the Duke of Buckingham, who, when on the point of embarking with the army for the relief of Rochelle, was assassinated by Fenton, in the High-street, in 1628. James II. gave to the church a set of plate, the record of this gift being preserved in the registers on the back of Charles II.'s marriage certificate. The earliest register runs from 1653 to 1662. The second is a finely-bound book; it begins with the record of Charles II.'s marriage on May 7, 1662—now cut out and framed and hanging

the vestry—and contains baptisms and burials to 1694 and burials to 1678, with a marriage of Charles II. The marriage of Charles II. of Braganza did not, however, take place in the Church of St. Thomas. Standing at a distance from what is known as the "Garrison Church"—a raised terrace that once counted as a defensive work—is the Garrison Church, a building of great historical and architectural interest. It has a vaulted chancel, a nave with aisles of five bays (an); the chancel was the chapel and the living-rooms of the hospital of St. John the Baptist and St. Nicholas, otherwise known as God's House, founded by Peter des Roches, of Winchester, before 1214. On November 2, 1214, John granted a charter of confirmation to the hospital, "in honour of the Holy Trinity, the Blessed Virgin, the Holy Cross, the Blessed Michael, and All Saints for the maintenance of the poor." In 1229 provision was made for the privileges of God's House should not be with those of the parish church, and the former was bound to pay 5s. quarterly as a pension to the mother church. A chantry was

formed here in 1325, with the assent of William de Hareweden, warden of the house of St. Nicholas and the convent of the same, and with the bishop's confirmation. Bishop Wykeham, by his will, left a set of vestments and a chalice to the hospital. Leland, who was at Portsmouth in 1539, says:—"There is also in the west-south-west part of the town a fair hospitale, sumtyme erected by Petrus de Rupibus, Bishop of Winchester, wherbyn were a late xij poore men, and yet vij be yn it." This house was surrendered to the Crown by John Incent on June 2, 1540. The last master of Portsmouth Hospital and of St. Cross, Winchester, is identical with John Incent, born at Berkhamstead in 1480, who became dean of St. Paul's. He founded the Berkhamstead Free Grammar School in 1541. Some of the buildings of God's House were used as a residence for the Governors of Portsmouth down to recent times. It was in these buildings—not in the chapel—that Charles II. was married. The allied sovereigns lodged here in 1814. With the exception of the chapel, the whole of the buildings were demolished in 1826. The Garrison Church was renovated and refitted by G. E. Street, R.A. about

1866. An ancient plan of the town of Portsmouth, made in the reign of Queen Elizabeth, shows the Church of St. Thomas, with its central tower, the buildings of God's House, the chapel, garden, and the wall which enclosed the whole. The "Platform" and "Square Tower" are here also, as well as the "Round Tower," which for so many centuries has guarded the entrance to the harbour. Edward III. began it, and from it Henry VIII. stretched across the waterway his "mighty chaine of yron"; and it now stands sentinel over the "boom"; that is to keep our ships safe from torpedo attack. Not many years ago the Garrison Church still had an altar cloth adorned with the arms of Portugal and a view of Lisbon, which, it is supposed, was used at the marriage. The town's wedding present—a gilt salt-cellar—is among the regalia in the Tower of London. Within the church is a brass to the memory of Captain John Mason, the founder of New Hampshire, in the United States, Captain of Southsea Castle, and Buckingham's host at the time of the murder. The history of the parish church is closely interwoven with that of the town of Portsmouth and with many great and

Garrison Church, Portsmouth: Ground Plan.

stirring events in our history. St. Thomas's tower has been a landmark for centuries to those returning home to "peace after stormy seas," and it may be hoped that the necessary funds will be provided for the preservation and maintenance of such a structure.

PALÆOLITHIC PAINTINGS IN SOUTH WALES.

An important archaeological discovery is announced in the *Times* of October 14. Hitherto no example has been known in the British Isles of the paintings of the Palæolithic Age, which have been found in several parts of France and Germany, and which include those vigorous representations of bison, mammoths, and other animals that proved such a surprise to the archaeological world. The distinguished French *savant* Professor Breuil on a recent visit to Oxford was much interested by the objects discovered in 1828 by Dean Buckland in Paviland Hole, on the Gower coast. A skeleton tinted with red ochre, known as the "Red Lady," and various implements and ornaments of flint and mammoth ivory convinced him that they belonged to the Aurignacian period, the earliest of the three stages of the Upper Palæolithic epoch. An investigation of the district was undertaken by him in company with Professor Sollas, of Oxford, with the object of ascertaining whether any paintings of the same period existed there. After a fruitless examination of a number of caves, they were at last rewarded by the discovery in Bacon's Hole, near the Mumbles, of an example of this ancient art, protected by a stalagmite deposit from obliteration. It consists merely of a series of red bands arranged one above another, similar to those found in the Font de Gaume in the Dordogne, but none of those delightful animal pictures. Since, however, one example of this primitive art has been found in our islands, we may well hope that others will eventually come to light.

THE TOWER OF BABEL.

The description of the building of the Tower of Babel as conceived by the medieval mind, given in the *Builder* for July 20, can be compared with that of Flavius Josephus, the Jewish historian, in his "Antiquities of the Jews," published in A.D. 93.

He says that the three sons of Noah—Shem, Japhet, and Ham—who were born one hundred years before the Flood, were the first to descend into the plains after the Flood, and persuaded others who were afraid of the lower grounds on account of the Flood to do likewise. The plain in which they dwelt, he says, was called Shinar.

The idea of building a tower he attributes to Nimrod, a grandson of Ham, "a bold man, and of great strength of hand." Josephus says that he, Nimrod, said "he would be revenged on God, if he should have a mind to drown the world again, for that he would build a tower too high for the waters to be able to reach." They, therefore, commenced the building of a tower, "neither sparing any pains, nor being in any degree negligent about the work; and by reason of the multitude of hands employed in it, it grew very high, sooner than anyone could expect, but the thickness of it was so great, and it was so strongly built, that thereby its great height seemed, upon the view, to be less than it really was."

Now follows the most interesting part of the description, wherein the materials employed are described.

Josephus says:—"It was built of burnt brick, cemented together with mortar, made of bitumen, that it might not be liable to admit water."

Later he says that the place wherein they built the tower is now called Babylon, because of the confusion of that language which they readily understood before, for the Hebrews mean by the word *Babel*, confusion.

The Sibyl also makes mention of this tower when she says—"When all men were of one language, some of them built a high tower, as if they would thereby ascend up to heaven, but the Gods sent storms of wind and overthrew the tower, and gave everyone his peculiar language, and for this reason it was that the city was called Babylon."

With regard to the material of which this tower was built, the Bible says:—"Go, let us

make brick, and burn them thoroughly. And they had brick for stone, and slime had they for mortar." Of course, this cannot be considered as independent proof in support of the description given by Josephus, as he most certainly consulted the ancient Jewish records, amongst others, for material for his writings, but we do not know what other evidence he had for his description of the material employed.

This much we do know, that bricks were used long before the time of the building of the Tower of Babel, both burnt and unburnt. Sun-dried bricks, or "adobes" (still made at the present day), were made by the Egyptians of Nile mud with reeds to form a binding; and to give only one instance of many, Sargon of Akkad made burnt bricks *circa* 3800 B.C., whereas the Tower of Babel was built some 1,700 years later, or *circa* 2247 B.C. Even glazed tiles were made before the Tower of Babel was erected.

As for the employment of bitumen for lime, this was but natural, as it was, and still is, a product plentifully supplied in these hot regions by nature. It was to be found oozing out of the ground, and in the form of lakes, some of not inconsiderable size. Tacitus describes the third lake into which the Jordan flows, and says that at certain times it throws up a quantity of pitch or bitumen, the gathering and use of which experience, the mother of all useful arts, has taught.

Birs Nimrud, the traditional site of the Tower of Babel, is but a hill of ruins, surrounded by the remains of the ancient city of Babylon. A hill of ruins surrounded by other ruins, standing in a vast silent plain, once a noble city filled with many inhabitants, and the home of the greatest king of his day, but now returned again to its first silent state, a sandy desert waste.

HISTORICAL NOTES.

The Baths of Caracalla.

THE excavations recently carried out in the Baths of Caracalla have led to important discoveries both from the artistic and antiquarian points of view. In the so-called "stadium" of the baths the medieval hunklin, in which it was the practice to calcine the marbles gathered from the surrounding ruins, has been found, and near it fragments of the rare marble of which the baldacchini columns at San Gregorio are formed. The clearing of the drainage channels of the baths has yielded two archaic statues of Greek marble of Apollo and Bacchus respectively, a fine life-size torso of an athlete, a charming statuette of a satyr, and, most beautiful of all, a more than life-size statue of Venus Anadiomene, with the arms raised in the act of arranging her hair.

The important remains of a temple of Mithra have also been discovered. "The main hall," says a correspondent in the *Morning Post* of September 9, "is composed of a large central nave paved with black and white mosaics and two side aisles, each divided into three parts by three [?] rows of three columns." The temple, the largest known, is rather over 70 ft. long and nearly 32 ft. wide. The Mithraic cult, especially popular among the soldiers of the Roman armies, was very widely spread throughout the Empire in the early centuries of Christianity, with which it had certain analogies, particularly in its doctrine of the remission of sins through the shedding of blood. Its ceremonies were conducted in subterranean chambers like this temple. The Taurobolium, or slaying of the bull by Mithra, is represented on the walls, while one of the altars, almost cubic in form, represents rocks among which a snake is wriggling.

Lord Llangattock.

LORD LLANGATTOCK, F.S.A., who died on September 24 at his country seat, the Hendre, near Monmouth, aged seventy-five years, restored at his own charges several churches in the county; to Monmouth he gave the public hall and gymnasium. He owned 6,100 acres in Monmouthshire and much property in Bermondsey, Southwark, Newington, and Camberwell. To Southwark he presented the site of the free library. He was educated at Eton and Christ Church, and was elevated to the peerage as Baron Llangattock, of the Hendre, in 1892. His portrait-bust, by Sir W. Goscombe John, R.A., was recently presented to him as Provincial Grand Master for the Eastern Division of South Wales.

Chester Cathedral Cloisters.

REPAIRS are now in progress in the cloisters of Chester Cathedral under Mr. Gilbey Scott. They were rendered necessary by the collapse short time ago of part of the vaulting in the eastern walk. On examination it has been found that a mass of earth and debris, estimated to weigh 250 tons, rests upon the top of the vaults, and it is therefore not surprising that the weight and moisture should have caused the accident. This rubbish, which has not been removed, is supposed to represent the remains of the Dorter, which is known to have occupied this position, and was allowed to fall into decay.

The repairs have brought to light some interesting architectural features, including a doorway leading from the Dorter to the staircase by which the church was reached at night, and a small quatrefoil window. Three small brick-up windows found over the reading pulpit in the refectory are to be restored, as the Dean and Chapter are now proposing to restore the whole of this apartment, which has been much disfigured by utilitarian alterations from time to time. The entire cost of the works is estimated at £10,000.

The Bishops' Well, Glasgow.

IN some work of reconstruction at the Royal Infirmary, Well, Glasgow, has been discovered what is believed to be the Bishop's Well, appertaining to the palace, of which the chapel and ruins gave place to the building of the Royal Infirmary, to the west of the Cathedral, at the close of the XVIIIth century. The well has been found immediately beneath the entrance steps; it is vaulted, in concrete to about 5 ft. square, and has a boarding oak on two sides. The well has been filled to within a few feet from the top, and a brick wall, built on the south side, forms a sump for surface-water and perhaps land drains; a pipe sewer was also inserted for draining the well away.

The Episcopal Palace, Sonning, Berks.

IN the course of excavations at Holme Park last week has been discovered some interesting remains of the old manor house—a palace of the bishops and deans of Salisbury, and originally, it is believed, the episcopal seat of a medieval diocese during the separation of Berks and Wilts from Sherborne. In Sonning Palace Richard II.'s consort, Isabel, lived the interval between his deposition and death at Pontefract. The remains now brought to light comprise some well-preserved tiles of glass, old pottery, knives, and a silver pew-minted at York, 1504-9. There are also fragments of stone masonry and stairs, tiled floors and medieval fireplaces, with walls of flint and stone that encompass an area of nearly 10 acres in extent. The work of exploration was undertaken at the instance of Mr. Heyson, well-known archaeologist.

A St. Paul's Museum.

ACCORDING to the *Times* of October 1 the authorities at St. Paul's Cathedral are considering the disposal of a number of fragments of woodwork, including specimens of carving in oak by Grinling Gibbons, and his school of great beauty, which are at present stored useless and unseen in various nooks and corners, especially in the Oak Room over the choir. It is felt that these and other objects of interest in their possession should be made available for public inspection, and it has been suggested that they should be presented to the Victoria and Albert Museum, either singly or in the case of the woodwork, made up into a stall, if the material is found sufficient and suitable for this purpose. Another suggestion is that a museum might well be formed within the Cathedral itself for the exhibition of many objects of artistic and historical interest in connexion with the present and previous fabrics, a museum analogous to that of the Opéra del Duomo at Florence.

Rubbings of Monumental Brasses.

MR. J. S. M. WARD, F.R.Hist.S., who has contributed articles on our pages on several occasions, has in the press a book of monumental brasses illustrated with twenty-five reproductions of "rubbings" of real archaeological interest, attaching memorial brasses, hitherto known and appreciated only by the few, and the little volume preparation should be acceptable to students of the subject.

THE BUILDING TRADE.

THE INSURANCE ACT : EMPLOYEES' REFUSAL TO PRODUCE CARDS.

WE have already commented on the duties of employers in connexion with insurance cards or books, showing that it was an offence under the Insurance Act and the rules made thereunder for an employer to retain an employee's book or card, or reverse side of the card is raised in a communication received by Messrs. Gratzke, from the Insurance Commissioners and published in the *Times* for 4th inst. in answer to inquiry as to what steps must be taken by a workman to refuse to produce his card. The answer was that the employer must get a stamp on an emergency card (see Rules dated 12, 1912, proviso to Rule 5). Messrs. Gratzke, however, wrote in reply that workmen not only refused to produce cards or obtain them, but they also declined to allow the firm to make any deduction from their wages. The Commissioners already prosecuted several employers who failed to comply with the Act, so perhaps they will turn their attention to reclaiming employees who place their employers in a position of difficulty.

Regarding insurance cards under Part I. of the Act, under Rule 5 (2) it would appear that an offence for an employed contributor to fail to produce his card when reasonably required to do so for the purpose of stamping; under Part II. of the Act we can find no provision as regards "unemployment." Rule 3 (2) only says "it shall be the duty of the workman to deliver or cause to be delivered his book to the employer." Does it involve a penalty?

In another question arises, Can a private individual institute a prosecution for an offence under Part I. of the Act? Under Part II., by (1), it is clear that proceedings for a refusal to comply with the regulations can only be instituted by, or with, the consent of the Board (see subsect. 3); but sect. 69, which deals with the breach of Part I., or of any regulations made thereunder, contains no such restriction, merely enacting that a person guilty of such an offence shall be liable to a penalty "on summary conviction," becoming daily more apparent how the Act is bearing upon employers. They are made the collectors of the sums due from their workpeople, and they are to find the sums due in the first instance themselves; if the workpeople throw difficulties in their way they have to perform a duty laid upon them by the Act on the workman, to procure an emergency card. If their people are guilty of the offence of refusing to produce a card under Part I. of the Act they are able to prosecute, under Part II. they do so by permission of the Board.

If the workpeople refuse to allow their employers to deduct from their wages, the Act contemplates, the employer has no recourse to proceedings to recover them. How is it in these days of labour unrest for employers to be continually taking proceedings against their workmen for the recovery of such sums?

It may be said that, as the Act is framed, the burden will seem to be laid upon the employers; but as it stands the least the employers can do is to prosecute workmen who carry out their duties under the Act, to confine their energies to employers. But by no means least, it surely should be an offence for a workman to decline to allow an employer to deduct the workman's contribution from his wages.

NEW DISPOSAL WORKS, ILLKESTON.

Mayor of Ilkleson (Councillor S. Shaw) has opened new sewage disposal works for the borough of Ilkleson. In responding to a vote of "The Engineers," proposed by Mr. C. A. Sudbury, Mr. Wilcox said he embodied the most recent scientific principles of sewerage disposal. The estimated cost of the works submitted to the Local Government Board was £2,000, and the scheme had been tried out well under the estimate. During the construction of the works no less than £100 had been paid in wages locally.

BUILDING BY-LAWS.

At the annual general meeting of the Institution of Municipal Engineers on October 11 Mr. Frederick W. Platt read a paper on "The Modernising of Building By-laws," in the course of which he said:—

"The recent circular letter of the Local Government Board to local authorities directing attention to the need of reviewing the existing codes of by-laws in operation in the various local governing centres of England and Wales is deserving of much attention. The Model Code has, on the whole, been serviceable. It now needs modernising, and the intention of the Board to do so is greatly welcomed."

The authors of the Model Code in drafting the earlier forms of by-laws had regard mainly to buildings of stone or brick construction, and, apart from what is considered their respective character, they are inappropriate to types of construction now in use, such as buildings of hollow blocks or slabs of terra-cotta, concrete, reinforced brickwork, etc.; for hollow or half-timbered walls and steel or other framed walls hung with tiles, slates, etc., filled in where necessary with incombustible materials; for buildings where piers are employed, and where large window openings are needed; or for the thickness of walls of outbuildings.

Again, the ordinary clauses for the laying-out of roads do not permit of the class of roads which have been designed in some garden cities, neither do they differentiate between the type of paving needed for varying grades of roads or for exceptional arrangements which are demanded in certain cases by the configuration of the ground.

What form should modernising take? Take the question of walls, floors, and roofs—that is, to ensure "due stability" in them. Should not the knowledge of the behaviour of materials be utilised in determining the various sizes of the respective parts rather than tabulated sizes of the thickness of each wall or of the materials being set out in the form of a by-law? For example, the present Model Code prescribes that buildings shall be enclosed with walls, termed external, party, cross, or return walls, constructed of hard, incombustible materials, such as good bricks, etc., and then proceeds to give the thicknesses of the walls according to the particular height the wall is to be erected, neglecting entirely whether any loads were to be transmitted to such walls from floors or subsequent loading when in use.

In this matter of loading it is common practice to find that the joists of buildings of the cottage type were rarely built into party-walls, but often are supported upon a wall half-brick in thickness and an external wall, the thinner wall thus carrying a greater proportion of the weight of the building than the thicker external wall. Obviously such an external wall, if built of the by-law thickness, might be either too thick when not loaded or too thin when loaded. The code does not recognise a wall half-brick in thickness, nor does it, under such conditions as here mentioned, prohibit its use. Another fallacy is where almost the whole of a story is required as an opening. The code here requires sufficient piers to be provided, or in some cases story posts, but never states what a sufficient pier or story post is, or how such is to be determined.

Again, modern buildings of the warehouse type are rarely simple in construction. They are often built upon highly valuable land, which leads to a varying distribution of the loads supported by the floors, whose strength has to be determined by the loading circumstances of each particular case. To apply a model code based upon a universal system of high loading to such buildings would result in unnecessary expense being incurred in the thickness of the walls or strength of the floors, without necessarily providing uniformity of strength throughout the building.

Therefore, if full advantage is to be taken of this opportunity to revise an existing code

of by-laws, consideration should be given to the desirability of including in the revised code power to determine that the various parts of at least buildings of the "public or warehouse" class should be so designed that when loaded as intended the buildings would be in equilibrium throughout. Obviously much care would be needed to draft governing regulations. The following points, however, might form the subject of consideration:—

(1) The type of building and the purpose for which it would be erected.

(2) The type of material to be used in its erection.

(3) The maximum stresses permitted in such materials.

(4) The method of calculation to be followed in determining the resistance of the materials, and the effect of the loading on the various parts for the determining of both external and internal forces.

(5) The extent of the details required from the building owner to enable the local authority to be satisfied that due stability would be obtained, and the nature of the declaration that the building would be duly supervised during construction.

(6) The nature, type, and extent of the tests to be made during and after erection to ascertain that the above conditions were fulfilled.

(7) The guarantee that the building would not be internally stressed to an extent exceeding the designed resistance.

Some such regulations would at once provide all the power that a local authority needed to ensure "due stability" in every portion of buildings other than those of the domestic type, and would remove from the code all those cumbersome rules respecting thickness of walls and their attendant variations consequent upon some contingency often more or less remote.

In matters of means of egress, disposition of seating in public assembly-rooms, position of staircases, situation and type of sanitary accommodation in buildings, all could be more usefully regulated by taking into account the type of construction of the building, as well as the nature of the business or undertaking to be carried on therein. What always obtains under the Model Code is that a minimum of structural stability, based upon an ordinary use, is prescribed; and this becomes in practice an actual maximum.

Domestic buildings would require different treatment to public or warehouse buildings. They are subject to greater changes and different usage. Yet modernising even in their "structural stability" by-laws is possible. Why should walls require footings if resting upon sufficient concrete or rock foundation? Why should parapet walls be needed, with all the risk of conveying moisture into the houses? Why should window-frames be required to be set back $4\frac{1}{2}$ in. from the face-line of buildings? Why should overhanging eaves be prohibited, considering all the protection from dampness they afford to the walls beneath them? Many other questions could be usefully asked by those revising by-laws.

And the inquiry could be carried on throughout those by-laws which are made for "purposes of health." Why should isolating traps, with their ground-level inlets, be demanded? Why should not power be obtained to enable a regulation to be made governing the cubic contents of a room and prescribing the ratio between height, length, and width of all living-rooms, instead of the present one dealing only with height? Should not a regulation be possible requiring all dwelling-houses to be provided with a pantry or larder, and also that all living-rooms should have at least one window in them through which the sunlight can pass every day the sun shines? By-laws dealing with the construction, direction, width, length, and paving of streets should be carefully considered. Should not regulations be made enabling the owners of streets to complete them with dustless paving rather than with the ordinary sett paving, which is often laid with open insanitary joints?

The limitation of the number of houses or other buildings in a row should be considered, and rules prescribed to direct that the course of streets should be such as to enable the maximum amount of sunlight to pass into the buildings erected upon their sides; and to further make provision for the encouragement of open spaces at the front in addition to the land set apart for street purposes, the latter of which might be reduced in width if additional space were provided for use as garden land in front of buildings. Some balancing clauses, whereby this type of laying-out would be made possible, would have an encouraging effect upon the minds of persons who would be considering the development of land, especially if the effect of the clause would be to reduce the cost of street works, which oftentimes are greater than the value of the land for which the works are undertaken.

Many other points might be adduced to show the need of modernising, but one question should be kept foremost in the mind of those considering the subject, and this is it: That the local circumstances should be fully considered before determining the phrasing of any particular regulation.

ADDITIONS TO BUILDINGS AT THE ROYAL BOTANIC GARDEN, EDINBURGH.

THE Town Clerk of Edinburgh has prepared a Report with reference to the additions to the buildings at the Royal Botanic Garden in regard to which differences have arisen between the Corporation of Edinburgh and the Board of Works in consequence of the line of the new buildings having been made to project about 18 ft. beyond the building line of the street. Sir Thomas Hunter points out that the Corporation objected to the encroachment, objection being mainly founded on public policy, but partly also on legal grounds. The objections were stated:—(1) Incongruity of surroundings (the new building is constructed of brick harled with stone facings, while hitherto Government buildings in Edinburgh have been substantial, dignified, and appropriate); (2) projection beyond the general building line; and (3) that the building presents an obstacle to the future widening of the street. The Board of Works now propose completing the extension of the laboratories, and the legal aspect of the Corporation's objection refers to this proposal. In the litigation which had taken place in the Court of Session between the Corporation and the Crown the Lord Ordinary had held that the Commissioners were subject to the 30-ft. line restriction, but the First Division held the opposite opinion. Even a successful appeal to the House of Lords would not assist the Corporation already erected. It would, however, mean less expense to the Corporation when they came to widen the street, if they had to deal with one building rather than with two, and the question was whether by arrangement the whole building might not even yet be kept back. It was regrettable that the Government should have insisted on erecting buildings in opposition to the wishes of the Dean of Guild Court and Town Council when there was no necessity for such a step.

According to the *Scotsman*, members of Edinburgh Town Council were in receipt of a letter on the 10th inst. from Mr. C. E. Price, M.P., which confirms the statements made regarding the possibility of an amicable settlement of the difficulties between the Office of Works and Edinburgh Corporation regarding the building line at the Botanic Gardens. Mr. Price asks the members to give the matter their careful consideration before next Council meeting, as Lord Beauchamp, the First Commissioner of Works, is anxious to get the matter settled as quickly as possible. The letter relates that the Parliamentary representatives of Edinburgh and other members connected with the city met Lord Beauchamp. His Lordship's difficulty, previous to the letter, was in getting the Treasury to spend money in pulling down the building it had so recently erected. After considerable discussion the following suggestion was made:—That the Town Council be at the expense of taking out the front portion of the present building and setting it back to the line desired. This could be done without materially altering the building as a whole, and would not involve a large expenditure of money, as the frontage and the rooms adjoining it are of such a nature that this proposal could easily be carried out. If this proposal is agreed to it would leave the Office of Works free to amend their plans for the new building, so as to find accommodation for the classrooms destroyed. It will necessarily involve the

Treasury in an increased expenditure, but there would be less difficulty in securing this than the former proposal to share the expenditure upon the buildings as a whole. Apart from the particular buildings concerned, other and more extensive proposals are under consideration by the Department, which, if carried out, will greatly increase the amenities of the Botanic Gardens.

REGISTRATION OF PLUMBERS.

THE General Council for the National Registration of Plumbers met last week at the Council House, Bristol. The High Sheriff (Mr. R. E. Bush) presided in the absence of the Lord Mayor. Representatives of public authorities and plumbers were present from all parts of the kingdom. In the course of the proceedings the Council adopted the recommendation of a Committee that, "In order that the public may have greater security for the efficiency of the sanitary appliances and water services in their houses, the work connected with such appliances and services may be so marked by registered plumbers that the names of the master plumbers, or other employers, and also of the operative plumbers employed to execute the work, may be identified and recorded, and a check may thus be placed on the employment of unqualified or irresponsible persons to execute plumbers' work." At the conclusion of the Conference the Chairman, Mr. H. D. Searles-Wood, F.R.I.B.A., made a statement with regard to the position of the building trade and the National Insurance Act, in which he said that one of the most important functions of the Act was the improvement of the public health. *Inter alia*, the Act empowered the Insurance officers to arrange for the testing of the skill and knowledge of any insured workman whose repeated failure to obtain or retain employment appeared to be due to defects in those respects, and in suitable cases to pay out of the employment fund all or any of the expenses incidental to the provision of his instruction. If that was construed, as it was anticipated to be construed, in its relation to the public health, the test and instruction of the plumber would call for the consideration of the General Council of the National Registration of Plumbers.

IMPROVED FIRE-ESCAPES FOR NEW YORK BUILDINGS.

THE question of improving fire-escape facilities in New York has recently been under consideration by the Bureau of Buildings under the direction of Mr. Rudolph P. Miller, the Superintendent. In New York the ordinary means of escape generally consists of a series of iron balconies at the several stories, connected by stairs and provided with a hinged ladder that can be let down from the lowest balcony in case of need. As such ladders are often found to be too heavy for manipulation by persons requiring to use them, it is now proposed that they shall be balanced with a counterweight and furnished with guides. In buildings with a large number of occupants balanced iron stairs are recommended instead of ladders. One advantage of balanced ladders or stairs is that the height of the lowest balcony above the street may be considerably increased. The capacity of exterior fire-escapes has been greatly increased in some cases by arranging two intersecting stairs in the form of a letter "X" between successive balconies.

GENERAL BUILDING NEWS.

CHANCEL, CHURCH OF ST. LEONARD, MUNDFORD. The chancel of the ancient church of St. Leonard, Mundford, Norfolk, has been reopened after restoration. Among the features of the work is a rood-screen, completing the old XIVth-century screen, and supporting the new organ in its carved case. The interior of the new roof of the chancel is treated in blue and gold, as is the Early English masonry of the east window. The alabaster reredos, containing the Crucifixion and eight other carved figures, is also treated in colour. Mr. J. N. Comper is the architect.

CHURCH, EDINBURGH.

A new church, situated at the west end of Rose-street, has been erected on the site of the old Charlotte Church. The new building, providing accommodation for 950 people, is in the Renaissance style, in harmony with the adjacent architecture of Charlotte-square. The two principal entrance doors are placed in the centre of the Rose-street front, and give access to the main entrance vestibule, which

extends the entire width between the principal staircases. The lower hall is specially arranged for Sunday-school work. The main auditorium is the baptistry, which sunk level with the platform. The gallery extends along the north, east, and west walls. An upper hall is centrally placed on the floor. This hall accommodates some 500 people, while in the basement hall accommodation is provided for between 400 and 500 people. There are also various other rooms including a business-room. The joint architects of the new building are Mr. James Arnott, of Messrs. Sydney Mitchell & Wilson, and Mr. J. Inch Morrison, Edinburgh.

ENLARGEMENT OF GABALTA CHURCH.

It is proposed to enlarge St. Mark's Church, Gabalfa. The plans, prepared by Mr. E. Vaughan, and approved by the Incorporated Church Building Society and the Llandudno Church Building Society, will increase the accommodation by 270 sittings, at a cost of 2,500. The first section takes the form of a new north aisle, the extension of the north-westward, and the provision of an organ chamber and heating cellar. By the second section of the proposed additions, which will be commenced as soon as funds are forthcoming, it is intended to add a south aisle, a new chancel with ambulatory, and a new vestry and choir vestries, and a tower at the west end. The total accommodation to be provided is 649 sittings, and the estimated cost of the whole scheme is 5,500. This includes the tower, 20 ft. in base and rising to a height of 70 ft. to the parapet.

CHURCH, LANGLEY MILL.

The new Church of St. Andrew, Langley Mill, has just been consecrated by the Bishop of Southwell. The church has been erected at a cost of 6,300. It is built in the Gothic style of Derbyshire stone, and contains a nave and south aisle and a south transept, with a tower, and a lady chapel. The timber-work is of English oak. The total length of the church is 120 ft. and the breadth 52 ft. and the tower 56 ft. The architect is Mr. J. S. Brooklesby, of Merton, Surrey. The church has seating accommodation for 500.

NEW HALLS, YORKER PARISH CHURCH, NEW GLASGOW.

The new halls in connexion with York Parish Church were formally opened on Saturday last. The halls have been erected from the designs of Mr. H. D. Walton, architect, at a cost of about 1,700. The large hall provides accommodation for 420 persons.

ST. JAMES'S (CHURCH OF SCOTLAND), EAST DUNDEE.

A bronze tablet to the memory of the Alderman John Somerville was unveiled in the church on the 10th inst. by the Mayor of Dundee (Alderman W. Breckinley, J.P.). The tablet is designed in the late Gothic manner. Spandril shields show the arms of St. James and St. Andrew, and floral ornament, which is sparingly introduced, is based on this. The inscription is enclosed within a cusped arch and surmounted by cross and crown. The tablet was modelled and cast by Messrs. H. W. Cashmore & Co. of Victoria-street, S.W., from the design and details of Mr. A. J. Clifford Esq., Lic.R.I.B.A., East Dulwich-road, S.E.

HIGH SCHOOL FOR GIRLS, KIDDERMINSTER.

The Countess of Dudley recently opened a high school for girls which has been erected by Worcester-shire County Council at Kidderminster. The school stands on a site which was formerly formed part of the Hill-grove Estate. The building is built of red brick, with dressings, and accommodates 200 students. There are eight classrooms, with art, music, laboratory, and lecture-rooms. A caretaker's house has also been erected. The total cost of buildings and equipment is about 10,000 exclusive of the site. Mr. J. Bridgewater, Cradley Heath, has been the contractor, and Messrs. Ritchard & Pritchard, of Kidderminster, the architects.

GEORGE HERIOT'S SCHOOL, EDINBURGH.

New science laboratories have been erected and added to the school at a cost of about 15,000. The new building is 175 ft. in length and three stories high, and contains geographical lecture, apparatus, preparation, master electrical research, dynamics, and other rooms. Electric light has been installed throughout, and the plans for the new works were prepared by Mr. John Anderson, superintendent of works for George Heriot's Trust.

COUNCIL SCHOOL, DALLAS-ROAD, LANCASTER.

The opening of the new Council School in Dallas-road, Lancaster, took place on the 8th inst. The new schools will take the place of the Sulyard-street Council School. The work in the designing and execution of the plans, says the *Lancashire Daily Post*, has been

led out by the Borough Surveyor, Mr. C. Bradshaw. The school is one of the designed with a detached or insulated hall. The Board of Education had the ordinary central hall type of school built to ventilate, and when used for singing will disturb the work in the classrooms. There will be through ventilation for classrooms and central hall by the plan adopted. The school is designed to accommodate 940 pupils, but as it will be also used as a room for manual training, cookery, and sewing, the total accommodation is for 1,000 pupils. The building is Renaissance in character. The basement will be used for manual training, cookery, and laundrywork. There is also provision for practical geography. The first floor will be utilised in summer as an air school. The hall is 61 ft. by 30 ft., is provided with a gallery at one end. The first floor is provided for. There is also the first floor of the junior school, with south aspect. There is also on the same floor head-rooms, a kitchen, a lavatory, and a storeroom. There is also a south aspect. Provision is made for science teaching and practical geography in this department. For the senior school, chairs are provided at their desks. By having a sliding partition, a music-room will be provided. Of the many classrooms there are only two provided with a north aspect, these are made especially light. Staffs are provided on each floor. There are also lavatories provided. The total cost of the school is about 14,000.

SCHOOL, GILMERTON, EDINBURGH.

Plans prepared by Mr. Inch Morrison, architect, Edinburgh, for a school to replace the old Female School, Gilmerston, have been adopted by the School Board. The school will accommodate 400 pupils.

PORTOBELLO TOWN HALL.

Edinburgh Dean of Guild Court, Edinburgh Corporation were granted warrant to build a Town Hall for Portobello. The new hall will face the High-street, and is designed to accommodate 600 people in the area and over 500 in the gallery. The platform will be about seventy people, and the whole building has been designed to suit operatic, theatrical, and similar forms of entertainment. In addition to the main hall there will be a kitchen, a lavatory, a bar, and a refreshment room. There will be crush halls at entrance, and corridors will run along the sides of the area for the freer movement of the patrons. The building, the front of which is to be of stone, will be set back from the High-street a distance of 45 ft., so as to be a drive in at each side of the main entrance. The cost of the Town Hall will be about 6,000. The plans have been prepared by Mr. Williamson, the City Architect.

NEW PAVILION, CARNOSTIE, N.B.

The Carnoustie Pavilion was opened on Friday last in Park-avenue, one of the main streets between the High-street and the sea. The hall is 45 ft. wide by 65 ft. long, has a seating capacity for about 900 people. The gallery is constructed on the cantilever principle, the holding capacity being about 200. There is a promenade along the back, which will accommodate nearly 200 people. The main front is finished in white Portland stone. The building has been erected from plans under the special supervision of Mr. P. Swanson, architect, Kirkcaldy, and the building will be between three and four thousand pounds. The contractors for the work were: Messrs. John Carnegie, Barry, joiners; Mr. J. Stewart & Sons, Dundee; iron and steelwork, Messrs. P. & W. McLellan, Ltd., Glasgow; plumber-work, Messrs. J. Farquhar & Son, Carnoustie; asphalt, Vulcanite, Belfast; slater-work, Messrs. Alexander & Sons, Carnoustie; plasterers, Messrs. James & P. Dundee; glaziers, Messrs. Gray & South, Dundee; heating, Messrs. Watt & Martin, Kirkcaldy; electric installation, Mr. J. B. Robertson, Edinburgh; rator, Mr. E. Mathewson, Carnoustie; engine and dynamo, Messrs. Morrison & Glasgow.

TRADE NEWS.

Under the direction of Mr. Robert Lynn, architect, Belfast, the "Boyle" system of dilution (natural), embracing Boyle's latest "air-pump" ventilators and air-inlets, has been applied to Warrington Female School. The Spittesloe Hospital, Luton, is being fitted with Shorland's warm-air ventilating plant at Manchester stores, with descending flues and patent exhaust roof ventilators, by Messrs. H. Shorland & Brother, of Failsforth, Manchester.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Projections.

Chelsea.—Erection of a projecting hood over the entrance to a house on the north-western side of Mallord-street, Chelsea (Mr. W. D. Caroe for Mr. P. Morris).—Consent.

Chelsea.—Erection of a projecting clock at No. 51, Sloane-square, Chelsea (Greenwich Time, Ltd., for Victualers, Ltd.).—Consent.

Deptford.—Erection of a urinal at the rear of the "Black Horse" public-house, No. 195, Evelyn-street, Deptford, to abut upon Hood-street (Messrs. Truman, Hanbury, Buxton, & Co., Ltd., for Mr. Capon).—Consent.

Fulham.—Erection of a two-story addition to the Burlington Laundry, Rigault-road, Fulham (Mr. J. Coddington).—Refused.

Hackney, South.—Erection of a building to abut upon the southern side of Leagrave-street and the eastern side of Chatsworth-road, Hackney (Mr. C. W. Hodgson for Messrs. Brook & Sons).—Consent.

Hammer-smith.—Erection of a cinematograph theatre to abut upon the western side of Queen-street and the southern side of Bridge-street, Hammer-smith (Messrs. F. Marcham & Co.).—Consent.

Hampstead.—Erection of an iron and glass porch in front of No. 61, Compayne-gardens, Hampstead (Messrs. L. Solomon & Son for Mr. M. Samuel).—Consent.

Kensington, North.—Erection of a porch at No. 13a, Penbridge-place, Notting Hill-gate (Mr. J. S. Beard).—Consent.

Kensington, North.—Re-erection of an iron and glass covered way at No. 14, Ladbroke-road, Notting Hill-gate (Mr. W. Willett for Mr. E. W. Martelli, K.C.).—Consent.

Kensington, South.—Addition at No. 128, Church-street, Kensington (Messrs. Chesterton & Sons).—Consent.

Kensington, South.—Porch and balcony at No. 5, Holland-park, Kensington (Messrs. Kemp & How for Mr. O. Gerdes-Hansen).—Consent.

Kensington, South.—Projecting hood at No. 18, Victoria-road, Kensington, next to Douce-place (Messrs. W. Whiteley, Ltd., for Sir Algernon Willoughby Legard, Baronet).—Consent.

Lewisham.—Addition in front of Stanstead Lodge, Northwood-road, Catford (Mr. A. Sykes for Mr. H. Gardner).—Consent.

Lewisham.—Erection of porches to four houses on the southern side of High-road, Lee, westward of Rembrandt-road (Mr. A. S. Gover for the House Property and Investment Company, Ltd.).—Consent.

Lewisham.—Erection of a building on the southern side of High-road, Lee, to abut upon Rembrandt-road (Mr. A. S. Gover for the House Property and Investment Company, Ltd.).—Consent.

Lewisham.—Erection of a projecting one-story shop in front of No. 6, Howarth-road, Catford (Mr. J. H. Beesley for Mr. F. Corbett).—Consent.

Lewisham.—Erection of eleven houses on the eastern side of Muirkirk-road, Catford, with flanks abutting upon Braidwood-road and Downhill road (Mr. R. Stewart for Lord Rowallan).—Refused.

Marylebone, East.—Erection of balconies in front of Nos. 179, 181, 183, and 185, Great Portland-street, St. Marylebone (Mr. R. Angell for Mr. C. E. Peczenik).—Consent.

Marylebone, East.—Erection of Nos. 216 and 218, Great Portland-street, St. Marylebone, with projecting bay-windows (Mr. F. T. Verity).—Consent.

Norwood.—Erection of Nos. 25 to 43, odd numbers only (inclusive), Doverfield-road, Brighthelm, with bay-windows, oriel-windows, and porches (Mr. Macintosh).—Consent.

Norwood.—Erection of bay-windows and balconies at Nos. 26 and 28, Rosendale-road, Dulwich (Mr. D. W. Chapman de Louth).—Consent.

Paddington, North.—Re-erection of projecting entrance steps and the erection of a projecting balcony at Welford's Dairy, Shirland-road, Paddington (Messrs. Harvey & Potter for Messrs. Welford & Sons, Ltd.).—Consent.

Paddington, South.—Retention of two oriel-windows at No. 23, Sussex-square, Bathurst-street, Paddington (Messrs. T. W. Hoath & Son).—Consent.

St. Pancras, North.—Erection of a flight of steps leading from the pavement to the basement level in front of No. 5, Highgate-road, St. Pancras (Mr. J. L. Worsell for Court "Purveyance," of the Ancient Order of Foresters).—Consent.

St. Pancras, South.—Projecting sign in front of No. 170, Tottenham Court-road, St. Pancras (Mr. P. J. Stannard).—Consent.

Strand.—Projecting sign in front of Tottenham Court-road Tube Railway Station, Oxford-street (Mr. E. P. Grove for the Central London Railway Company).—Consent.

Wandsworth.—Erection of houses with bay-windows and porches on the southern side of Hotham-road, the northern side of Clarendon-road, and both sides of a new road out of the southern side of Hotham-road, Wandsworth (Mr. A. Dawkins for Mr. R. B. Mason).—Consent.

Wandsworth.—Erection of a projecting sign at No. 186, Balham High-road, Wandsworth (Mr. R. S. Powell for Messrs. Herbert Clarke, Ltd.).—Consent.

Westminster.—Retention of an iron and glass hood at No. 16, Charles-street, Knightsbridge (Messrs. F. A. Shepherd & Sons).—Consent.

Whitechapel.—Erection of a bay-window in front of No. 15, Great Princes-street, Whitechapel (Mr. B. J. Capell for Messrs. Truman, Hanbury, Buxton, & Co.).—Consent.

Whitechapel.—Erection of a projecting clock in front of No. 1, Goulston-street, Whitechapel (Greenwich Time, Ltd., for Victualers, Ltd.).—Consent.

Woolwich.—Bay-windows at Nos. 68 to 76, even numbers only (inclusive), Dungeon-road, Eltham (Mr. J. J. Bassett for Lord Rowallan).—Consent.

Woolwich.—Erection of porches and bay-windows to ten houses on the western side of Rochdale-road, Plumstead (Mr. T. G. Arnold for the Royal Arsenal Co-operative Society, Ltd.).—Consent.

Woolwich.—Erection of three buildings on the northern side of Bexley-road, Woolwich, with flanks abutting upon Greenhoolm-road and Elderside-road (Mr. R. Stewart for Lord Rowallan).—Refused.

Width of Way.

Bethnal Green, South-West.—Erection of a building at Nos. 11-15, Satchwell-street, Bethnal Green-road, Bethnal Green, and to the omission of a layer of concrete over the site (Mr. W. W. Beaumont for Mr. E. Sherry).—Consent.

City of London.—Erection of a porch in front of the Dutch church, Austin Friars, City (Sir Alexander R. Stanning).—Consent.

City of London.—Re-erection of No. 67, Lombard-street, City (Mr. H. L. Anderson for Messrs. Glyn, Mills, Currie, & Co.).—Consent.

Finsbury, Central.—Erection of a building to abut upon Skinner-street and Good-street, Clerkenwell (Mr. F. D. Smith for the People's Picture Playhouse, Ltd.).—Consent.

Greenwich.—Erection of a building on the northern side of Wood Wharf, Greenwich (Mr. A. Roberts for the Anglo-Swedish Electric Welding Company).—Consent.

Greenwich.—Retention of a boundary at less than the prescribed distance from the centre of the adjoining footways in connexion with the proposed erection of buildings upon a site on the southern side of Kidbrooke-gardens, Blackheath (Mr. A. Griffin).—Consent.

Paddington, South.—Erection of a building on the eastern side of Polygon-mews, Paddington (Mr. W. H. Burt for Messrs. A. Turner & Co.).—Consent.

Peckham.—Retention of pavement lights and vaults at Nos. 11 and 13, Sylvan-grove, Old Kent-road, Peckham (Mr. W. C. Symes for Messrs. Henderson & Spalding).—Consent.

Southwark, West.—Erection of a building upon a site abutting upon Cathedral-street and Winchester-square, London Bridge (Mr. M. W. Mats for the proprietors of Hay's Wharf).—Consent.

Width of Way and Lines of Frontage.

Hoxton.—Erection of a block of buildings upon the site of No. 13, Dereham-place, and Nos. 4, 5, and 6, Norfolk-gardens, Curtain-road, Hoxton (Messrs. Lovagrove & Papworth for Mr. L. Eison).—Consent.

St. Pancras, South.—Erection of a building upon a site abutting upon Mabledon-place, Bidborough-street, and Hastings-street (Mr. W. H. Woodroffe for the National Union of Teachers).—Consent.

Wandsworth.—Retention of a urinal at the rear of the "Duke of Devonshire" public-house, Balham High-road, Wandsworth, next to Balham New-road (Mr. J. Fleming).—Consent.

Width of Way and Construction.

Bethnal Green, North-East.—Erection of a building of a temporary character at the rear of No. 278, Globe-road, Bethnal Green, next to Gauber-street (Messrs. Wilkinson & Wilkinson for Dr. J. A. Guinness).—Refused.

Wandsworth.—Retention of a cycle shed of a temporary character at the rear of "The Corner Pin" public-house, Summerstown (Mr. E. Penn for Mr. H. Washington).—Consent.

Lines of Frontage and Construction.

Deptford.—Building of a temporary character at No. 2, Truvellys-road, Deptford (Mr. W. Gilson).—Consent.

Dulwich.—Temporary motor-car shed at the rear of No. 100, Alley-road, Dulwich, next to South Croxted-road.—Consent.

Greenwich.—Wood and iron building of a temporary character at the corner of Woolwich-road and Westcombe-hill, Greenwich (the London and Counties Tradesmen's Association).—Consent.

Hackney, Central.—Three buildings of a temporary character at the rear of No. 62, Downham-road, Hackney, next to Culford-road (Mr. W. Peall).—Consent.

Hackney, Central.—Showcase on the forecourt of No. 100, Clarence-road, Hackney (Messrs. Eintracht & Merland).—Consent.

Hackney, Central.—Wood and glass showcase on the forecourt of No. 54, Mare-street, Hackney (Mr. W. E. Hinton).—Consent.

Hackney, North.—Temporary coal office at No. 43, Stamford-hill, Hackney (Messrs. A. W. Osment & Co., for Mr. H. F. Stanley).—Consent.

Hackney, South.—One-story addition and a water-closet building of a temporary character at No. 95, Rushmore-road, Hackney, next to Elderfield-road (Mr. J. Codrington).—Consent.

Lewisham.—Motor-house of a temporary character at No. 2, Brandram-road, Lee (Messrs. Harrison & Co., for Mrs. T. Downe).—Consent.

Lewisham.—Retention of a temporary wood and iron building at "Holmleigh," Baring-road, Grove Park (Mr. H. Le Forester).—Consent.

Lewisham.—Retention of a wood and iron building at No. 222, Verdant-lane, Hither Green (Mr. A. O. Harrison).—Refused.

Peckham.—Temporary wood and iron show building, used as an office, at Nos. 761 and 763, Old Kent-road, Peckham (Messrs. W. Cooper, Ltd.).—Consent.

Line of Frontage and Space at Rear.

Hackney, North.—Erection of an addition in front of a house on the southern side of Springfield, Upper Clapton, eastward of No. 8, and to the irregular open space at the rear of such house (Messrs. Bannan & Rowe for Dr. F. E. Turner).—Consent.

Hackney, Central.—Retention of a lean-to shed at the rear of No. 519, Mare-street, Hackney, abutting upon the northern side of Sylvester-road (Mr. J. H. Rogers for Messrs. F. Bax & Son, Ltd.).—Refused.

Width of Way, Deviation from Certified Plans, and Cubical Extent.

St. George, Hanover-square.—Garage building in Pembroke-mews, Halkin-street, Westminster (Mr. E. Wimperis for Messrs. Rawlings Brothers, Ltd.).—Consent.

Width of Way and Working-Class Dwellings.

Chelsea.—Erection of blocks of intended dwelling-houses to be inhabited by persons of the working-class, upon a site abutting upon the western side of Leader-street, the north-eastern side of Pond-place, and the south-western side of College-street, Chelsea (Messrs. Joseph & Smith).—Consent.

Space at Rear.

Greenwich.—Erection of a building on the western side of Blackwall-lane, Greenwich, with an irregular open space at the rear (Mr. A. Roberts for the Guardians of the Greenwich Union).—Consent.

Hackney, South.—Erection of lock-up shops on the southern side of Lea Bridge-road, Hackney, eastward of Lower Clapton-road (Messrs. Moon & Ballinger).—Consent.

Hoxton.—Erection of a water-closet building upon the flat at the rear of No. 209, Kingsland-road, Hoxton (Mr. R. S. Powell).—Consent.

Paddington, South.—Building upon the site of Nos. 81 and 83, Edgware-road, Paddington, next to Cambridge-street, with an irregular open space at the rear (Mr. P. W. Davis for Mr. E. Tombs).—Consent.

St. George, Hanover-square.—Erection of a building abutting upon Warwick-row, Princess-row, and Brewer-street, Westminster (Messrs. A. E. Hughes & Son for Messrs. F. Gorringer, Ltd.).—Consent.

St. George, Hanover-square.—Addition at the fourth-floor level of No. 15, Clarges-street, St. George, Hanover-square (Mr. E. Keynes Purchase).—Consent.

Strand.—Erection of a building at Nos. 13 and 14, Archer-street, W., with an irregular open space at the rear (Messrs. H. P. Adams and C. Holden).—Consent.

Space at Rear and Construction.

Kensington, North.—Erection of an open shed and trellis-work on the roof of the back addition of Nos. 11-13, Lansdowne-road, Kensington (Mr. E. W. Marshall for Mr. E. Davis).—Consent.

Deviation from Certified Plans.

Kensington, North.—Re-erection of No. 1, Ladbroke-terrace-mews, Kensington (Messrs. Stock, Page & Stock for Mr. L. O. Engleton).—Consent.

Height of Buildings.

Hackney, North.—Erection of an addition to a warehouse building on the northern side of Arcola-street, Hackney (Mr. M. Miller).—Consent.

Westminster.—Erection of a building to abut upon the northern side of Matthew Parker-street and the southern side of Lewisham-street, Westminster (Mr. H. Chatfield Clarke for Sir Robert Perks, Bt.).—Consent.

Separation and Alteration of Building.

City of London.—Alterations at No. 158, Bishopsgate, City (Mr. F. Sherrin for Messrs. Lockharts, Ltd.).—Consent.

Building for the Supply of Electricity.

Norwood.—Erection of a two-story addition to be used as a store, a one-story lavatory addition, and an external steel and concrete gangway at the premises of the South London Electric Supply Corporation, Ltd., Bengeworth-road, Loughborough-junction (Messrs. F. & H. F. Higgs for the South London Electric Supply Corporation, Ltd.).—Consent.

Alteration of Buildings.

Hampstead.—Additional story to a bay-window at the rear of No. 117, Broadhurst-gardens, Hampstead (Messrs. W. & E. Hunt).—Consent.

St. Pancras, East.—Erection of an addition at the rear of No. 240, Camden-road, St. Pancras (Mr. H. Goodchild for Mr. Windus).—Consent.

St. George, Hanover-square.—Additional cubical extent in respect of the rebuilding of the premises of Messrs. Wimbush & Co., Pembroke-mews and Belgrave-mews East, St. George, Hanover-square (Mr. E. A. E. Woodrow).—Consent.

St. George, Hanover-square.—Alterations and additions at Nos. 162 and 163, Grosvenor-road, Piccadilly, whereby the cubical extent of the premises will exceed 260,000 cubic ft. (Mr. E. G. Hammond for Messrs. Theo. Masui, Ltd.).—Refused.

Stepney.—Alterations and the erection of an addition to the bottling store at the premises of Messrs. Mann, Crossman, & Paulin, Ltd., Russell-street, Mile End (Mr. W. Stewart for Messrs. Mann, Crossman, & Paulin, Ltd.).—Consent.

Uniting of Buildings.

Chelsea.—Formation of openings exceeding the statutory size in division walls at the premises of Messrs. Harvey, Nichols, & Co., Ltd., Knightsbridge, and to the use of double rolling steel shutters in lieu of double iron doors to such openings (Mr. F. E. Williams for Messrs. Harvey, Nichols, & Co., Ltd.).—Consent.

City of London.—Uniting of Nos. 44-46, Barbican, and No. 7, Bridgewater-street, City, by means of an opening at the ground floor level (Mr. G. Vickery).—Consent.

Holborn.—Retention of openings in a party wall at Nos. 235 and 236, Tottenham Court-road, Holborn (Messrs. F. J. Eadie & Meyers for Messrs. Flower & Sons, Ltd.).—Consent.

Islington, East.—Uniting of Nos. 2 and 3, Clarendon-buildings, Horsell-road, Highbury (Mr. W. H. Hillyer for Messrs. J. Timpson & Co.).—Consent.

Kensington, South.—Double armoured doors in lieu of double iron doors to openings in a division wall at the premises of Messrs. Derry & Toms, Kensington High-street (Messrs. Mather & Platt, Ltd., for Messrs. Derry & Toms).—Consent.

Kensington, South.—Erection of an iron and glass roof over a portion of the passage-way, at present unenclosed, leading to the Kensington High-street Station of the Metropolitan District Railway, and between the premises of Messrs. Ponting's, Ltd. (Messrs. John Barker & Co., Ltd.).—Refused.

Peckham.—Opening with steel sliding doors in the party wall between Nos. 11 and 13, Sylvan-grove, Old Kent-road, Peckham (Mr. W. C. Symes for Messrs. Henderson & Spalding).—Consent.

St. George, Hanover-square.—Formation of openings in the party wall at the basement and ground-floor levels between No. 6, Pollen-street, and No. 14, Hanover-street, St. George, Hanover-square (Mr. Delissa Joseph for Messrs. Weekes & Co.).—Consent.

St. Pancras, South.—Formation of an opening of greater width and height than specified in the said section in a party wall at premises abutting upon Gough-street and Phoenix-place, St. Pancras (Messrs. Holman & Goodham for Messrs. A. W. Gamage, Ltd.).—Consent.

The recommendations marked * are contrary to the views of the Metropolitan Borough Councils concerned.

PROJECTED NEW BUILDING IN THE PROVINCES.*

ABERDEEN.—Two houses (585L.); Mr. W. H. Lee, builder, Hengood, *via* Cardiff.

Aberdeen.—Additions to factory (3,000L.). Rose-street, for Messrs. Harroft & Co., hosiery manufacturers; Messrs. Jenkins & M. architects, 16, Bridge-street, Aberdeen.

Accrington.—Extensions to Victoria Mill for Messrs. R. Holt & Co., Ltd., cotton spinner.

Apperley Bridge.—Pumping-station; Mr. Garfield, Sewage Works Engineer, Tynm Hall, Bradford.

Ayr.—Cold storage building, Mill-street (1,500L.), for Messrs. Murray & Sons; Mr. V. Cowie, architect, Alloway-chambers, Ayr.

Bangor.—Workhouse infirmary (17,580L.). Messrs. W. Thornton & Sons, builders, 3, Wellington-road, Toxteth Park, Liverpool.

Beckenham.—Plans have been passed for five houses, Arrol-road, for Mr. A. W. Kee and five houses, Shrewsbury-road, for Mr. V. Davies.

Beworth.—Baptist church, Coventry-road (2,350L.); Mr. T. R. J. Meakin, architect, Hertford-terrace, Queen's-road, Coventry; Mr. L. Bunney, builder, Leicester-street, Bedworth.

Bilthorpe.—School (567L.); Mr. J. Green, builder, 2, Wood-street, Mansfield.

Birstall.—Alterations to parish church, *etc.* Mr. G. H. F. Prynn, architect, 6, Queen Anne's-gate, Westminster, S.W.

Bradford.—Additions to milk depot, Morley-street (4,560L.); Mr. Reginald G. Kirkbride, architect, Town Hall, Bradford.

Brickhaven.—School; Mr. G. C. Campbell, architect, Methil-place, Methil, Fifeshire.

Bristol.—Offices, Royal Edward Dock; Mr. L. S. McKenzie, City Engineer, Town Hall, Bristol.

Burbridge.—Additions to factory for Messrs. Robinson Brothers, hosiery manufacturers.

Cardale.—Riding school (3,000L.); Mr. J. V. Bennett, 38, Lowther-street, Carlisle.

Chadkirk.—Extension to warehouse of Messrs. Syddall Brothers, calico printers, 1, The Collier, Printers' Association, Ltd., 1, James'-building, Oxford-street, Manchester.

Cheadle.—School (3,235L.); Mr. W. Alcock, builder, 3, Bank-street, Cheadle.

Chelmsford.—Proposed municipal offices for Mr. C. Brown, Engineer, Town Hall, Chelmsford.

Chester.—Sanatorium (25,000L.); Mr. A. Matthew Jones, Surveyor, Town Hall, Chester.

Chuckery (Walsall).—School; Mr. John Taylor, Surveyor, Town Hall, Walsall.

Cleveleys.—Alterations and extensions to premises for the Cleveleys Hydro, Ltd. (20,000L.).

ple. Barton.—Church institute, Station-
(6,000.); Mr. W. H. Sheffield, architect,
Barton; Messrs. Elson & Knight,
ers, Earls Barton.
ington.—Hospital (12,000.); Mr. H.
y architect, Sunnyside-chambers, West
side, Sunderland.
and.—Factory for Messrs. George Lumb,
cotton spinners, Wellington Mills,
eo-street.
oter.—Headquarters for 7th Battalion
H Devon Regiment; Messrs. Ellis, Son,
nden, architects, Bedford-circus, Exeter;
ra. Soper & Ayres, builders, Magdalen
ch, Exeter. Children's home (7,000.); Mr.
M. Challice, architect, Bedford-circus,
er; Messrs. Soper & Ayres, builders,
aden Bridge, Exeter.
asgow.—Additions to works, Cardonald.
Messrs. Cockburn, Ltd., safety-valve
rs. Alterations to Council Chambers
(4); Messrs. Morrison & Son, builders,
adie-road, Polmadie, Glasgow. Episcopal
ch, Bridgeton (6,000.); Mr. H. D. Walton
West, 218, West Campbell-street, Glasgow.
age for Messrs. Hunter, Barr, & Co.,
esale clothiers, Coburg-street; Messrs. H.
p. Barclay, architects, 245, St. Vincent-
ch, Glasgow. Stores for Messrs. Lowrie &
whisky merchants, 44, Washington-street
(2); Mr. James Erskine, jun., Eskville,
estoun. Proposed church extensions
(000.), for the Glasgow Presbytery of the
ch of Scotland.
oucester.—Infirmary (50,000.); Mr. H.
H. architect, Queen-street, Gloucester;
ard & Son, builders, Stroud-road,
cester.
yvan.—Extensions to Co-operative Society's
shops (3,000.); Mr. James Davidson, 95,
rison-street, Glasgow.
ays.—Enlargement of Arthur-street School
51; Messrs. H. J. Carter, Ltd., builders,
rs.
at Harwood.—School (6,000.); Rev. F.
son, Vicar, St. Bartholomew's Church,
at Harwood.
alfax.—Extensions to Kingston Toffee
s for Messrs. Riley Brothers, manufactur-
confectioners.
rexford.—Cold storage and bacon factory
(4); Messrs. Grooms & Bellington archi-
tects; Messrs. Pollard & Son, builders,
mouth-street, Bridgewater.
ove.—Extensions to police-station; Mr. H.
Scott, Surveyor, Town Hall, Hove.
ucknall Torkard.—Addition to teachers'
ing centre (2,400.); Mr. C. J. Bristowe,
all, architect, Nottingham.
ull.—Alterations to premises, Adelaide-
th, for Messrs. Moore & Robson's
ories, Ltd; additions to premises, Wilde-
st, for Messrs. Reckitt & Sons, Ltd., blue
infactories.
unard's Bog.—Pavilion for the Glasgow
torial Association; Mr. T. Dunoon Rhind,
itect, 28, Rutland-street, Edinburgh.
Inverness.—Extensions to garage (2,000.);
rs. Cameron & Burnett, architects,
demy-buildings, Inverness.
eighley.—House, stables, etc., Farnhill
hill (1,448.); Mr. T. H. Haigh, architect,
Exchange-street East, Liverpool; Messrs.
l & Jamieson, builders, Liverpool.
lanally.—Hall for Boy Scouts (4,000.); Mr.
Ham Griffiths, architect, Falcon Bridge,
ully.
urgan.—Extensions to factory (3,000.); Mr.
Lynn, 13, Ann-street, Belfast.

Manchester.—Thirty houses, Blackley Estate;
Mr. Henry Price, Architect, Town Hall,
Manchester.
Millbridge.—Enlargement of Wesleyan
Sunday-school; Mr. J. W. Burrows, architect,
Mirfield.
Minehead.—Post-office; Messrs. J. Burgess
& Son, builders, Tregonwell-road, Minehead.
Mirfield.—Alterations to Ledgard Bridge
Mills for Messrs. George Lyles & Sons, yarn
spinners.
Molland.—Drill hall, etc.; Messrs. Ellis,
Son, & Bowden, architects, Bedford-circus,
Exeter.

street, Newcastle. Proposed reconstruction of
Town Hall; Mr. F. Holford, Architect, Town
Hall, Newcastle.
New Mills.—Alterations at the Newtown
passenger station for the London and North-
Western Railway Company, Ltd., Easton
Station, N.W.
Newquay.—Ten houses, St. John's-road
(1,500.); Mr. J. Ennor, jun., Surveyor, Council
Offices, Newquay.
Ormskirk.—Electric sub-station and battery-
station for the Lancashire and Yorkshire
Railway Company; Messrs. J. Robinson &
Son, builders, 166, Bursough-street, Ormskirk.
Pentwyn (Aberystwyth).—School; Mr. T. G.
James, County Education Office, Newport.
Peterborough.—Construction of sewage
works (8,752); Mr. C. Chamberlain, builder,
Leicester.
Picking.—Adaptation of temperance hall
into cinematograph theatre; Mr. R. M. Cover-
dale, builder, Bridlington.
Pokesdown.—Fire-station (2,434); Messrs.
Jones & Soward, builders, Seamoore-road,
Bournemouth West.
Pontesford.—Garage and stabling (970);
Messrs. Dickens-Lewis & Haymes, architects,
Talbot-chambers, Market-street, Shrewsbury;
Messrs. Treasure & Sons, Ltd., builders,
Chester-square, Shrewsbury.
Portland.—Pumping-station, etc. (8,163);
Messrs. Jesty & Baker, builders, Castletown,
Portland.
Ravenhead.—Proposed parochial hall for the
Vicar of St. John's Church.
Reading.—Alterations to University,
Whitley; Messrs. C. Smith & Son, architects,
164, Friar-street, Reading.
Rooford.—Alterations and additions, etc., at
infirmary (2,970); Messrs. Myall Brothers,
Connaught-road, Hford.
Rotherham.—Additions at dust destructor
(3,751); Messrs. Heenan & Froude, builders,
Worcester.
Roxton.—Extension to premises for the
Hawk Spinning Company.
Scarborough.—Improvements and alterations
to premises (8,000.) for the Cliff Bridge Com-
pany.
Soulcoates (Hull).—Warehouse for Messrs.
Sissons Brothers & Co., Ltd., oil and whitening
manufacturers, Hull.
Shaw.—Extension to mill for the Hawk Mill
Company, cotton spinners.
Sketty.—Business premises; Messrs. Thomas
Meager & Jones, architects, Wind-street,
Cardiff.
Southampton.—The following plans have
been passed:—Three houses, Janson-road, for
Mr. J. Bowers; additions to Park Hotel,
Slurley-road, and alterations to Richmond
Tavern, Bridge-road, for Mr. A. F. Out-
teridge; alterations to Oddfellows' Hall, St.
Mary-street, for Messrs. Lemon & Blizard;
fourteen houses, Leigh-road, and motor garage,
Cranmere, Highfield lane, for Mr. J. Smith.
A plan has been lodged for four houses off
Highfield-lane for Mr. W. Frank Perkins.
Stafford.—School, Busherry-lane; Mr. G.
Balfour, Education Office, Stafford.
Stalybridge.—Premises, Harrison-street
(1,500.), for the Co-operative Society.
Stamford.—Headquarters for 4th Lincoln-
shire Regiment; Mr. H. F. Traylen, archi-
tect, Broad-street, Stamford.
Stanley.—Cemetery buildings, chapel, etc.;
Mr. J. J. Eltringham, architect, Railway-
terrace, Blackhill; Messrs. Brown & Thomp-
son, builders, Knutsley Guardians, Consett.
Stretford.—Picture hall (1,670); Mr. H.
Booth, architect, 42, Regent-street, Haslingden.
Plans have been passed as follows:—Ten
houses, Derwent-road, for Mr. John Dean; six
houses, Crownwell-road, for Mr. William R.
Bullivant; motor garage, Trafford Park, for
Messrs. Hall & Pickles.
Thornbury.—Enlargement of infirmary
(950); Mr. H. P. Thurston, Clerk, Guardians'
Offices, Thornbury.

Towcester. Seventeen houses (1,710); Mr.
Robert Marriott, builder, Higham-road,
Rushton.
Trafford Park.—Works for Messrs. Turner
Brothers, Ltd., asbestos manufacturers, Roch-
dale.
Tunstall.—Church (6,000.) for the Vicar of
St. Chad's Church.
Twickenham.—A plan has been passed for
alterations to St. Margaret's Laundry, Crown-
road, for Mr. G. L. Alexander.
Wellington.—Additions to workhouse;
Architect, Guardians' Office, Wellington.
West Hartlepool.—Electric power-station;
Messrs. J. W. White & Co., builders, High
Barnes Works, General Graham-street, Sun-
derland.
Weymouth.—Completion of naive and west
end of St. Paul's Church, Westham (2,770);
Messrs. T. Conway, Ltd., builders, Com-
mercial-road, Weymouth.
Wilmslow.—Club premises for the Secretary,
Conservative Club.
Worcester.—Proposed baths; Mr. A. G.
Parker, Architect, Town Hall, Worcester.
Yarmouth.—Extensions to police and fire
stations (4,656); Mr. J. E. Pestell, builder,
Lanoeater-road, Yarmouth. A plan has been
passed for additions to premises, Riverside,
Gorleston, for the Royal National Mission to
Deep Sea Fishermen.

THE LONDON COUNTY COUNCIL.

THE first weekly meeting of the London County Council after the summer recess was held on Tuesday in the County Hall, Spring-gardens, S.W., Lord Chylesmore, Chairman, presiding.

New County Hall.—In reply to a question, the Chairman of the Establishment Committee stated that satisfactory progress was being made in the erection of the County Hall, and 186 men were now at work on the site.

Loans.—The Finance Committee recommended and it was agreed to make loans to various bodies as follows:—Hackney Borough Council, 1,385*l.* for underground convenience and 2,065*l.* for paving works; Hampstead B.C., 2,831*l.* for sewer works; Lambeth B.C., 10,000*l.* towards cost of Catford Bridge improvement; Poplar and Stepney Sick Asylum Managers, 2,160*l.* for Poor Law purposes; and Wandsworth Union, 2,600*l.* for Poor Law purposes.

The London Traffic Board.—The Chairman of the General Purposes Committee moved the resolution expressing regret that the Government did not just now propose to introduce legislation for giving effect to the recommendations of the Royal Commission on London Traffic with regard to the establishment of a Traffic Board, and also expressing the hope that such legislation would not long be delayed.

An amendment was moved by Sir John Benn to the effect that the establishment of a Traffic Board would be in violation of the principles laid down in the Local Government Act, 1888, and proposing that the machinery of joint committees provided by the Act for administering the concerns of adjoining localities should be put into force in connexion with the tramway service and of the construction of inter-county roads. He also proposed that the General Purposes Committee be instructed to take steps with a view to the Council obtaining from Parliament the transfer to them of the duties of traffic regulation now performed by other authorities.

In opposing this amendment, Mr. Cyril Jackson said that the Municipal Reform Party did not desire that the motor-buses should have any unfair advantages, but contended that, so far as they were useful for London traffic they should not be interfered with. If the police had not sufficient power to control them, the Home Office should obtain such powers.

Sir John Benn's amendment was lost, and the Committee's recommendation agreed to.

Cinematograph Halls.—Drawings have been submitted for the following:—By Mr. C. G. Dunand, for a cinematograph hall proposed to be erected in Albion-street and Lower-road, Rotherhithe; by Mr. T. H. Buen, for the adaptation of premises at the rear of the Castle Hotel, Eltham, for use as a cinematograph hall; and by Mr. P. H. Adams, for a cinematograph hall proposed to be erected in Osborne-place, Stepney.

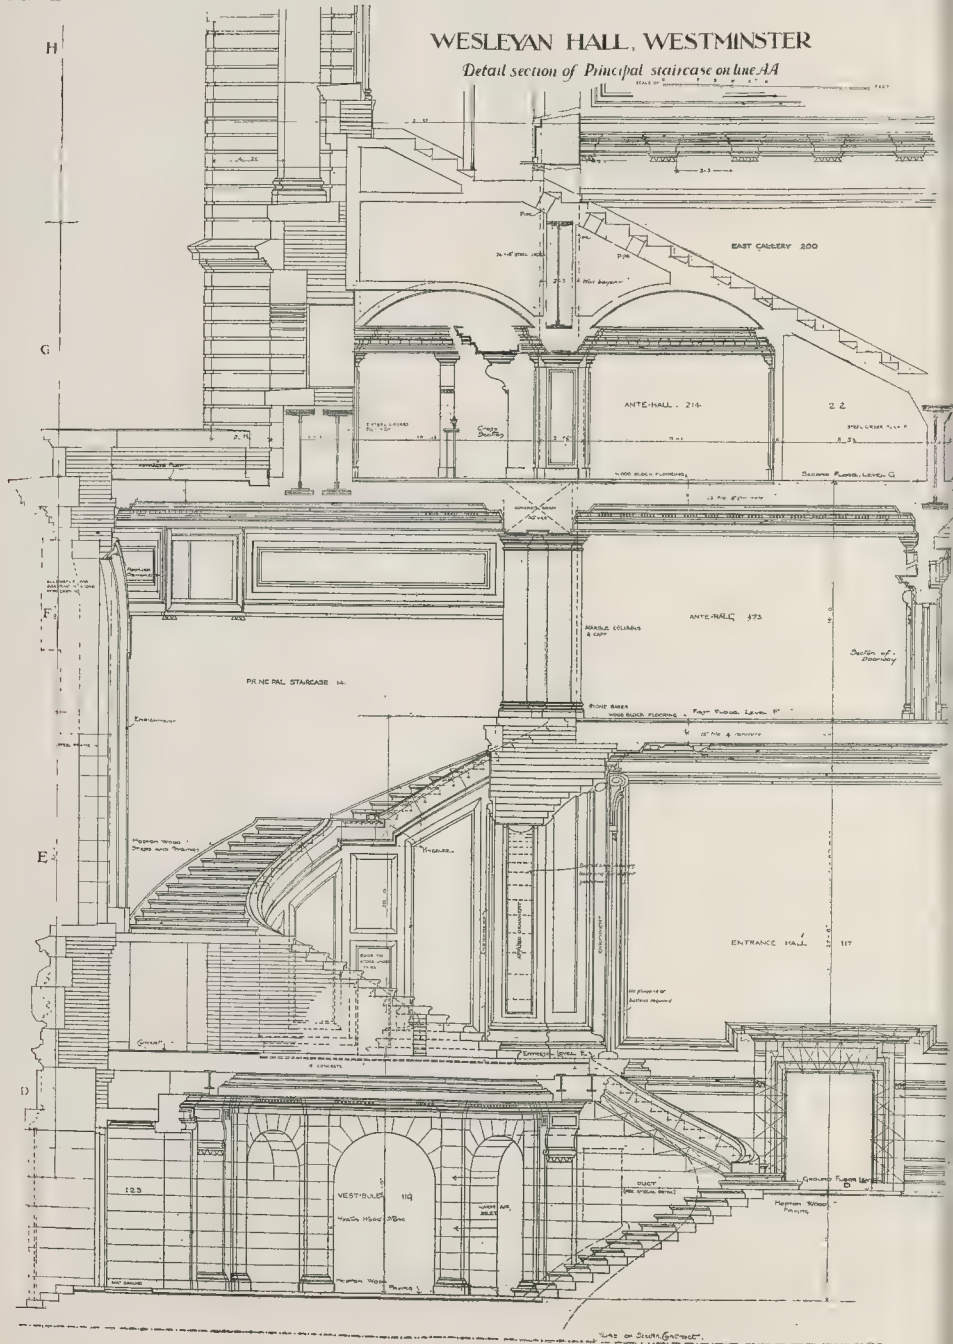

THE WESLEYAN HALL, WESTMINSTER.

The illustrations herewith are reproductions from the architects' drawings, showing interesting features in this building. The one on this page is a section taken through the eastern portion, and a good idea can be formed of the treatment of the entrance vestibule, which is carried out in Roman marble. A view of the staircase is also

obtained with the continuous flowing strings, which are a feature of the design. The ground floor entrance hall and the ante-hall to the first floor are depicted, and the monoliths, which are executed in "Agni Fantastique," will be seen immediately above the section of the large brick arch which is situated between the ground and first floors. The ante-hall, shown at the higher level, is that to the gallery entrance, this being treated in a simple yet effective manner,

while a portion of the eastern gallery given, together with the steel girders, which act as fulcrum and tailing down members respectively.

The drawing on p. 453 gives another view of the staircase, this being a section taken at the east end of the building looking towards the large hall. The large arch constructed of brickwork with recessed face and is extremely bold in detail. The entrance doorways to the large hall, which occur

on Line D-D

The New Wesleyan Hall, Westminster.
Messrs. Lanchester & Richards, F.F.I.E.A., Architects.

the upper part of the drawing, are executed with Roman marble architraves, cornice, and frieze, while the high marble dado is also shown. The general treatment of this portion of the building can be well realised from these two drawings, although the value of the colour effects is, of course, entirely lost, and the ornamental metalwork is not seen; thus a great deal of the character is absent, and allowance must be made for this.

A large quantity of the Portland stone used in the Wesleyan Hall, of which we gave a description last week, came from the Combefield quarries of the Bath and Portland Stone Firms, Ltd., Portland.

We may add that Messrs. J. W. Singer & Sons, Ltd., Frome, Somerset, carried out some wrought-iron and bronze work in the building.

THE CITY GUILDHALL EXTENSION.

A SPECIAL meeting of the Corporation of the City of London was held on October 10 for the purpose of considering the Report of the City Lands Committee recommending the adoption of the scheme of Mr. Sydney Perks, the City Surveyor, for the general improvement and extension of the Guildhall. The whole scheme will involve an expenditure of 130,000*l.*, but it was recommended that one section, relating to the rebuilding of the entire block of buildings on the east side of the Guildhall-yard—i.e., the Art Gallery and the Law Courts—should be at once proceeded with.

Mr. C. F. J. Jennings moved the adoption of the Report, subject to its being referred to the Finance Committee with regard to financial details. He said it had taken the Committee nearly five years to arrive at the Report, which was satisfactory in the main. It could hardly be disputed that the South Court, North Court, and Police-court were not a credit to the City. It had been suggested that competitive designs should have been obtained, and if they had been building on an open site there would have been scope for a competition between the best-known architects, and in all probability the Committee would have favoured a competition, notwithstanding the expense. At the same time, competition did not always result in success, as was shown in the cases of the Law Courts in the Strand and in the first competition for Holborn-viaduct. As it was, the scope for design in this case was very limited. Firstly, no one could know better the accommodation which was desired than the Corporation's own officers, and, secondly, the design for the elevation was handicapped by the surroundings. The closing in of the court either wholly or partially was carefully considered and rejected, as was also the suggestion for building across the front of the courtyard. From the Surveyor's drawings it was shown that a closed quadrangle on the site would have meant little more than a well. In determining the style of the elevation they had to take into consideration the Guildhall itself and Wren's church of St. Lawrence, Jewry, which many archaeologists and architects considered of equal interest to the Guildhall. With regard to the front of the Guildhall, the Corporation decided to perpetuate George Dance's work when it arranged for rebuilding on the west of the porch, and the general public fully approved of the decision. They would all be sorry if in each new period the old had been swept away, and they were glad to have samples of the work of the leading architects of each period in their cathedrals and public buildings. The present front of the Guildhall was extremely interesting to architectural students, even although it was a mixture of styles—part Gothic, part classic, and part Moorish. While, however, they wanted to preserve Dance's front, it did not follow that they should copy it for fresh buildings. On the other hand, a Gothic design would be incongruous in conjunction with St. Lawrence's Church, and would be also unsuitable for the purpose of the buildings. On these grounds the Committee felt they had done right in calling in their own officer, Mr. Perks, who was not only an efficient surveyor, but a Fellow of the Royal Institute of British Architects.

Mr. F. Brinsley Harper moved as an

amendment:—"That the proposed scheme for the improvement of the Guildhall and adjoining buildings be referred to three architects (to be nominated by the President of the Royal Institute of British Architects and approved by the Corporation) for consideration and report." Having referred to the importance to London of the matter, he said the question they had to ask themselves was whether they had the best design. He made no complaint whatever about the internal arrangements, but they had to bear in mind that Mr. Perks was a surveyor, and in the terms of his appointment it was expressly laid down that his duties did not refer to the design or execution of any works of an architectural character. They were told that the designs had been submitted to Sir Henry Tanner and approved by him, but he did not suppose that, so far as the principle was concerned, Sir Henry had brought his mind to bear on it. They were building for posterity, and must be careful not to make mistakes. If they submitted the design to three architects nominated as he suggested, then, whatever happened, they could say they had done their duty. Mr. Harper proceeded to criticise the design, which he said would give a quadrangle 50 ft. longer on one side than the other, and said that if larger space was wanted for the Art Gallery they could find it over the City of London Court. He objected to the Guildhall being made a picture gallery at all, and considered that the Gallery should be a separate building. He thought it was a mistake to have this mongrel architecture.

Mr. C. A. Morton, in seconding the amendment, said it appeared to him that the laying down of the frontage of the new buildings was altogether a mistake. Whether it was good or bad Gothic, the fact remained that the Guildhall was a Gothic building, and now to the right and left they were going to adopt a sort of classic architecture. They might call it English Renaissance, but later on it would be called classic. In mixing up styles they might easily make themselves the laughing-stock of the world.

Mr. Ellis warmly supported the Committee's Report, and asked where the criticism of Mr. Perks's design came from. He had looked at the professional papers, and found none, and the *Builder*, which was the recognised medium of the architectural profession, had illustrated the design. If architects had thought this was such a bad design they would have rushed on the scene at once. It was, in his opinion, a scheme which commended itself to every business man.

Mr. Matthews Wallis deplored the bringing in of Sir H. Tanner to approve the plans. They were doing something which would be historical, and he refused to take the responsibility of saying that the design before them was right.

Sir George Woodman considered that it was too late to call in other architects now. He asked the Court to abandon all side issues and to support the Committee.

Mr. Miller Wilkinson, whilst not pretending to be an expert in architecture, claimed that he had an artistic eye, and he considered Mr. Perks's work most excellent, and that it would carry kudos not only on the architect, but on the Corporation.

Mr. Walker thought the author of the scheme ought not to shrink from the ordeal of submitting it to three of the best architects who could be selected by an independent authority.

Mr. Matthews opposed the idea of submitting the matter to three architects.

Mr. Davies believed Mr. Perks had solved the matter very well, and it had been approved by the highest authorities. Mr. Perks had won his spurs, and they had confidence in him.

Sir William Dunn said they had in Mr. Perks an eminent architect, and, with regard to the Royal Institute of British Architects, he asked if they were enamoured of any building put up in the City during the last thirty years. He thought the design of Mr. Perks compared favourably with any other work done in the City.

Mr. Kimber thought Mr. Perks would be the last person to take offence if they carried the amendment.

Mr. Banister F. Fletcher supported the amendment, and said he had listened with

amusement to some of the architectural criticisms. A member told him the previous day that architecture in this country in the reign of Henry VIII. If he were Perks, knowing the amount of feeling regard to the treatment of this building, he would like to be supported by three eminent architects in the way proposed. This was the most important piece of architectural work the Corporation had undertaken for many years. He had looked the plans, and agreed that Mr. Perks shown considerable ingenuity and skill in the way he had arranged the different departments, but when he came to proposed treatment of the Art Gallery entirely disagreed. They could not of a gallery 500 ft. long without interfering with the symmetry of the yard, and objected to the prolongation of the north wing. He agreed with Renaissance architects of the court, but they must be careful that the central outstanding feature—the XVth-century entrance gateway—should be preserved, and the wings on either should be made subservient. It would be an architectural mistake to spoil the symmetry of the yard by making the eastern wing longer than the rest, and it would mean neglecting the principal entrance to a block of offices and a public-house. This should be avoided and their efforts concentrated on disconnecting the Guildhall from any surrounding buildings, and especially which had no connexion with them. It was necessary to have an additional picture gallery, it might be done by carrying a bridge across the street at the second-floor level giving access to the upper part of the of London Court, which could be converted into a gallery.

The amendment was defeated by a majority.

Mr. H. Percy Monckton briefly moved "That it be an instruction to the Committee to obtain designs for the elevation from architects to be selected by the Committee such designs to be submitted to the Court for the approval of one thereof."

This was defeated, and the following amendments which stood on the paper thereupon withdrawn:—

By Mr. J. Guntton: "To refer back to the City Lands Committee to entirely renege the scheme to allow the Court on either side of the Guildhall-yard to be properly planned, and ventilated, the whole plan shown being dominated by the Art Gallery also to revise the design generally with a view to keeping the height of the new buildings of the east and west sides of Guildhall-yard below the height of the existing elevation."

By Mr. Banister F. Fletcher: "That while agreeing generally with the proposed Guildhall improvement scheme, it be referred back to the Committee—(a) to produce additional drawings, so that the lighting of all the new portions can be clearly ascertained; and (b) to produce a revised architectural treatment of the facades to the Guildhall-yard, and one which shall involve any lengthening of the existing eastern wing thereof."

The Report was then adopted.

THE SOCIETY OF ARCHITECTS REPORT OF THE COUNCIL.

WE take the following from the twenty-eighth annual Report of the Council for the year 1911-12:—

"Registration.—Early in the session the Council of the Royal Institute of British Architects, after further consultation with the representatives of your Council, drew up a new supplemental Charter and by-laws to enable the arrangements previously provisionally agreed upon to be carried into effect. In January last a special general meeting of the Royal Institute was held to consider the question of applying for a new supplemental Charter and by-laws to authorise the Council of the Royal Institute to enter into an additional agreement with the Council of the Society of Architects.

A copy of these documents and the explanatory statement of policy drawn up by

l Institute and submitted to their members was at the same time sent to the members of the Society for their information. This meeting the whole matter was referred back to the Council of the Royal Institute, who thereupon appointed a Committee to consider and report upon the subject. It is understood that this Committee has held a number of meetings, and from time to time it has been reconvened or strengthened, but up to the present the result of its deliberations have not been made known to your Council.

Council had, as stated in their last report, already decided that the routine of the Society should continue without interference to the negotiations proceeding between the two Councils, and they have decided to also take up the Registration Bill and to resume activities at the time at which they were temporarily suspended two years ago pending the negotiations referred to. Steps are therefore being taken to reintroduce the Society's Registration Bill during the next session of Parliament.

South African Branch.—The fifth annual report and statement of accounts were presented last November and published in the *Builder*. Your Council have placed on record their appreciation of the services of E. H. Waugh, on the termination of his term of office as Secretary of the branch, consequent on his election as President. The membership of the branch now stands at 101, and there is every indication of further extension in this direction in the near future.

The following were elected on the Executive Committee:—President, E. H. Waugh; Secretary, D. Ivor Lewis; Treasurer, J. Harris; Committee, G. S. Burt, G. W. Nicolay, J. F. Beardwood, C. H. Stott, the local Hon. Secretary, Johannesburg.

With regard to the progress of Registration in South Africa, it is understood that the proposed new Union Bill will be presented to Parliament next session, or as soon as members of the various architectural societies interested have agreed on the clauses of the Bill. The Society's branch are taking part, a very active and prominent part in promoting of the Bill, and in this they being heartily supported by your Council. The nominations of the following members to the South African branch as Honorary Officers for South Africa have been confirmed by your Council:—

Section I.—Architecture: (a) Planning and Design, Mr. E. J. Wellman; (b) Architectural History, Mr. D. Ivor Lewis. **Section II.—Building:** (a) Construction, Mr. Beardwood; (b) Materials, Mr. G. W. Nicolay. **Section III.—Practice:** (a) Contracts and Specifications, Mr. S. C. Dowsett; (b) Practice and Prices, Mr. M. J. Harris. **Section IV.—Education.** Mr. E. H. Waugh. The activity of the members of the branch has been keen interest they take in practical questions may be judged from the statement showing the distribution of proportion of members of the Society on the Council of the various South African branches of architects:—

Association of Transvaal Architects.—Total of nine, of whom seven are members of the Society, viz., Messrs. R. Howden, D. Lewis, M. J. Harris, D. M. Sinclair, G. Nicolay, and E. H. Waugh. **Transvaal Institute of Architects.**—Consists of, of whom two are members of the Society, viz., Messrs. J. F. Beardwood and Wellman; and five honorary officers, of whom three are members of the Society, Messrs. R. Howden (Vice-President), D. M. Harris (Hon. Secretary), and D. M. Harris (Hon. Treasurer), while others are honorary members.

South African Institute of Architects.—Council of whom one Mr. F. J. Ing, is a member of the Society and another is a candidate for membership.

Education Committee.—This Committee has met six times, and have made all the arrangements for the reading of papers, the use of new books and pictures, etc., they are dealing with the issue of a new yearbook, the provision of an electric lantern, and other accessories for the lecture-room, the development of the library, besides other matters of routine. The loan library

has been rearranged and the card index catalogue completed, and the department generally systematised.

General Purposes Committee.—This Committee have met five times, and has been principally engaged in carrying out an instruction from the Council to embody in the Articles of Association the scheme adopted by the Council for reorganising the Students' Section and examinations, etc., and in considering and reporting upon the desirability or otherwise of amplifying or revising the Articles in other directions in order to better meet the present requirements of the Society and to provide for future developments. The following are the chief revisions proposed:—

The new articles will (*inter alia*) define more fully the qualifications and privileges of honorary and retired members, members, graduates, and students. Graduates will be a new class, examined only in design and general culture, the object being to eliminate students who show no real aptitude for the profession.

The age limit for direct membership is to be raised from twenty-eight to thirty years, and the method of election of members, etc., is to be by show of hands unless a ballot is demanded. Honorary members, graduates, and students are to be elected by the Council.

It is proposed to make the certificate of membership renewable from year to year and to suspend from privileges a member who has not renewed his certificate by March 31, or if not renewed by June 30 to exclude him, subject to his having power to apply for reinstatement if the renewal is made before September 1.

There is to be a special general meeting in October for the election of officers, etc., it being proposed that the annual general meeting for consideration of the Report and balance-sheet shall be held at a later date, so that both may be presented together.

Provision is made for the resignation or cessation of office of a member of the Council under certain circumstances, and it is proposed that the house list shall contain at least two names more than the number of seats on the Council in order to ensure a contested election.

The machinery for the Council elections and the duties of the scrutineers are provided for and prescribed, and the position and duties of the permanent officers are more clearly defined.

The powers of the Council are to be widened in regard to dealing with any alleged breach of professional etiquette, it called upon to do so.

Professional Defence.—The question of forming a Board of Professional Defence for the purpose of advising and, if necessary, assisting members in cases involving matters of general professional interest to the profession or of public practice has been carefully considered with the result that an Advisory Committee has been formed consisting of the President, the Vice-Presidents, the Hon. Secretary, and Secretary of the Society, together with Sir George Riddell and Mr. E. J. Naldrett, barrister-at-law (hon. members), and Mr. A. Montefiore Brice, barrister-at-law, and the Hon. Solicitor, Mr. T. Baines.

An adequate sum has been earmarked to form the nucleus of a defence fund for use when necessary in forwarding the objects of professional defence.

This is a very important extension of the work of the Society, and one which it is anticipated will be of great practical value to the members. It is a privilege in which any member, irrespective of distance, can participate.

Cases submitted to the Secretary will be brought before the Board, who will advise the Council on the merits, and if the interests involved are of such importance to the profession generally as to warrant any action being taken by the Society as a corporate body the Board will further advise the Council as to what course the Society should follow.

It must be clearly understood that the scope of the Board will be confined to dealing with matters involving questions of principle affecting the general body of members, and therefore of the profession as a whole.

The Council think it well to draw the

attention of members to the decision of Mr. Justice Channell in *Crittall Manufacturing Company v. London County Council*, which was an action by a sub-contractor to recover against his clients failing payment by the builder. It would seem desirable that in future architects should obtain a written undertaking from the sub-contractor that he will not look to the client or the architect for payment.

Membership.—A proposal for the development of the membership referred to in your Council's last Report has now materialised by the adoption by your Council of a scheme for grading the membership on the following lines, having in view the time when examination will be the only test of qualification for admittance to the Society.

Students.—Students are to be persons above sixteen years of age who are following or preparing to follow the profession of an architect. They are to be elected by the Council and are to be subject to certain prescribed regulations, one of which is that they must compulsorily retire from the Society on attaining the age of twenty-five, if they have not previously presented themselves for examination, unless the Council extend the time. Whatever competitions or other awards for this class are instituted by the Council will be limited to students under twenty-two years of age. There will thus be every inducement for students to qualify for one of the higher grades as early as possible. The annual subscription will remain at half a guinea, and there will be in addition an entrance fee of the same amount.

Graduates.—Graduates are to be architects' pupils or assistants, or persons undergoing some other course of architectural training approved by the Council, who are above nineteen years of age and have satisfied the examiners that they are students who have an aptitude for the profession and the necessary artistic ability. The examination for this class is intended to eliminate those who it is felt would be misdirecting their energies by devoting any further time to entering the profession. The remarks as to election and compulsory retirement apply also to this class, except that the maximum age limit is thirty-one.

There is to be an entrance fee of half a guinea to those qualifying from the students' class, and one guinea in other cases, and in either case an annual registration fee of one guinea.

The Travelling Studentship and Scholarship or other competitions limited to graduates are to be restricted to those under twenty-eight years of age, and it will be to the advantage of graduates to sit for the qualifying examination for membership as soon as possible. Graduates will have no vote.

Members.—The only alteration in this class is the raising of the age limit for direct membership from twenty-eight to thirty years of age.

The proposal is in principle a graded scheme of affiliation leading up to corporate membership, with proportionate fees for the examinations and for the annual registration fees or subscriptions.

The scheme if adopted involves alterations to the Articles of Association, relating to entry forms and other documents relating to procedure, the appointment of examiners, and many other matters which will automatically arise. The scheme cannot therefore come into operation at once even after the necessary revisions have been made to the Articles of Association.

Proper time must be given for working out the details of organisation and for giving notice, particularly in the case of those who have some vested interests in the matter—that is to say, students who are holders of sectional certificates and any relegated candidates.

Professional Ethics.—Members are already familiar with the details of the proposals for a code of professional ethics as set out in the Report published in the *May Journal* of the discussion on the above subject held by the Society in April last. The matter has since been again before your Council, and suggestions for a set of regulations have been drawn up by them and distributed to the members for their consideration.

There appears to be considerable difference of opinion on the matter both as to the

necessity or desirability in principle of endeavouring to codify regulations of this kind, and as to what form a code if drafted should take. Your Council, after prolonged consideration, have decided to embody and publish in due course the results of the many valuable expressions of opinion and suggestions made by members in the form of a schedule of guidance on the main points governing professional etiquette in the practice of architecture, and in the meantime to take powers under the Articles of Association to deal with any alleged breach of professional etiquette affecting members which may be brought to their notice.

By so doing the Council will be free to adjudicate upon any case on its merits and able to administer whatever penalty (if any) the offence may in their opinion call for, without being subject to the limitations which a written code might be held to exercise upon them when acting in a judicial capacity.

Examination Scheme.—The whole of the Society's examination scheme is under revision, and in due course there will be two examinations, one for admission as graduates and the other for admission as members. The details of the scheme are in the hands of the Committee, and will be published in due course.

For the future assessors are to be appointed by the Council in each competition to draw up the conditions and adjudicate on the work submitted.

Although only one entry was received for the student essay competition for the quarter ending June 25, the work submitted by Mr. Rayson was considered of sufficient merit to justify the Council in awarding him the prize.

It is intended in due course to restrict the Travelling Studentship to graduates and the Scholarship and quarterly competitions to students, and the scheme of competitions will probably be extended and amplified to meet the needs of both classes.

Copyright in Architecture.—Since the last annual meeting the Copyright Act has become law, and so far as your Council are able to judge, it would appear that the general effect of the Act is to entitle architecture to the same recognition and protection as painting and sculpture, as artistic work. The advantages of the Act to the architect are (*inter alia*) that to some extent it settles the question of the ownership of his own drawings, which are also protected from unlicensed copying, and cannot be used over again for another building.

The copyright is, however, vested in the building owner, and passes to the client unless granted to the architect by agreement between the parties, and it would seem that unless this is done or the building can be shown to be a work of art there is no protection against its being reproduced. Also, while damages can be claimed for infringement of copyright, an injunction to restrain the erection of a building or an order for its demolition cannot be obtained once the building has been commenced.

National Insurance Act, 1911.—The Architectural Association, in conjunction with the Royal Institute of British Architects, the Surveyors' Institution, and your Society, have had under consideration how best the interests of their members and those in their employ who come within the category of insured persons under the National Insurance Act may be promoted, and have come to the conclusion that the formation of a special "Approved Society" for architects' and surveyors' assistants and clerks would prove advantageous to those concerned. Your Council, on being approached on the matter, have willingly co-operated, and, subject to sufficient numbers being obtained, it was decided to found such an approved society, and, as a membership of at least 5,000 is necessary in order to form a separate entity for insurance purposes, it is hoped that the support of the profession may be relied upon in furthering an effort which should prove of benefit to those in the professions who come within the provisions of the Act. The Society has since been approved by the Commissioners.

Architectural Education.—Your Council have had under consideration a proposal for introducing into England a system of education on similar lines to the *ateliers* of the

Ecole des Beaux-Arts in Paris. Your Council, being of opinion that it is desirable to extend this system in England, have appointed a Committee to confer with educationalists on the subject and report in due course.

Generally.—It will be seen from the foregoing that all the threads temporarily dropped during the Society's negotiations with the R.I.B.A. have been picked up and the various matters in abeyance have been carried through and placed upon a working basis. New ideas have also been evolved or adapted to meet the present and future requirements of the Society and widen its scope and influence. In the opinion of your Council there is every prospect in the near future of the scope and utility of the Society being very widely extended, and there is little doubt that a continuance of a consistent attitude in regard to Registration will still further tend to enlist the sympathy and support of those members of the profession who favour unity, and thus materially hasten the attainment of one of the Society's chief objects.

ENGINEERING AND MACHINERY EXHIBITION.

The International Engineering and Machinery Exhibition which is being held at Olympia, London, W., from the 4th to the 26th of this month is well worth a visit. It embraces a wide range of exhibits, but the most prominent part of it is the impressive display of machine tools. To those who remember the comparatively rough-and-tumble methods of many English machine shops twenty-five years ago this Exhibition demonstrates a great change. The vital importance of accuracy in securing a maximum output, and the conviction that the best plant is the cheapest, have at last been brought home to everyone, and the machines now exhibited are the outcome of the demand for a maximum of efficiency in not only machines for special purposes, but also in all the ordinary plant of those carefully and elaborately equipped factories which to-day represent the old "millwright's" shop.

Among the machine tools we noticed the lathes of James R. Kelly & Co., Ltd., Leeds; of George Swift & Sons, Halifax; of H. Milnes, Bradford; of Holbrook & Sons, Stratford, London; of Charles Taylor (Birmingham), Ltd.; of Drummond Brothers, Ltd., Guildford; of the Colchester Lathe Company; of Greenwood & Batley, Leeds; of the Timbrell & Wright Machine Tool Company, of Birmingham, and many others. There are also boring mills by Webster & Bennett, Coventry; by the Dickenson Machine Tool Company, Ltd., Keighley; drilling machines by most of the above-mentioned makers, and by others so numerous that we cannot find space for even a list of their names, and a multitude of other tools, nearly all excellent of their kind. There is a good display of milling machines and tools embodying the principle of using many cutting edges in rapid succession, each of which takes a "fine cut," the rapidity with which the work is done being due to the large number of edges at work. It is perhaps in these tools that the need for great accuracy is most felt, as the slightest departure from true running makes the cutter quite useless. John Holroyd & Co., Milnrow; The Selson Engineering Company, Ltd., London; and Darling & Sellers, Keighley, are among the exhibitors of milling machinery. Akin to this class is the ingenious adjustable reamer shown in action by Vickers, Ltd., Westminster. Essential adjuncts of milling tools, circular saws, and, in fact, of all accurate-cutting tools, are grinding and sharpening machines, and of these we may note Hill's (Derby) patent saw-sharpening machine, and grinders by Alfred Herbert, Ltd., Coventry; by James J. Guest & Co., Ltd., of the same town, and by Richard Lloyd & Co., of Birmingham. The Birmingham Small Arms Company, well-known for all such small work as is now generally made interchangeable—bicycles, motors, engineer's small tools, etc.—have an interesting show of their specialities in tools. Admirable die-finished castings are shown by the Patent Castings Syndicate, Ltd., Finsbury, and by Acrotors, Ltd., Upper Edmonton.

Some exhibits of especial interest to readers will be those of such firms as James Keith & Blackman Company, Ltd., the well-known makers of fans and air-pellers; the Sturtevant Engineering Company, Ltd., whose fans and exhausting plant accompanied in the Exhibition by examples of their rolls and crushers.

The Metallurgic Syndicate (Wakelin Dent), London, show their specialities in Adamantium Bronze for bearings, brass, etc., and Ormolum, a rich golden-colour alloy for architectural purposes. Pines Johnson & Co., Ltd., show a good assortment of their special paints for machine structural ironwork, and other uses.

The Korford Company, Westminster, exhibit their system of insulating machine foundations to prevent the transmission of vibration. This is an invention that should be considered by architects when arranging for lifts, motors, or other moving plant in buildings. A modification of it is useful for a sound-check in floor metal we turn to models exhibited by Bassett-Lowke, Ltd., London, whose productions range from most elaborate works here shown down to working models such as are the delight of mechanically-minded schoolboys.

The British Vacuum Cleaner Company, Ltd., has become "a household word," and the company now produces an important addition to the economy of factories in the shape of an excellent boiler-flue cleaning plant.

Before leaving the subject we may attract attention to the machines shown by "Addressograph (1910), Ltd." They are indispensable in offices where large numbers of names and addresses have to be put into wrappers, labels, envelopes, etc., or turned into such forms as dividend warrants, register sheets, etc.

An exhibition to which more than a few important firms have contributed cannot adequately noticed in the brief space we are able to devote to it. We have mentioned a few exhibits; there are dozens more equally good, and we recommend our readers to see for themselves.

FOREIGN AND COLONIAL

Labour in the Colonies.

The October circulars of the Emigrant Information Office and the annual edition of the penny and other handbooks issued by the Emigrants' Information Office, 34, Broadway, Westminster, S.W., show the prospects of emigration. In Canada there is no demand for more male labour during winter. In New South Wales, in Sydney, the building, furniture, and trades have been fairly well employed, competent men in these trades, and bodied labourers are in demand. In the employment continues to be good, and as nominated passages are granted to classes. There is a considerable demand for useful men; and there has been plenty of work for mechanics in the building and trades. South Australia grants cheap passage to rural workers and their families, and approved emigrants. The building, engineering, and other trades continue busy; a large amount of money is being spent on ways and other public works. There is a good demand for masons, plasterers, joiners, cabinet-makers, brick-makers, tinmiths, makers, galvanised ironworkers, brass fitters, and cooper smiths. There is a good demand in Queensland for labourers on railway construction, and in some places for mechanics if they are not too specialised. In Western Australia competent mechanics in the building trades have usually little difficulty in obtaining employment. In New Zealand work in the trades is fair, but there is no special demand for more mechanics. In the Union of South Africa employment in the building trades in Johannesburg continues active; but the number of men is quite sufficient. At Durban there has been a demand for a few good plumbers and plumbers, otherwise there is little demand for more labour in any part of the Union.

Building Material and Stable Fittings.—The *Diario Oficial* of September 14 puts a decree (No. 9,690) earmarking in favour of the Ministry of Justice and Home Affairs an extraordinary credit of 500,000 Mesta (35,300*l.*) for the purpose of completing the erection of the cavalry barracks intended for the Police Brigade in Salvador de São-Rio de Janeiro.

WESTMINSTER CITY COUNCIL.

the fortnightly sitting of this Council October 10 the following amongst others were dealt with:—

Issues of Historic Interest.—In reply to a letter for information from the Clerk of London County Council it was recommended that he be informed that the Council not aware of any places of interest in City which are not adequately protected. **Readily.**—The Improvements Committee decided a number of letters arising in relation to their action in May last with a view of raising the level of Piccadilly between Saville Club and the Junior Athenaeum and getting rid of the existing dip. The owner of the Sutton Estate raised no objection, providing there would be no pre-emption to the rights of lessees fronting on Piccadilly, and the London County Council thought the scheme one they might support. The Secretaries of the Saville Club and Junior Constitutional Club took strong objection to the proposal, and the Office of the Clerk wrote declining to surrender any park for widening Piccadilly westward from the Hotel. In view of the opposition, the Committee considered it useless to take any further steps in the matter at the present time.

Trust Surveyors' Fees.—It was agreed to communicate with the London County Council, expressing regret at the decision they had reached, to propose legislation to secure compensation to the Trust Surveyors of the London County Council for the fees charged by District Surveyors.

LEGAL COLUMN.

Land Valuation: Settled Estates.

In the recent case, *Knollys' Trusts, Saunders v. Knollys* (Lancaster, 1912), the Court of Appeal was asked to consider the effect of the provisions of the Land Valuation Act, 1909, in relation to the valuation of certain settled estates, the exception of a small plot of land upon which houses had been built, let on leases. About 275 provisional valuations had been made for the purpose of determining the value of the property. The person entitled to the property in remainder called upon the trustees to have these provisional valuations confirmed by independent valuers at the time of the estate, on the ground that the valuations were too low and the property therefore, he claimed, was prejudiced. It was stated that the cost of such a valuation would be £80,000, and the tenant for life would be liable to this expenditure. By the Finance Act, 1909, section 27, subsections (1) and (2), it is provided that the tenant for life should be liable to take steps to question provisional valuation if he is dissatisfied; but that if the tenant for life would come to the Court of Appeal, affirming the valuation, he should be entitled to the rental of the land. The only evidence in support of the valuation was an affidavit by a surveyor, who stated that in his experience valuations under the Act were usually too low. The Court of Appeal, affirming the judgment of the Chancery Division, held that this was a case of discretion by the trustees, and the Court, in the circumstances of this case, should not interfere with the discretion of the trustees. The case was referred to one or two points for consideration under the Act. The person who, as a rule, is to be appointed by the trustees, is the person who, as long as an occasion arises for the valuation of the property, is to be appointed. The person who is to be appointed is the person who has no particular interest in the property. This is illustrated by the facts of this case. The piece of land upon which the houses had been built, and which was not well developed without an "occasion" arising, was the tenant for life's objection to the valuation of the plot at the expense of the trustees. The remainderman entitled in reversion is a direct interest in the provisional valuation, and he can, as "a person interested in the land" under section 27 (5), take steps to question the valuation as if he were the tenant for life. It appears he must do so at his own cost, as by section 39 it is only the tenant for life who is empowered to question the valuation. The trustees who are empowered to question the valuation, and the facts of the case, the Court held the trustees to be entitled to exercise their discretion, and the Court of Appeal pointed out that circumstances might arise in which it would be the duty of the trustees to apply to the Court quite differently from the present case. It must be special circumstances, Lord Farwell pointed out that to hold in

the absence of special circumstances that a duty was imposed upon trustees to check the official valuations would be tantamount to an assertion that the Government Surveyors were not trustworthy.

LONDON COUNCILS.

Acton.—At the last meeting of the Town Planning Committee of the Council it was decided to make application to the Local Government Board for authority to prepare a town-planning scheme under the Act. In connection with this matter the Committee reconsidered a letter from the London County Council, stating that in any town-planning scheme which the Acton Council proposes adopting, provision should be made for the continuation, westward of Old Oak Common-lane, of the new Western-avenue suggested by the London Traffic Branch of the Board of Trade, for the purpose of relieving the Oxford-road, and expressing the hope that, in connection with the scheme, provision will be made for the widening of Old Oak Common-lane to 60 ft., and for securing an outlet from the Council's housing estate through the land proposed to be included within the scheme, on the north-western side of the estate. After a good deal of discussion it was decided to inform the London County Council that the Council was not prepared to definitely pledge itself in connection with the proposed Western-avenue until the financial proposals connected with its construction are placed before them.

Barnet.—A plan has been passed for Mr. J. M. Kennard, architect, 15, Railway-approach, London Bridge, S.E., for a building adjoining No. 5, Braddon-street.

Deptford.—At the last meeting of the Borough Council the tender of Mr. H. L. Holloway, Deptford, was accepted for the erection of the Central Library. The firm's prices were:—10,482, if erected in Bath stone and deal joinery; 1,529, extra for Portland stone and hardwood joinery; and 468, for sundry items. It has not yet been decided whether to accept the first or second quotation.

East Ham.—The Borough Engineer has been directed to pave a portion of Bartle-avenue with tarred macadam. Plans and estimates have been approved for making-up a portion of Masterman-road at an estimated cost of 794. Plans have been passed for Messrs. Red-bond & Co. for eight houses, Chesley-gardens, and for Mr. P. Hamlett for twenty-four houses, Monpelier-gardens. A plan has been lodged by Mr. R. G. Hindle for a cinematograph theatre on site of Nos. 949 and 951, Romford-road.

Eltham.—At the last meeting of the Parish Council it was decided to ask the Barnet Rural District Council to put in force the Housing of the Working Classes Act in Boreham Wood.

Friern Barnet.—Sanction has been received from the Local Government Board to the borrowing of 1,169, and 215, for carrying out improvements in Friern Barnet-road and Friern-lane respectively.

Hackney.—A portion of the footpath of Upper Clapton-road is to be flagged. The existing York flagging on the footways in a portion of Chapman-road is to be taken up and, as far as suitable, refaced and relaid to the full width of the footways; the asphalt-paving in other portions is to be taken up and concrete laid *in situ* to a depth of 1½ in., or thereabout, is to be put down, and various other repair works are also to be carried out at a total estimated cost of 552. The carriage-way in a portion of Wick-road is to be paved with 3-in. by 7-in. Guernsey granite sets, laid upon a bed of Portland cement concrete, at an estimated cost of 4,805. The tender of the Strand Building Company, 200, Strand, W.C., has been accepted for constructing an underground convenience in Kingsland-road. The amount of the tender is 1,151. Electricity mains are to be extended at an estimated cost of 70. A Report has been prepared by the Borough Engineer (Mr. N. Scorgie) upon the condition of the roads of the Borough through motor-bus traffic. In this Report he says that roads which, until the advent of the motor-bus, were in good condition, are now having their surfaces destroyed and their foundations disintegrated, while others have had to be entirely remade with more lasting materials. Where this has not been necessary up to the present time it has been found that the useful life of the road has been considerably curtailed, even to the extent of 25 per cent. Foundations of Portland cement concrete, which were sufficient a few years ago, are now quite inadequate, and in all reveals where defects have been found, and in new work undertaken, the foundations are now increased in depth by 50 per cent. From 1906 to 1909 the cost of repairs to certain wood-paved roads averaged 86, per annum, as against the annual average of 1,047, from 1909-12, while between April 1

and August 31 of this year the cost already amounts to 813. In addition, roads which would have lasted years longer under ordinary traffic, have had, and will have, to be renewed. In Stamford-hill, Kingsland-road, and Victoria Park-road, out of an estimate of 7,350, 1,300, is for foundation renewal. Plans have been passed for Messrs. G. Wilson & Co. for workshop and offices, Hertford-road, and for Messrs. Stapleton & Sons for additions to premises rear of Nos. 238-240, High-street, Stoke Newington.

Hendon.—The Surveyor has been instructed to submit an estimate of the cost of laying wood-paving in portions of Golders Green-road; also an estimate for specially-dressed granite setts laid in bitumen in that portion of the route from the cross roads, Golders Green to Edgware-road, where wood-paving would be unsuitable. At the time it was estimated that the work would be between 36,000, and 40,000. Plans and estimates have been approved for making-up Golders Green-road at an estimated cost of 1,356. The tender of Messrs. Turpin Brothers, at 225, has been accepted for carrying out repairs to the Hyde Fire Station. The following plans have been passed:—Mr. John Robinson, ten houses, Seymour-road, The Hyde; Messrs. Moss & Sons, three houses, Hammer-lane, Mill Hill; Messrs. Welford & Co., dairy, corner of West Heath-avenue and Finchley-road; Mr. P. Boulting, cinema, Brent-street; Messrs. Everath & Edgcombe, additions to Colindale Works; Mr. B. Wright, nineteen houses, Sneath-avenue, Golders Green-road; Mr. E. Streather, eighteen houses, St. Andrew's-road.

Hford.—At the last meeting of the Urban District Council the General Purposes Committee reported having considered plans and estimates of two schemes in connection with the proposed extension of the Town Hall and public offices, one for a portion of the extension and the other for the completion of the Town Hall and public offices upon land already acquired at the rear of the Town Hall, and that they had decided to adopt the latter proposal for further consideration. Councillor Gunary, speaking upon the question, explained that the scheme was estimated to cost 18,000. A good deal of discussion then ensued upon the question, in which instances of the present inadequate accommodation of the present building were put forward, but in the end the matter was referred back to the Committee.

Stepney.—A communication is to be addressed to the London County Council requesting them to reconsider as a metropolitan improvement the proposal to widen Cable-street at its junction with Leaman-street. The existing sewer in a portion of Exmouth-street is to be substituted by one constructed of new glazed-ware piping, at an estimated cost of 150. Plans have been lodged with the London County Council by Mr. W. M. Knight for the erection of a building at Hough's Wharf, Narrow-street, also by Mr. F. E. Harris for a building at the rear of No. 381, Mile End-road.

Wandsworth.—Plans have been passed for Mr. T. G. Rogers for the erection of a motor garage, etc., in Prince's-road, Southfields; also for Messrs. Holloway Brothers (London), Ltd., for twelve houses in Loxley-road, Springfield.

Watford.—The Library electricity sub-station is to be extended. At a recent meeting of the Urban District Council Mr. Tripp asked if the Council could not do anything to preserve the amenities of the town by insisting on more variety in the buildings. They did not wish to see row after row of houses all of the same stamp. On being informed that the Council had no power in the matter a suggestion was made by Mr. Gorie that a joint Committee of Councillors, architects, and builders should be called. The tender of Mr. W. W. Bateman, Chesterfield, has been accepted at 4,776, for certain work in connection with the Balmoral-road sewerage scheme. The following plans have been passed:—Mr. P. H. Cartwright, four houses, Oxhey-avenue; Mr. E. Fuiks, four houses, Oxhey-avenue; Messrs. W. King & Sons, vicarage, St. Alban's-road. A plan has been lodged by Messrs. Barclay & Co., Ltd., for new banking premises in High-street and King-street.

West Ham.—Alterations are to be carried out at Plaistow Hospital at a cost of about 100. The following plans have been passed:—Mr. J. H. Gladwell, alterations and additions to Railway Tavern, Freeman's-road, Custom House; Sir J. H. Bethell, cinematograph theatre, 61, Broadway, Stratford; Mr. H. I. Cundy, cinematograph theatre, Richmond-street, Plaistow; Mr. W. Hancock, cinematograph theatre, 302, Romford-road, Forest Gate. Plans have been lodged by Messrs. F. Sherrin and H. Harrington for a sailors' home, etc., rear 61, Lambert-road, Custom House, and a shirt factory, Hollum-place, West Ham, respectively.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, —, Contracts, iv. vi. viii. x.; Public Appointment, xxi.; Auction Sales, xxvi. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

. It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

OBITUARY.

Mr. J. Parker.

the death, suddenly, in London, on October 5, of Mr. James Parker, of Turl, Oxford, in his eightieth year. Mr. er was the son of Mr. John Henry Parker, K. Keeper of the Ashmolean Museum, and or of the "Glossary of Architecture," of h the first edition appeared in 1855. Mr. r was educated at Winchester; honorary degree of M.A. was conferred him by Oxford University in 1877. He a leading member of the Oxford Archi-tectural and Historical Society, to whose scriptions he largely contributed, as well as e *Proceedings of the Geological Society*.

Mr. J. E. Hodgkin, F.S.A., F.R.Hist.S.

the death, on October 5, at the Wood-s, Putney, is announced of Mr. John E. Hodgkin, the art collector, aged 72 years. He published in three times his "Rariora," a catalogue of objects, s 20,000 in number, which he gathered ther, and twenty years ago brought out a work upon "Examples of Early English ury," in 1866 he published "Monograms,

Ancient and Modern." The Historical Manu-cripts Commission published J. C. Jeaffreson's digest of a volume of 400 pages relating to Mr. Hodgkin's English historical documents of the XVIth-XVIIIth centuries period.

Mr. V. Pendred, M.I.Mech.E., Soc. of Eng., etc.

Mr. Vaughan Pendred, who died at Streatham on October 12, aged seventy-six years, was appointed editor of the *Engineer* in 1865, and retired from the conduct of that journal seven years ago. His youth was spent on the family estate of Barraderry, Co. Wicklow, and he was educated at home. Though he had no special training as an engineer, he attracted the notice and help of Mr. Zerah Colburn, the then editor of the *Engineer*, who put some work in his way. His technical writings became known also to Mr. Passmore Edwards, who in or owner of the *Mechanic's Magazine*, who in or about 1863 appointed him as editor of his paper; he was then nominated to succeed Mr. Colburn on the *Engineer*. Mr. Pendred was a member of the Iron and Steel Institute, of the Society of Engineers, and (by invitation) of the Institution of Mechanical Engineers. One of his three sons succeeded him as editor of the *Engineer*.

TRADE CATALOGUES.

Messrs. Chance Brothers & Co., Ltd., Bir-mingham, send us a copy of their latest catalogue of Vitreous tiles and mosaic. The tiles, which are of solid glass throughout, and being non-absorbent, may be used on external walls, are made in two forms—with regular edges and with antique rough-cut edges. Moulded angles, cappings, and skirtings are supplied in great variety. Excellent illustrations are given of tiling schemes for entrance halls, staircases, bathroom walls, floors, fire-place surrounds, jambs, hearths, etc. The mosaic is manufactured in cubes as well as in irregular-shaped tesserae for random work. Where elaborate designs are adopted, Messrs. Chance will quote for material set up on paper ready for fixing, but simple schemes can be laid directly to the floor. Effective examples are illustrated of every sort of mosaic work. The firm, who also manufacture window glass of every description, ask us to state that a copy of their catalogue may be had by architects should they desire to have one.

We have received from the Carron Company their latest catalogue of rainwater, soil goods, and sanitary castings. Under the heading

are many designs for ornamental rainwater pipes, heads, bands, and gutters; the firm will submit designs for castings of any description on receipt of specification.

The Patent Rapid Scaffold Tie Company, Ltd., of 124, Victoria-street, London, S.W., send us a price list of their well-known Scaffold tie, containing photographs of a few of the many contracts where their Scaffold ties have been made use of. Among these we note the new Y.M.C.A. building in Tottenham Court-road; the new Money Order Office, Holloway; the reconstructed block of Oxford-circuit; and the Savoy Hotel extension. This last example is of especial interest from the fact that, owing to the limited time allowed for the contract, every platform was simultaneously worked from and heavily loaded with masonry. In this connexion it may be remarked that, whereas the computed safe load on ordinary scaffolds is 56 lb. per square foot, a scaffold constructed with Scaffold ties has been experimentally loaded to 350 lb. per square foot. Scaffold ties were used as cramps for the moulds to the reinforced columns at the Amalgamated Press building, Farringdon-street, E.C.

We have received from the British Ceresit Waterproofing Company, Ltd., of 63, Victoria-street, London, S.W., a booklet, entitled "Ceresit and its Uses in all Building Operations." As illustrating its employment in important contracts, we may select the new Liver Buildings, Liverpool; the Royal Society of Medicine, Henrietta-street, Cavendish-square, London, W.; and the new reinforced concrete swimming-bath at Chocade Hulme, near Manchester. Ceresit is now so widely known that we need do no more than remind our readers of its prowess in conquering the effects of damp as an exterior or interior walling, in damp-courses, cellars, roofs, floors, tanks, and a hundred other uses which will readily suggest themselves. Exhaustive tests have recently been carried out at the National Physical Laboratory, Teddington, on slabs of cement mortar treated with Ceresit, as compared with slabs without Ceresit. Each was subjected for a considerable period to the action of water at a pressure of 434 lb. to the square inch, with the result that no sign of dampness appeared on the under surface of the slabs treated with Ceresit, while the slabs made without Ceresit were found to be saturated with water, large drops being suspended from over the under surface.

Mr. Alexander G. Lee, of 14, John-street, Bedford-row, London, W.C., has just issued a new prospectus of the "All Time" sheet lead and asphalt damp-course, with a copy of which he has been good enough to favour us. The lasting qualities of lead, illustrated by the many inscriptions, coins, sheets, and pipes of lead which have come down to us from remote antiquity, suggested its use as a damp-resisting stratum eminently suitable for damp-courses. The "All Time" damp-course consists of a continuous layer of sheet lead, embedded between and closely compacted with two protective layers of specially-prepared fibrous asphalt sheeting. It is stocked in all wall-widths, in rolls from 33 ft. to 66 ft. long, without a joint. A six-fold watertight lap joint can be readily formed where required. It is supplied in four qualities, A, B, C, and D. Contracts have recently been executed for the War Office, the Admiralty, the Home Office, and many of the leading railway companies.

TO CORRESPONDENTS

We cannot undertake to return rejected communications, and the Editor cannot be responsible for loss of drawings, models, or for models or samples sent to or left at this office, unless he has specially asked for them.

Drawings, models, or samples sent in for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience will result if no attention is paid to this.

Any commission to contribute articles, or drawings, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, and the Editor reserves the right if it is unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be sent to the Editor, and the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than 6 p.m. on Wednesday*. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.* unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

ARCHITECTURAL REVIVALISM AND THE NEW DELHI.

THE oscillations of authority exhibited in British Government buildings during the past century are probably beyond compare. Munich has a reputation for pulsive artistic government, Vienna at least in two great directions during the long reign of its present Emperor sued opposite ideals, but London, without the impulse of Munich the compulsion of new Vienna, has deduced an architectural miscellany wonderful range and extraordinary density but of small resulting influence. Have as the result of a century of governmental development and building leaved no architectural school and re consecrated no other tradition n that of eclectic revivalism as a ional characteristic. The neo-Greek which one hundred rs ago succeeded to the current dition of Chambers and Nash has us, among others, such monuments the Bank of England, the late ented Post Office, the National lery, and the British Museum, each

having necessarily an underlying characteristic plan expressing a modern purpose, but clothed in as purely Grecian architecture as the architects could command. The Gothic revival which ensued, in the contrariety of revivalism, gave us the Houses of Parliament, certainly one of the most important buildings of the XIXth century in Europe, having its aftermath in the Royal Courts of Justice, effervescing with scholarly enthusiasm, but less characteristic either of our past or present than any other official building of similar scale. Between these Gothic landmarks lie such achievements as Holloway Prison and the Record Office, each purposeful and expressive, but nartistic because inflamed with false sentiment. Queen Anne then stepped into the breach in the actual break-up of traditional lines of artistic thought, claiming to be a *via media* in the battle of the styles, to which the New Scotland-yard remains, already in the distance, as another monument of individual power, without parentage or descendants, among

the miscellanies of official architecture. A manner of design which originated in purely domestic traditions was exaggerated into the scale of a great public office in this chief instance, and in a multitude of others applied to a wide group of large school buildings, imparting only quaintness where something more satisfying and educative would have been welcome. Meanwhile, outside the stream of enthusiasm, beyond the influence of the revivalists of the bygone, there existed a current type which the elect rudely classed as nartistic, employing the ordinary forms of cornices, arches, and imposts, and which for want of an historic label was properly named Victorian, a good name which has unfairly attained an almost contemptuous meaning. This style, for such it is, lacks that flavour of antiquity valued by the epicure in game, which is supposed to give value and justification to the later Georgian or the works of the Adam Brothers. It represents the practical residuum of modern architecture deprived of that artistic attention to refinement,

proportion, and decoration which was appropriated by architects devoted only to revivalism. Shorn of the ephemeral trappings of fashion and gyrating taste, this Victorian type of building remains our most generally representative architecture. Its defects are our fault, and its permanence and commercial usefulness a constant witness against our perverse tendency to gather only the fruits and flowers of past architectural growths instead of attending to the roots from which true development proceeds.

If we did not habitually look backwards for architectural guidance and inspiration the opportunity which the new Delhi affords for progress and development would offer no ground for discussion of the "style" or epoch proper for its buildings. For more than a century we have indulged ourselves in these antiquarian studies with only a pseudo-artistic intent. Nothing is of greater value to the architect of to-day than an intelligent knowledge and sympathetic appreciation of the building motives of the past, if the aim of his inquiry is directed to the mind which planned rather than to the accidents of its artistic expression. But the employment of the ancient styles, with superstitious reverence, as artistic fetishes, or as magic "open sesame" to beauty, is not really that intelligent archaeology which is desirable; instead of this it has led to mere revivalism without permanent benefit to the stream of our national architecture. It is therefore important that architects should recognise and break with the habit of weighing every modern opportunity for a great building as an occasion for the selection of another suitable artistic style from their gallery of antiquity.

The distinction between artistic revivalism and intelligent archaeological study must be preserved and insisted upon; the one is superficial and both facile and fascinating to a ready draughtsman, while the other is essential and difficult of elucidation, involving in its analysis of purpose (so to speak of the mentality of a building) research into economic motives and methods of construction of essential value in the promotion of our adaptative and progressive habit of architectural thought.

Review of the lessons of history in an attempt to appreciate the attitude of mind towards the architectural problems of a new capital city displayed by the great nations of antiquity will furnish the guidance and inspiration which this problem demands, but the discussion of style upon the basis of artistic sentiment will be fatal to any hope of laying architectural foundations which succeeding generations can be content to build upon. The modern English architect with this uniquely characteristic subject must undertake to think soberly, without the fictitious glamour of antiquity cast upon his imaginations, and endeavour, as he very well can, to be at once true to our own *Zeitgeist* and to his own genuinely artistic perception of refinement in building art. The material for architectural expression lies at hand in the universally accepted classic tradition, always progressive, and in the hands of continental architects manifestly

original and consistent. If enthusiasm is the note of the modern student there is as much stimulant in the study of the present as of the past.

Our building art is *de facto* as extensive as our Empire, for from the capitals of Canada in the North West to the new Federal capital of Australia in the South East, wider far than the ægis of ancient Rome, all are being built in modern practicable adaptations of classic architecture, and need only that artistic power to make them fine which we have hitherto spent in looking backward. The special influences of climate, material, and purpose will condition and express themselves in this classic style quite truly in Delhi, while conviction that the path is one of definite progress will give vitality to the school which must arise locally to carry out in many varied applications the official architecture of the new capital. Greater Britain cannot afford to put back the hands of the architectural clock-face which keeps time for ages.

THE UNITY OF ART.

AT the opening meeting of the new session of the Architectural Association Mr. Gerald C. Horsley, F.R.I.B.A., closed his Presidential Address, which he had devoted mainly to new developments in the School of Architecture, with the reminder that the underlying purpose of all educational effort and development is to help forward the course of our art, and that therefore it must be based upon the principle that art is unity. In this at least all thoughtful students, old and young, will agree. Yet none the less there is need that we should thus be reminded of it as a fundamental principle which, especially in the presence of the young student, it is scarcely possible to dwell upon with too great an insistence. The principle has many aspects, and we do not at present wish to touch upon that of the universality or continuity of true architecture or the unity of all the other arts under architecture, but only on that aspect which insists upon the axiom that all genuine architecture must first of all be a unity in itself. Tried by this standard, where does architecture stand to-day? In education—in textbook, classroom, and examination—those studies having for their object the making of buildings beautiful are still to a too large extent dealt with separately from those of their efficient arrangement and construction. The personnel of the profession—principals, assistants, pupils—tends to divide into two broad types, often with a quite healthy and good-humoured contempt of each other, the "artistic," with great and sometimes scholarly knowledge of styles, and ingenuity in aesthetically designing in them; and the "practical," with knowledge of construction and materials and ability to arrange and carry out buildings. And in actual practice, apart from the broad cleavage of building into engineering and architecture, there is in the latter a growing divorcement between architectural features and the real factors of construction. The true construction of

buildings tends to be lost in a conventional semblance of construction applied from without, often noble and beautiful enough—were it but true. The two purposes of art, use and beauty, dragged apart and the name of art reserved for the abstract adornment of what is conceived of as in itself ugly. Can it be denied that these things are so, and are becoming more tolerated? Truly we need to be reminded every day that art is unity, that the beginning of architectural beauty are to be sought in true and efficient arrangement of construction and the right and joyful use of materials; and that the intelligent study of the old styles is useful mainly to these ends. Aiming at this with the utmost of our striving we shall try to run our course and hand on the torch alight to those who take our place.

NOTES.

Wren—and a Statue.

ADVERTING to our lead article of the 18th inst. and our comment in the same issue upon the absence of a statue to Sir Christopher Wren in the metropolitan gallery, we may mention that M. Gustave Pessard, of Paris, has just issued a pamphlet in which he gives a classification of the statues erected in Paris by famous men, and shows there are fifty to poets, forty-seven to authors, thirty-nine to painters, twenty-three to architects, and twelve to sculptors. Pessard reckons that, besides the monuments in burial grounds, the number of men thus individually commemorated exceeds nine hundred, the poets being the most numerous. The figures of Wren, Pugin, Barry, C. P. Cockersell and other architects, sculptured in marble in relief around the podium of the Prince Albert Memorial, completed in 1871, are by J. Birnie Philip.

Buckingham Palace.

THROUGH the courtesy of the First Commissioner of Works and Sir Aston Webb, R.A., we have had an opportunity of seeing the approved design for the new front of Buckingham Palace, which we intend to illustrate in our next week's issue, together with an article on the architecture of the Palace. Considering the strict limitations under which Sir Aston Webb has been compelled to work, which have precluded him from altering the arrangement and spacing of doors and windows, we consider the design will meet with general approval. The new front is restrained, quiet, and dignified, and forms a fitting architectural background to the late Queen's Memorial.

"The City Beautiful."

AN American writer, in an article "On the Modern Towns in America," which appeared in a recent number of *Scribner's Magazine*, protests against the use of the phrase "the city beautiful," although he contributes many useful ideas towards the practical realisation of a beautiful city. We do not feel inclined to resent his protest. The phrase has become hackneyed, and as soon as a phrase which may be pleasant enough in itself is adopted without discrimination it no longer becomes misapplied, but loses its

inal significance. In any case, the peculiar epithet in question can only properly used in giving expression some ideal conception, because the grammatical inversion could not very be applied to an existing state of gs. There are many beautiful cities, there is no existing city beautiful. Two terms indeed involve different conceptions. By a beautiful city we fully either mean an aggregation of things retaining their original position form, as in Nuremberg, Rothenburg, Reges, and many another ancient town at mediæval town which retains its ent atmosphere is not beautiful?; we mean the replanning and re-elling, the erection of fine buildings, pleasant spacing out of hitherto cested and wasted areas, and so on, in Paris or Vienna. The aesthetic ication of the term would, of course, regard to these two types carry ous values; in neither case would it y precisely the same thing, although would be susceptible of explicit ysis. But to talk of the city beautiful ke talking of the Elysian fields, spiration or a figment of the imaginay; and this no doubt was the idea to be conveyed by those who first it. But the term has been used abused out of recognition. To the city it probably suggests some imita- of the so-called quaint and pictur- in planning and building, which ivered a perfectly natural develop- in older cities, and presently it serve as a trade description for less purposes, if indeed it has not dy done so. In any case, a certain osity is attached to the phrase, and far we are in agreement with our ican friend in his protest against its erminate application.

THE threatened destruc- tion at the hands of the speculative builder of the city and natural charms of Pewley n, Guildford, once again raises the ion of the need for a green girdle d London. This hill, which is some t. above sea level, commands one of most varied and beautiful views in y, extending from Hindhead on the and to Leith Hill on the other. The ic has hitherto enjoyed uninterrupted s to the whole of the hillside, which favourite resort of the townsfolk of iford. The owner has always been ag to consider proposals for acquiring and for the public, and in 1906 gave own of Guildford an opportunity of using it. Although obligations just ed into in other directions prevented iford from considering the offer, it is hoped that circumstances may now re propitious, and that, with a new road and wooden fence across the is a proof of the urgency of the case, own may at the last moment be able ve the situation. But if natural y must be destroyed, at least ordered rtistic beauty should replace it. If iford cannot afford to preserve this in its present condition, it would, we me, be competent for its Corporation uire and develop it on Town uing or Garden Suburb lines as a ue-producing scheme. This, at any

rate, would save it from the sordid ugliness that would otherwise most probably be its fate. But, although Guildford is more immediately concerned, London also has an interest and some responsibility in the matter, for the Surrey Downs are its natural breathing-space and playground. If, owing to the conditions which obtain in an old civilisation, it is hopeless to expect that London will ever emulate the large American cities and obtain control over the whole of its southern heights as a step towards such a green girdle as is already possessed by Vienna, it certainly appears feasible to preserve the view-points and the woodland tracts along the crest of the whole range of the Downs, and so obtain a continuous series of drive-ways and reserves of incalculable benefit to the metropolis.

PARIS NOTES.

THE amenities of Paris are as much disturbed as London by the pulling up of roads and the erection of hoardings; but the proposal to deface the Place de la Concorde by placing within its area the exits and entrance, with an exterior balustrade, of a station for a new line of the Metropolitan is scarcely likely to be carried into effect. The outcry of public opinion would be too great. The Parisians are proud of their finest "place," and are not likely to permit any vandalism of the sort. They say that if a station is necessary in the neighbourhood it can very well be placed in a secluded position adjacent to the Tuileries gardens. The original layout of the Place de la Concorde, as designed by Gabriel, was not carried out completely, but as it is it remains one of the principal ornamental features of the city. Public squares do not, we believe, come within the regulations which could secure their classification as historic monuments; but we are glad to see the announcement that another work of Gabriel has just come within the operation of this regulation. It is not perhaps until recent years that l'Ecole Militaire, designed by this architect, has obtained the attention which it deserves for its architectural qualities. It is now included in the itinerary of most English students visiting Paris. It was one of the first works for whose design Gabriel was solely responsible, although it was constructed under the charge of another architect. The present wings were added in 1855.

The number of original drawings and sketches which are practically lost sight of in the great museums and libraries of both France and England must be enormous. They possess value not only as independent works of art, but as documents which throw light upon an artist's processes in the creation of his completed work; and many of them are of an architectural character. Students, therefore, will be particularly grateful to M. Fijalet, the Director of the National Museums, for his scheme to reserve rooms in the Louvre for the exhibition of selections from the 40,000 drawings or prints which are in the care of the Museum. It is proposed to show from time to time either the drawings of a particular period or those of a certain artist or of a certain school. We dare say that these exhibitions will lead to discoveries which may help to unravel some knotty points in connexion with architectural biography and history.

The epidemic which has prevailed in France for some time, and which involves the theft or destruction of pictures and other works of art exhibited in the public galleries seems to be spreading. The theft of Leonardo's "Mona Lisa" from the Louvre was probably the most serious instance; but there have since been many others. The worst of the business is that the malefactor is rarely discovered. The arrest last month

of G ry-P  ret, who stole two Phoenician statuettes from the Louvre in September, 1911, is an exception. The arrest took place in Egypt, and his extradition has been demanded. But quite recently four pictures at Versailles have been cut with a knife; a celebrated picture in the Gallery at Nancy has been seriously burnt by, it is presumed, a lighted cigar; an important painting of Christ, by Domenico Costi, has disappeared from l'Eglise de la Mis ricorde, at Livourne, and there are numerous other unfortunate instances of the kind.

When the Parisian laughs he laughs heartily, although always perhaps with a touch of malice. The autumn Salon has provided him with his latest joke. The result is rather a curious position of affairs. While some of the most eminent critics and one or two of the more serious French journals are developing theories on the Futurists, Cubists, and other exponents of the Post-Impressionist movement, whose works have found a place on the walls of the Grand Palais, other writers are recommending the exhibition as a cure for hypochondria and neurasthenia on account of its mirth-provoking qualities. It is possible that these curious art manifestations may be laughed out of court; there is nothing so deadly as ridicule. The Post-Impressionists themselves are probably accepting the ridicule in a spirit of martyrdom. The incompetents among them probably prefer being laughed at to remaining entirely unnoticed.

PICTURE EXHIBITIONS.

THE autumn season for the exhibition of pictures is now in full swing, and the galleries of various societies, as well as those of the well-known dealers, are giving us, we presume, of their best with varying degrees of success. In a general way the autumn shows of the societies rarely attain the standard of the earlier exhibitions of the year. The thirtieth exhibition of the Royal Institute of Oil Painters, recently opened in Piccadilly, shows little sign of age; the Institute would seem indeed to remain pretty much where it first started! Much has happened in the world of painting, in the British school as in others, since this corporation of painters was first organised, at a time which was not a very interesting period (although never more popular) for British art. In the galleries at Piccadilly this late Victorian influence largely predominates. But we do not wish to do the Institute any injustice, for its exhibition contains many works of first-rate quality. Mr. Lavery, who is ubiquitous, shows some of his later studies of pretty seaside bays. Like Mr. Sargent, Mr. Lavery would seem of later years to have forsaken his commissions for portraits to indulge in a personal predilection for the charms of natural scenery. Both artists have apparently become a little tired of a *m tier* which either their circumstances, talent, or clients had, more or less, imposed upon them. But while Mr. Sargent discovers his pleasure in the more tumultuous aspects of Nature, in its cascades and rocks, Mr. Lavery finds it in the tranquil seas off the Lido, or in some other seaside resort of Southern Europe or North Africa. His pictures of this type are growing in interest, and the two which he shows at the Piccadilly Galleries indicate greater freedom in the Lavery formula than others which we have recently seen elsewhere. Mr. Reginald Frampton, in his large picture of Saint Christopher, follows some of the old masters in his choice of subject; the saint bears in the person of the infant Christ "the burthen and weight of all this unintelligible world." The symbol of this passage of the legend does not make it quite suitable for pictorial representation, because the giant form of the saint has actually to bend under the weight of a small child. We feel this difficulty—the difficulty of conveying a symbolic idea in terms of actual representation—in regard

Ghent Exhibition, 1913: The British, Belgian, and French Pavilions.

to Mr. Frampton's composition, which is otherwise powerful and attractive. In the same artist's two small pictures of Alpine scenery the mountains are resolved into a decorative form and pattern without losing any of their natural impressiveness. This departure from the merely photographic resemblance of this romantic scenery is interesting, and we should like to see some more ambitious attempt by Mr. Frampton of the same kind. Mr. Glyn Philpot is vague and mysterious in "The Paschal Light," in which the sombre interior of a cathedral is partly illumined by the candles carried by a group of processional priests. The vigour and freedom of Mr. Edgar Bundy's costume pictures is well represented in his "Welcome." The character of the landlord of the inn, as well as that of the soldiers whom he is welcoming, is an admirable evocation of cavalier times, and provides an illustration of a possible episode. The only picture which Mr. Lee Hankey has sent to the exhibition is chiefly interesting for the variety of technical methods employed in its composition; here he leaves the canvas bare, here incrustates it with paint with the palette knife, here employs smooth brushwork. The whole effect is perhaps a little fragmentary, but this humble interior with the mother and child shows also an honest attempt at interpretation, however curious the process of the artist's construction. Miss Gloag, in "The Yellow Coat," achieves one of her audacious studies in colour, which are always a relief to the monotony of the more conventional formulas of the average picture-gallery; while Mrs. Betty Fagan's large picture of a group of children at their morning tub was probably painted for the purposes of reproduction. Mr. Hughes Stanton, Mr. Bertram Priestman, Mr. Terriok Williams, and Mr. Louis Sargent all show interesting work. Mr. Frank Salisbury has sent his design for a large panel for the Houses of Parliament. Apart from a view of St. Paul's from the river by Mr. Arthur Bell, a fountain at Versailles by Mr. Forrester, and a "La Salute" (viewed from the west of the Grand

Canal) by Mr. Arthur Streeton, we did not observe any pictures of architectural interest.

If at the exhibition of the Royal Society of British Artists in Suffolk-street there are no pictures of greater individual merit than at the galleries in Piccadilly, the general effect is more animated, although it is not equal to the spring exhibition. The President, Sir Alfred East, contributes some typical landscapes, pleasant transcripts of Nature interpreted with a grace and facility, if not with very much depth, to which we are accustomed. The art of Sir W. B. Richmond has never perhaps found happier expression in recent years than in his pictures of the hills and valleys of Italy, and his view near Urbino is a very good example of his work in this direction. "A Florentine Podere," by Mr. L. W. Lang, is an ingenious composition of brilliant contrasts of vivid colour, in which the detail is carefully elaborated. Mr. Frank Salisbury, who seems to be fortunate in his commissions for large decorative paintings, shows the sketch of an historical scene designed for a panel for the Royal Exchange. The two landscapes by Mr. Alfred Hartley, "In Cornwall" and "Down Along a Somerset Valley," provide spacious schemes of colour in which everything inessential is subordinated to a broad, general effect. There is little of architectural interest at the exhibition. The general design of Mr. Richter's picture of St. Paul's from the river, with a mass of busy shipping in the foreground, is good, but his colour is ineffective and hard; while the church of the Madonna del Sasso at Locarno loses nothing of its picturesque quality in the handling of Mr. Boot.

At the Leicester Galleries there are at the moment three one-man exhibitions. The collection of the sketches of the late Mr. Phil May are admirably representative of the artist, and would seem to have lost none of their quality of freshness in the years which have passed since their first reproduction in the pages of *Punch*. Mr. May's skill in pen-drawing was not less than his remarkable gift for the humorous observation of character,

which has certainly never been equalled by any *Punch* draughtsman except Charles Keene. No modern painter possesses a similar intuition for the possibilities of colour to be found in a hayrick or an old barn than Mr. Clausen, or indeed in rural life and the generally. The small exhibition of some of his recent works (we presume) at the Leicester Galleries include studies in still life, and studies in virtuosity, which are well worth observing for their technical accomplishments. Mr. Clausen is indebted for his method to some of the scientific painters of the French school, but his outlook is not controlled by his method; the sentiment of country obviously appeals to him for its own sake as well as for a subject for prismatic ornamentation. The third artist of the individual group represented at these galleries is Mr. Arthur Rackham, who shows a series of water-colour drawings designed to illustrate "Æsop's Fables" and "Peter Pan." The quaint and fanciful art of Mr. Rackham finds admirable expression in these drawings, and perhaps his exhibition would have gained more had he been represented by a smaller number of illustrations.

THE GHENT EXHIBITION, 1913.

PREPARATIONS are in active progress at Ghent to secure for the Universal and International Exhibition next year the co-operation of exhibitors and the public. The promises to be important, and, although building industries will not be represented specially, a variety of attractions will be arranged.

The Exhibition, which is under the patronage of the King of the Belgians, will be opened in April simultaneously with the famous Quinquennial Flower show promoted by the Société Royale d'Agriculture et de Botanique de Gand. When it is mentioned that the azalea and rhododendron hall will cover about 3½ acres, and that the hothouse for orchids will occupy 2 acres, it will be seen that the Exhibition will be on a large scale. The total area will be about 250 acres.

Ghent Exhibition, 1913; Palais de l'Horticulture et des Fêtes.

M. Van de Voorde, Architect.

While Ghent, the city of twenty-six miles, is celebrated for its artistic and historical resources—and Sir Ernest Cassel is among those who have perpetuated its picturesque beauty—the commercial activities of the city are innumerable, and visitors will find permanent as well as temporary attractions.

Ghent, the capital of the Province of East Flanders, is situated on the confluence of the Scheldt and the Scheldt. It is 34 miles by rail from Brussels, and is connected with the sea by the Terneuzen Canal. Communication with England is thereby established for commercial and general purposes. There are miles of docks, and the harbour is capable of holding 400 vessels.

The railway line runs through the Exhibition grounds, and the new station of Ghent St. Peter, with Brussels to the east and London to the west, is already in use. The building is an imposing structure, with a lofty tower to mark the entrance, and has a frontage extending about 1,000 ft. The waiting-halls and offices are well planned. Every facility is afforded for local and long-distance traffic. Tramways are also being built.

The 27 acres set aside for the industrial exhibits are nearly covered. The British, French, and Belgian palaces are already completed. Steel construction and ferro-concrete have been used extensively, and in the opinion of many experts the total effect will be finer than the Brussels Exhibition of 1910. The setting is more spacious, and the surroundings are good.

The architect for the exhibition buildings is Professor Van de Voorde, of the University of Ghent.

The Horticultural Palace will be a permanent structure, and should be a valuable acquisition for Ghent. The span of the roof is said to be one third wider than that of the Crystal Palace. This building is in the form of a vast cross, the long stem of which represents the horticultural show proper, and a broad transverse section, when fitted for seating, can be adapted into a magnificent theatre or concert-hall. The whole space may be utilised, however, for horticultural displays when required.

While special prominence will not be given to building appliances (the Exhibition at Leipzig, May-October, covering this ground), it is anticipated that the British display at Ghent will include machine tools, radial drills, pneumatic and electric tools, radial mills, compressors, pumping machinery, saw-sharpening machinery, belt-screwing and nutting machines, ball bearings, feed-water meters, water-power plants, pumps, power lammers, drilling machines, shafting and power transmissions, double helical and reduction gears, magnetic clutches, lathes, planing and shaping machines, driving chains, drop forgings, engines, electric lighting and pumping plants; crushing, grinding, green-separating, dust-collecting, and ventilating machinery; woodworking machinery,

St. Christopher's Church, Sneinton, Notts.

Mr. F. E. Littler, A.R.I.B.A., Architect.

oxi-welding apparatus, belting, and similar features.

The Board of Trade will secure for British exhibitors the most favourable rates of carriage, arrange for cartage, send an erecting staff, undertake decorations, and provide show-cases, window-dressers, and signs. All these items, which have been found a costly business for the exhibitor, are now dealt with by the Board of Trade, and are

included in the space charges. Valuable help will be given by the Government's expert Engineer, who will see that suitable concrete foundations are provided of sufficient strength, and extreme precautions are being taken to avoid risk from fire.

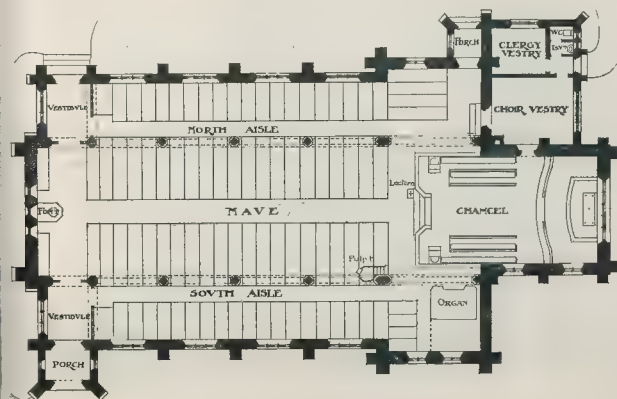

The London office of the Ghent Exhibition, 1913, is at 1, Southampton-row, where particulars may be obtained.

AN EMINENT COLONIAL ARCHITECT.

ARCHITECTURE in South Africa lost one of its chief practitioners by the death, on September 3, at Salisbury, Rhodesia, of Mr. Francis Edward Massey, F.R.I.B.A.

Mr. Massey was articled in 1875 to his father, the late Philip E. Massey, A.R.I.B.A., and in 1878 entered the office of Alfred Waterhouse, R.A., with whom he worked for about fifteen years. He became a student at the Royal Academy Schools in 1885. In 1887 he won the Soane Medal and 50% of the Royal Institute of British Architects, the subject for the year being "City Police-courts and Police-station for a Provincial Town." He also won a Medal of Merit in the Tite Prize Competition in 1888 (subject, "A Post-office"; won by Mr. G. Kenyon). In 1889 he was awarded a Medal of Merit in the Owen Jones Studentship Competition, won that year by Mr. H. V. Lanchester, and in 1891 another Owen Jones Medal of Merit, with 56.58. Mr. Francis W. Bedford being the winner on this occasion. He travelled in Italy and France in 1890-1890.

With this exceptional training, and with prospects of the brightest, he went, in 1896, to South Africa, where his life-work was founded. He went into partnership with Mr. Herbert Baker in 1897. In association with Mr. Baker he designed and carried out numerous buildings

in and about Cape Town, among them being the Cathedral; the Union Parliament Buildings; the Diocesan College, Rondebosch; the Churches of St. Barnabas, St. Michael, and St. Philip; the City Club; the premises of the National Mutual Life Association of Australasia, of the South African Association, and of the Guardian Assurance Company; the laboratories of the South African College; the Rhodes

Building; the De Beers Consolidated Mines Building; the Administrative Building for the De Beers Explosives Works; and the Seamen's Institute. Many private houses were built during the partnership; also the Dale College Buildings, Kingwilliamstown, and the Mother Cecile Memorial Hall, Grahamstown. After 1910 Mr. Masey practised independently, examples of his work being the Salisbury

Club, Rhodesia; the Salisbury Board of Executors Building; the Bulawayo Museum; and the Church of St. John, Bulawayo; and the Educational Buildings for the Beit Trustees at Bulawayo and Salisbury. Mr. Masey was selected, with two London architects, to submit designs for the new Salisbury Cathedral.

In 1901 Mr. Masey was elected a Fellow of the Royal Institute of British Architects, his

St. Christopher's Church, Sneinton, Notts.

posers being Messrs. Arthur H. Reid, Herbert
er, and Alfred Waterhouse.

In 1899 the South African Society of Archi-
s was founded to follow up the work of the
neering and Architectural Association of
th Africa, a body which, founded in 1884,
e to an end in 1886 with the discovery of
Transvaal Gold Fields. Among the Com-
ee of the new Society were Messrs. A. W.
ermann, Arthur H. Reid (now Hon.
etary R.I.B.A. for South Africa), and C. H.
th, A.R.I.B.A., with Mr. Massey as Hon.
etary. The country was in an unsettled
e, and it was not until December, 1901,
the South African Society of Architects
an to acquire power. Mr. Herbert Baker
nwhile had been elected to membership. In
r, 1902, the name of the Society was changed
the Cape Institute of Architects, with Mr.
n Parker, F.R.I.B.A., as President. Alliance
y the parent body in London was arranged
907, the year in which Mr. Massey became
ident.

Following a visit to the Mediterranean, Mr.
ey contributed to the R.I.B.A. *Journal* in
1910, an essay on "Some Thoughts upon
Possible Origin of the Doric Order of Greek
itecture." In January, 1911, he read a
ar before the Rhodesia Scientific Association,
titled "Zimbabwe: An Architect's Notes."
was published in pamphlet form, and re-
ed a visit to the ruins undertaken in 1909
he request of the Rhodesia Government.
sides being occupied with the details of his
ession, Mr. Massey took a large share in the
ation and management of the Architectural
ety, which was established to promote the
ation of architects and the progress of
itecture in South Africa. He will be missed
a large circle of intimate friends, and his
x will find a place in the annals of the
ny. The deceased was fifty-three years of

Home Place, Warwickshire.

Mr. Harrison Fielding, Architect.

The exterior of the church is built in red
sanded-faced bricks and Coxbench stone, the
roofs being covered with tiles. In the interior
the stonework is executed in light mottled
Alton stone, the varying tints of red and grey
giving a pleasing effect.

The cost of the building was about 7,000l.
Mr. F. E. Littler, A.R.I.B.A., of Nottingham,
was the architect.

A FLAT-ROOFED HOUSE.

THIS house is being erected on a wooded
upland commanding distant views to the north
and west. Standing in the path of the heavy
winds these quarters produce, the house
seemed to demand some evidence of protection
and security, and a somewhat severe treatment
has been given the building. Much of this,
however, is relieved by panels and diaper work
of coloured mosaic.

The entrance hall is approached across a
paved courtyard, and leads on one side to the
dining-room and kitchen offices, and on the
other through a panelled screen to the living-
hall, with drawing-room, study, gun and
billiard rooms adjoining. The study has a
small staircase to a dressing-room over. Lead-
ing from the dining-room is an open-air room
for meals, and flanking the house on the opposite
side is a garden-room. The latter is provided
with glass screens, and can be converted into
a winter-garden in cold weather. On the first
floor are ten bedrooms, dressing-rooms, lava-
tories, etc.

The whole of the roofs are flat, being con-
structed of concrete covered with asphalt, and
on a lower and secluded portion of them a roof-
garden is to be formed whence one will be

Home Place, Warwickshire.

Mr. Harrison Fielding, Architect.

able to look down on the surrounding country spread out like a map. A five court is being arranged on another portion of the roof, also a tank for storing the rain water. The architect is Mr. Harrison Fielding, of Bedford.

THE WESLEYAN HALL, WESTMINSTER.

An interesting constructional drawing is shown on p. 471, giving the framing for the lantern, which occurs at the top of the main dome. It will be seen that the only steelwork consists of four rolled steel joists—one being placed at each corner—and some small channels, which occur as horizontal ties; the remainder of the construction being of timber well framed together with bracketing for the various moulded features. This is an excellent drawing, and exhibits a thoroughness on the part of the architects, Messrs. Lancaster & Rickards, which is far too often lacking in our modern work, where there is a great tendency to avoid the preparation of detailed constructional drawings and to leave these to the contractor or sub-contractor who is appointed to execute the work. The principle of the framing is sufficiently explicitly shown on the drawing to need no further explanation. The building was fully illustrated in our issues for October 11 and 18.

ARCHITECTURAL SOCIETIES.

Bristol Society of Architects.

A conversation, which inaugurated the opening of the Bristol Society of Architects' winter session, was held at Church House, Clifton, the residence of the President, Mr. G. H. Oatley, F.R.I.B.A. Amongst those who availed themselves of the President's invitation were Messrs. J. Foster Wood, F.R.I.B.A., and Mowbray A. Green, F.R.I.B.A., Vice-Presidents; Messrs. G. C. Awdry, F.R.I.B.A., W. L. Bernard, F.R.I.B.A., G. C. Lawrence, A.R.I.B.A., T. H. Weston, F.R.I.B.A., Austin B. Botterill, A.R.I.B.A., and B. Wakefield, Lic.R.I.B.A., members of Council; Messrs.

C. D. Ruding Bryan, J. H. Cavell, J. R. Edwards, E. H. Gibbs, A. R. Gough, A.R.I.B.A., A. Harford, C. A. Rowley, Lic.R.I.B.A., C. E. Skinner, T. H. Skinner, J. H. La Trobe, F.R.I.B.A., and C. F. W. Dening, Lic.R.I.B.A. (Hon. Secretary). During the evening a number of sketches and photographs—the outcome of the Saturday afternoon sketching tours—were on exhibition, those contributing being Messrs. C. D. Ruding Bryan, J. H. Cavell, A. R. Gough, F. H. Weston, T. H. Skinner, and C. F. W. Dening. Mr. Harvey Pridham lent a number of his drawings of Gloucestershire fonts. The President, in the course of a short address to students, emphasised the value of sketching, and offered to present a prize as an incentive.

Royal Institute of the Architects of Ireland.

A special meeting of the Council of this Institute was held at the Institute Rooms, No. 31, South Frederick-street, Dublin, on Monday last. In the absence of the President, the Vice-President, Mr. R. Canfield Orpen, B.A., occupied the chair, and there were also present: Messrs. G. P. Sheridan, J. H. Webb, H. Allberry, C. H. Ashworth, L. O'Callaghan, W. Kaye-Parry, F. Batchelor, F. G. Hicks, and C. A. Owen, Hon. Secretary. A considerable amount of correspondence was dealt with. The conditions governing the competition for the design of the new Municipal Offices for the Dublin Corporation were considered, and the Hon. Secretary was instructed to communicate with the City Treasurer about several points therein.

THE SURVEYORS' INSTITUTION.

The programme for the first half of the coming session has been tentatively fixed as follows:—

November 11, 8 p.m.—Presentation of the portrait of the late Sir Edward Boyle, K.C., M.P., etc., by his son; presentation of the Gold Medal for the best paper read during the session 1911-12; the opening address of the President, the Hon. Edward Strutt.

November 25, 8 p.m.—"Land Values

Taxation: A Criticism of the Evidence Before the Departmental Committee on Imperial and Local Taxation," by E. M. Konstam, barrister-at-law.

December 16, 5 p.m.—"The Value and Marketing of English Timber," by M. C. Duchesne, Fellow.

January 13, 1913, 8 p.m.—"Notes on the Mortgage of Real Estate," by A. Laurence Cox, Fellow.

January 27, 1913, 8 p.m.—"The Amendment of Rural Building By-laws," by W. Woodward, F.R.I.B.A., Fellow, and "Some Urban Housing Problems," by M. Price Holmes, Fellow.

ENGINEERING SOCIETIES.

Institution of Civil Engineers.

The Council of the Institution of Civil Engineers have made the following further awards for papers read during the session 1911-1912:—A Watt Gold Medal to Professor W. H. Burr (New York), and the Crampton Prize to Professor R. J. Durely (Montreal). They have also awarded the following Telford premiums for papers published in the *Proceedings* without discussion during the same session:—To Messrs. Paul Seurot (New York), David Anderson and Harry Cunningham (London), S. P. Smith, D.Sc. (Birmingham), E. G. Rivers, I.S.O. (Richmond), and E. H. Morris (Manchester), and Professor A. H. Gibson, D.Sc. (Dundee). The Howard Quinquennial Prize for 1912 has been awarded to Mr. J. H. Darby (Sheffield) in recognition of improvement introduced by him in iron and steel production, and the Indian Premium for 1912 to Mr. H. G. Mitchell (Madras).

The Council have made the following awards in respect of students' papers read during the session 1911-1912:—The James Forrest Medal and a Miller prize to Mr. E. P. Currall, B.Sc. (Birmingham); and Miller prizes to Messrs. J. H. Taylor (Glasgow), W. P. Warlow, B.Sc. (Bristol), G. Ingram (London), E. F. Hunt, B.E. (London), H. J. F. Gourley, B.E. (London), H. G. Hoskings (London), E. A. Cross, B.Sc. (Birmingham), and J. & W. Legg (London); and the James Prescott Joule Medal to Mr. V. E. Green (Birmingham).

GENERAL NEWS.

Professional Announcement.

Mr. John Brooke, F.R.I.B.A. and President of the Manchester Society of Architects, of 18, Exchange-street, Manchester, has taken into partnership Mr. C. Ernest Elcock, late of J. M. Porter & Elcock, of Colwyn Bay, and for the future the practice will be carried on under the style of "John Brooke & Elcock."

Buckingham Palace Front.

In Wednesday's Parliamentary Papers Mr. Bennett-Goldney asked the Hon. Member for St. George's-in-the-East, as representing the First Commissioner of Works, if the design of the proposed new front to Buckingham Palace had been approved by the First Commissioner of Works or by any responsible body of architects or artists; whether the drawings for the proposed elevation have been submitted to the present President of the Royal Institute of British Architects, to any Committee of that body, or to the President of the Royal Academy; whether, if the proposed new front is paid for out of a memorial fund, the Government will have any control or supervision over the work, and whether this House will be permitted to have an opportunity of expressing an opinion upon the designs before they are finally decided upon; whether it is proposed to allow any competing designs to be sent in for selection from any other architects of high repute; and, if not, whether any of the demerits of some of the more recent architecture at present disfiguring the other end of the Mall are likely to be repeated in the new front of the palace.

Mr. Wedgwood Benn said the design has been approved by the First Commissioner of Works. It had not been submitted to any other person or Institute, but the Office of Works would maintain complete control and supervision of the work. It was not proposed to ask for any other design.

Designs of Public Buildings.

In the House of Commons Mr. King asked the Prime Minister, on Tuesday, whether his attention has been called to the criticism usually directed to designs accepted and plans adopted for public buildings and other undertakings by his Majesty's Office of Works; and whether, in order to give public confidence in the work of that department and to ensure the best value, taste, and style in all future public works, he is prepared to introduce some method of securing the best possible advice and general approval, either by appointing a representative consultative committee or otherwise.—The Prime Minister, in reply, said the First Commissioner is responsible for the designs of all public buildings, the erection of which devolves upon his department, and he is satisfied that, so far as ordinary buildings are concerned, no useful purpose would be served by the appointment of a consultative committee such as that suggested. The First Commissioner feels that he can rely with confidence upon the experience of his trained staff. In the case of exceptional buildings, such as the War Office and the new public offices, it has been the practice to seek the assistance of architects of eminence outside the department.

Royal Commission on Ancient Monuments.

In the House of Commons Capt. Murray asked the Prime Minister whether he was aware that at the present rate of progress the labours of the Royal Commission on Ancient Monuments would in all probability take some forty years to complete, and that within that period a vast number of monuments would have perished or have been restored beyond recognition; and whether, in these circumstances, he would consider the advisability of adding to the staff of the Commission in order that the work might be finished within a reasonable period.—The Chancellor of the Exchequer, in reply, said:—"It is hoped that the Ancient Monuments Bill now under consideration of a Joint Committee of both Houses may be amended so as to enable the Office of Works and its Official Inspector of Historical Monuments to deal with imperilled monuments as cases arise, and I shall be prepared to consider any proposal that may be made for adding to the expert investigating staff employed by the English Commission."

Calton Prison, Edinburgh.

In the House of Commons Mr. Wedgwood Benn, for the First Commissioner of Works, has informed Mr. Hodge that there is a project under consideration for removing Calton Prison, Edinburgh, and using the site for Government offices. Details were not yet worked out, for no buildings could be commenced before the matter was laid before Parliament. In any designs for new buildings care will be taken to preserve the amenities of Edinburgh.

St. George's Hall, Liverpool.

The Council of the Royal Institute of British Architects, at their meeting on the 14th inst., passed the following resolution, a copy of which was forwarded afterwards to the Liverpool City Council:—"The Council of the Royal Institute of British Architects has seen with regret the City of Liverpool's plans for altering the southern termination of St. George's Hall. The Council believes that alterations to such a building are only justifiable when inevitable, and trusts that, in view of the widespread opposition of architects to any interference with St. George's Hall, the City Council will reconsider the matter."

Our Austrian Municipal Visitors.

The visit last week to the City and the Corporation of London of Dr. Josef Neumayer (Bürgermeister of Vienna), Herr Franz Leithner (Bürgermeister of Bad Ischl), and Herr Karel Gros (Mayor of Prague), with sixty other representatives of those municipalities, terminated with a farewell banquet on Friday evening at De Keyser's Royal Hotel. The programme included visits to the Tower and Tower Bridge, lunch at Leathersellers' Hall, a reception at the Austro-Hungarian Embassy, and a dinner at Vintners' Hall on Tuesday; visits to the City of London School, Guildhall School of Music, St. Paul's, and the Central Criminal Courts, lunch at Messers' Hall, and a state banquet at the Guildhall under the presidency of the Lord Mayor on Wednesday; visits to the Metropolitan markets, the National Gallery, and British Museum, luncheon at the Mansion House, and a visit to the Houses of Parliament on Thursday; and on Friday visits to Burnham Beeches and Windsor Castle, where they took tea in the Orangery by invitation of the King.

St. James's Club House, Piccadilly.

Some additions are about to be made to the premises of the St. James's Club at the corner of Brick, formerly Exmoor, street, by Messrs. Maple & Co., Ltd. The house stands on the site of the old Greyhound Inn; it was originally styled Coventry House, having been sold by Sir Hugh Hunklock for 10,000 guineas to George, sixth Earl of Coventry, who married the beautiful Miss (Maria) Gunning. It was afterwards occupied by the Ambassadors' Club, who dissolved in 1854.

Arlington-street, St. James's.

A notable house in this thoroughfare will be offered for sale at the Mart on October 29. It is No. 5, on the east side, being the second home of Robert Walpole and his son Horace in that thoroughfare, whereof Horace writes, in 1768, to Montagu:—"From my earliest memory Arlington-street has been the ministerial street." Horace Walpole was born, 1717, in a house that stood opposite; his father removed thence in 1742 to No. 5, and the son quitted No. 5 for Berkeley-square (corner, north-west, of Bruton-street) in 1779. His father's first home in the street, as rebuilt by Kent, for Henry Pelham, was since Lord Yarborough's; the drawing-room is depicted in the second scene of Hogarth's "Marriage à la Mode." A tablet has been affixed to the front of No. 9, the residence in 1804-6 of Charles James Fox.

Relics of Volta.

Sir Henry Norman, M.P., has found in an "antiquities" shop in a small Italian town what he believes to be a genuine collection of the electrical appliances which Volta made for his experiments that led to the discovery of "voltaic" electricity, together with the original one-fluid primary battery—Volta's "crown of cups," and many personal and domestic articles used by him, as also some of his papers, letters, portraits, etc. It appears that these objects have passed from father

to son, having been bequeathed by Volta to his cook and body-servant, who was the uncle of the present owner's grandfather. Sir Henry Norman suggests that in the event of their authenticity being established the apparatus, appliances, and other articles might be purchased for presentation to the Royal Institution.

Property Sales.

The landed properties recently placed in the market comprise the following:—No. 1, Quadrille Court, Lymington, modernised under the directions and superintendence of Mr. S. J. May, F.R.I.B.A. The early XVth-century manor-house, known as Hergest Court, with 418 acres, at Kingston, co. Hereford, mentioned in "Malvern Chase," and occupied for nearly three hundred years since 1430, by the Vaughans and their descendants. The Wilderness, Earley, near Reading, and White Knights Park, formerly belonging to the Duke of Marlborough. Breccles Hall, Norfolk, 3,000 acres, of which the record begins in 1276, when the land belonged to John de Breccles; the house, built by the Woodhouses, being of the Elizabethan period. The Grove, Chigwell, Essex, a residence, reputedly, of Sir Francis Drake. Norton Priory, Seley, an interesting Tudor house, by Pagham Harbour with earthworks in which ancient British remains have been found. Birnam, on the south bank of the Tay, near Dunkeld, where the famous wood has been replanted with fir, the traditional scene of Macduff's encampment being at Court-hill in the vicinity; and The Oaks, with 180 acres, near Banstead, a house that gave its name to an historic race, having been a hunting seat of the Earl of Derby and containing some fine work by the brother Adam. The house was originally built by the Hunters' Club for their resort in the hunting season; Edward, twelfth Earl of Derby, made large additions to the house and stables.

BOOKS.

Modern Sanitary Engineering. Part I.: House Drainage. By GEORGE THOMSON, M.A. M.Inst.C.E. (Constable & Co., Ltd. 1912. Pp. xv. and 266. Price 6s. net.)

THE author of this book remarks in his Preface that it is not so easy to find books which are based on general principles, and which lead from these to practical applications, as it is to find those which tell merely how work is usually done. With this in mind he has endeavoured to give, first, a general indication of the requirements of a system of drainage to deal next in some detail with the special requirements of the different parts and with the way in which these are met; and then to consider how these parts are to be combined into an effective whole. The intention is not simply to indicate what is the usual practice but to consider the reasons which have led to that practice.

The result is an excellent book which the student would do well to read; it will save him a good deal of doubt when afterwards studying text-books which give only what is actually done in order to comply with by-laws.

The author was, we believe, one of the witnesses who gave evidence before the Departmental Committee, appointed by the Local Government Board to consider the Disconnecting Trap, whose Report, published since the book before us went to press, was noticed in our issue of September 13. He refers to the subject of that Committee's investigations and expresses as his own the view that the question of the retention of the disconnecting trap is one chiefly of workmanship, and that if "really tight drains" were universal the intercepting trap would be useless. He also appears to see no objection to the ventilation of sewers by house soot pipes. "So soon, therefore, as we reach standard of construction which will allow the abolition of the main trap without risk, a soon should that trap be abolished." Possibly he might modify this after seeing the Committee's expressed views that the ventilation of sewers is a matter the importance of which is much over-estimated, and that the question of "smell" is not to be put aside as of moment. Even with the present arrangements a whiff of air from the disconnecting house drain occasionally is blown into our bedroom windows or drawn down our chimneys and it is offensive enough. How much worse

would it be if the soil ventilating pipe were directly connected to the practically inexhaustible source of offence existing in the sewer. If the hint of the Report were taken, we should retain the interceptor and the high "outlet" vent and do away with the low "inlet" vent which is so often a real and constant nuisance, arranging our pipes with a view only to prevention of siphoning and to the provision of a certain limited amount of ventilation.

These questions are carefully dealt with by Mr. Thomson in the course of his earlier chapters. Then, after discussing the conditions governing the various fittings usually met with, a couple of chapters are devoted to the designing of complete systems of drainage and to the peculiar requirements of certain special classes of buildings. Then follow some forty-three pages devoted to tests, testing, and sanitary inspections; the particulars here given are of especial value, as they are to be found in very few of the ordinary text-books. Finally the disposal of sewage from isolated houses is dealt with, and the book is completed by a very good index.

Estimating, being the Analysis of Builders' Prices. By THOMAS D. L. PYER. With forty illustrations. Part I. (Portsmouth: The Ubique Press, Ltd., 1, Middle-street.)

WHATEVER criticism may be passed on this work, want of thoroughness will certainly not be one basis for fault-finding. For detail it is one of the most complete works we have ever had under consideration. If such may be deemed a fault, one might complain that the author has entered rather too much into detail. It is, however, easy to drop some of this detail, and, probably most of those who use this work in their studies will do so.

The work is evidently for provincial use, and those who have had experience with what may be termed "country" pricing of quantities will welcome anything that may tend to put him on a more satisfactory footing. The prices given for labour and upon which the work is based are 5½d. per hour for labour and 1d. per hour for skilled trades, except mason, which is given at 9d., and plasterers at 8d. and 1s. These strike us as low even for country towns of any size.

Notwithstanding the low prices for labour and a some cases of materials, the prices for work generally are little, if any, lower than those of good London builders in competition—e.g., 15s. per yard cube for cement concrete, six of broken brick to one of cement, and 14s. 10s. per rod or reduced brickwork, notwithstanding the fact that he bases his prices upon a bricklayer and labourer laying an average of 700 bricks a day of ten hours, although we do not think there are many even in the provincial towns who work ten hours a day. We think, however, his average on page 100 not quite correct if his initial figures are. He takes an average between 1,000 per day for footings, 800 for 1½-brick walls, and 500 for 1-brick walls. By simply averaging these figures he allows that there is as large a proportion in footings as in the remainder. This we are confident would not be borne out by experience.

We point out these little matters as showing that while his results may be right, according to London standards, the working seems somewhat at fault, and we think it is somewhat unfortunate that a London basis was not adopted for rates of wages. But while we could criticize the work on these grounds we must congratulate the author upon his most painstaking and careful work, a study of which will be most useful as an introduction to the analysis of prices for building work. Observation as to the time taken in various works being largely the basis of pricing, it would be a good idea if the student with this work before him verified some of the examples given.

We shall look forward with a good deal of interest to the continuation of the work, the art under notice taking us only to the end of to bricklayer's work.

Workmen's Compensation Digest. By DOUGLAS KNOCKER. (London: Butterworth & Co. 1912. xxvii., 455, and 39 (index) pp.)

THIS work contains every case of present validity or authority decided under the Workmen's Compensation Acts (1897, 1900, and 1906) and Rules in the House of Lords and the Supreme Court of Judicature in England up to May 15, 1912, and reported either before or since, and also every such case

decided in the Scottish Court of Session and the Supreme Court of Judicature in Ireland, and reported up to May 15, 1912. It therefore gives every decision, whether English, Scottish, or Irish, which might be of use to those who are interested either as litigants or advocates in the great field of legislation with which it is concerned. The arrangement of the book is all that could be desired. The actual text of the 1906 Act is first set out, and then under every word or phrase which has been the subject of judicial decision or comment are given all the cases relating thereto. In some instances extracts from the more important judgments are quoted by way of illustration of the principles which the Courts have applied in their interpretation of the Act. The learned author in his Preface makes an apology for the fact that he has arranged the various cases in parallel columns so as to show at a glance those which have been decided in favour of the workman and those in favour of the employer. Though, as the author himself admits, such an arrangement is, on principle, indefensible, in that the general application of the rule forces on to one side or other of the dividing-line cases which may not definitely favour either the employer or the workman, at the same time, in our view, the great practical convenience of the arrangement more than compensates for this disadvantage. The completeness and up-to-date character of the digest renders it invaluable to employers of labour, who will certainly be able easily to learn from its pages how and in what circumstances liability towards their workmen arises. There is a good table of cases, and a very useful index, and space has been left for the noting-up of subsequent cases as and when they are decided. We can with confidence recommend the volume not only to architects, builders, and other employers of labour, but also to all who are in any way concerned with the law and practice of workmen's compensation.

Engineering and Metallurgical Books, 1907-1911: A full Title Catalogue, arranged under subject headings, of all British and American books on Engineering, Metallurgy, and Allied Topics, published during the five years 1907-1911, with their English and American prices and publishers' names. By R. A. FENNIE. (London: Grafton & Co., 69, Great Russell-street. 1912. Pp. ix. and 206. 7s. 6d. net.)

MR. FENNIE deserves thanks for this continuation of his useful, though probably irksome, labours. The scope of the work is well indicated by its title, and a glance through its pages gives a very good idea of the directions in which mechanical studies are for the moment being particularly directed. For instance, under the heading "Aeronautics" fifty-one works are mentioned, including a "Bibliography of Aeronautics" which itself contains a total of 954 pages. Motor boats, motor-cars and motor cycles are separately dealt with, but together account for fifty-five books, to say nothing of books dealing especially with details of ignition devices, internal combustion engines, magnetos, carburetors, etc., which are classified separately. Reinforced concrete, too, continues to inspire many, so that the author has to make fifty-two entries under this head. The subject headings of the groups are placed alphabetically in the body of the book, and a classified list of these subjects is placed at the beginning. At the end is an index of authors, editors, translators, etc.

The book is clearly printed and adequately cross-referenced, and will doubtless save much time to many who wish to see at a glance what recent literature is available upon any of the special subjects dealt with.

Redress by Arbitration. By H. FOULKES LYNCH. Fifth Edition. By ARTHUR REGINALD RUDALL. (London: Eppingham Wilson. 1912. 8vo., xv. and 102 pp.)

THE first edition of this little digest of the law relating to "Arbitration and Awards," by the late Mr. H. Foulkes Lynch, was an excellent attempt to supply a handy book for consultation pending arbitration proceedings, and also to provide an elementary text-book on the subject for the use of law students. The aim of the author was entirely successful,

and the work has certainly proved its usefulness to all concerned in arbitration matters, whether as arbitrators, parties, or advocates. The editor of the fifth edition has adhered to the original form, and has only made such additions and alterations as lapse of time and other circumstances have rendered necessary. The growing disinclination of commercial men to submit their difference to the decision of the Courts, and the consequent increasing tendency to seek redress by arbitration rather than by action, renders this work more valuable than ever. Architects and surveyors should find it extremely useful. There is a good table of contents, and an alphabetical list of the cases cited. The Appendix contains a sufficient number of forms for all ordinary purposes, and the index is quite adequate.

The Land Transfer Problem. By J. S. RUBINSTEIN. (London: Spottiswoode & Co. 8vo., 68 pp.)

THIS is a paper read at the thirty-seventh provincial meeting of the Law Society, held at Cardiff, September 24 and 25, 1912, which discusses fully the respective merits of the systems of registration of deeds or registration of titles as solutions of the land transfer problem. The author has on several previous occasions read similar papers on the subject, which have been mainly concerned in proving that, owing to our condition of land tenure, the attempt to introduce a workable land transfer system by the abolition of deeds and by substituting in their place the system of registration of title has failed, and was bound to fail. Mr. Rubinstein approaches the question as a solicitor, and succeeds in making out a very good case for his contentions. Without expressing any opinion of our own as to the particular views enunciated, we think that Mr. Rubinstein's brochure is well worth perusal by all who are interested in land tenure and the problem of land transfer in this country.

CORRESPONDENCE.

The Architecture of the New Delhi.

SIR,—I learn from the articles in your issues of the 11th and 18th inst. on "The Architecture of the New Delhi" that an interesting discussion as to what should be the character of the architecture of the new city is being carried on. May I, as an Anglo-Indian missionary of twenty-one years' standing, be allowed to make a humble contribution to it?

I do not profess any special knowledge of architecture, but it seems to me that as this new city of Delhi marks a new departure in Indian history, and stands neither for Hindu nor Moslem supremacy, but as a commemoration of the Coronation of a greater Emperor of India than ever reigned in the past, its architecture should be as distinctive in its own way as was the case in previous centuries whenever a new conquest took place and a new Delhi was built, or an old Delhi was modified, so as to mark the event.

Mr. Havell has already advocated that the new city should be built in some indigenous style, and such a proposal will readily meet with the approval of many. But, whilst indigenous styles undoubtedly have the merit of being Oriental, they necessarily carry with them the idea of the supremacy of one or other of the great religions of India, which in this case does not apply.

It appears to me that the main idea to be kept in mind is that of Christian Imperialism, and if we desire that the architecture of the new city shall be emblematic of the actual facts of the situation which necessitates the building of a new city at all, this idea may be developed along one of two lines—the New Delhi may stand (a) either for British Sovereignty and the Christian religion, or (b) for an embodiment of the same idea underlying the principle of religious neutrality, which is the foundation upon which the "Pax Britannica" has always stood, and which would be best expressed in some eclectic style of architecture which would speak of universal brotherhood and of the fusion of all religious thought into one world-wide recognition of the Fatherhood of God.

How to embody such ideas in architecture must, of course, be left to experts and the

task may not be easy. All I would emphasise is this—the New Delhi, built by the British Government in 1912, must be no mere reproduction, however beautiful or stately, of a Delhi which some Rajput or Mogul conqueror might have built a few centuries ago—it must have a distinctive architectural message of its own for the people of India and for future generations.

If architecture can write "sermons in stone," perhaps the inspiration for the right ideal may be found in Tennyson's lines, where he represents Akbar the Great as having had a dream, and as seeing the realisation of his religious aspirations in the coming of the British and in the gradual advance of Christianity—

I watched my son,
And those that follow'd, loosen, stone from stone,
All my fair work: and from the ruin arose
The shriek and curse of tram'd millions, even
As in the time before: but while I groined,
From out the sunset pour'd an alien race,
Who fitted stone to stone again, and Truth,
Peace, Love, and Justice came and dwell therein,
Nor in the field without were seen or heard
Fires of Duties, nor wall of baby-wife,
Or Indian widow: and in sleep I said
"All praise to Allah, by whatever hands my mission be
accomplished!"

It might also be borne in mind that India is now passing from its Renaissance into a fuller life of liberty and progress. Some adaptation of the styles of architecture which marked the same period in the West might not be inappropriate, and such would certainly give the distinctive character to the New Delhi for which I plead.

I feel sure there are British and Anglo-Indian architects well able to deal with technical data of this kind, and I hope that the best men will be encouraged to put forth their best efforts, as the opportunity is altogether unique.

J. P. HATTHORNTWAITE,
Late Principal of St. John's College, Agra.

The Church of St. Thomas, Portsmouth.

SIR,—In the interesting notice of this church which appeared in the *Builder* of October 18 there is no mention of a singularity in the planning of the choir, to which, as it makes the building one of the most interesting in the history of architectural development in England, it may be worth while to call attention.

The feature in question is briefly that, while the side aisles of the choir are divided into four bays, the central division is for purposes of vaulting treated as two only, each pair of pier arches being grouped together to form one great square vaulting compartment above. This peculiarity, though it is by no means uncommon on the Continent, is shared in England by the neighbouring Boxgrove alone, and the treatment of the scheme is precisely the same there, namely, that each pair of pointed pier arches is comprised in a great semicircular arch whose tympanum masks the triforium, while the double bay of clearstory above is lighted by a single lancet, central in position, and therefore placed above the intermediate pillar of the arcade. The only difference between the two buildings is that Boxgrove is of better material and richer and more refined detail.

No doubt one of these buildings was a replica of the other, and as the detail at Portsmouth follows that of the western bays at Boxgrove, which are plainer and later than the eastern (*Builder*, April 7, 1900), it is probable that it is the copy.

It is not a little curious that of these two churches the remote Boxgrove should be so well known and that at Portsmouth so little that no writer on English architecture has, as far as I can ascertain, mentioned it or known of its existence. Even Mr. Francis Bond says that "We have only one example of this system—the choir of Boxgrove Abbey."

A. H.

Cross Traffic.

SIR,—The method of traffic mentioned by O. B. I. T. in your issue of the 18th inst. was brought before the London County Council as long ago as 1897 by Mr. Holroyd Smith, M.L.Mech.E., who then proposed that the gyratory system of regulation should be tried at Ludgate-circus.

The suggestion of your correspondent that Oxford-circus should now be selected as "an ideal spot for an experimental application," is,

no doubt, an original idea, but as a matter of fact the proposal was made by me in my Presidential address of 1907 to the Civil and Mechanical Engineers' Society. At that time I strongly urged the desirability of experiments not only at Oxford-circus, but also at Ludgate-circus and St. George's-circus—all these being equally suitable.

Your readers may be interested to learn that the subject was discussed once more this month at a meeting of the Society of Engineers (Incorporated), and that in consequence of the discussion there is a probability that an experiment will be made at Solihull-circus, Letchworth Garden City, where a large number of vehicles would readily be obtained for the purpose of a practical demonstration.

I should be pleased to receive communications from any of your readers who are interested in the subject and who would be prepared to co-operate in promoting a public demonstration or series of demonstrations in the interests of the public.

W. NOBLE TWELVETREES.

195, Bedford-hill, S.W.

London District Surveyors' Fees.

SIR,—Referring to the note on page 457 under the heading "Westminster City Council," the whole matter has been very badly placed before the public.

When a large building is altered the fee under the Act, 1894, is equal to half the fee for a new building, but in every case the District Surveyor charges an abated fee in proportion to the work done. Thus in the case of a fee legally chargeable, 45*l.*, for a small alteration the surveyor charged 2*l.* The matter started in consequence of an alteration to a town hall in South London, and the Borough Council did not approach the District Surveyor in the proper way, or he would have charged a nominal fee.

Generally, the fee is proportionate, and no better system can be devised.

AN OLD SURVEYOR.

"A Limited Competition."

SIR,—Early in the month of August the Beckenham District Council advertised in the professional journals for architects to send in their names to enable the Council to select a limited number to submit plans for the new schools. Ninety architects have been selected, and it strikes one that the professional assessor is much to blame for taking part in such a waste of time and money.

The gentlemen sending their names naturally expected that six or eight would be selected.

FAIR PLAY.

[** We have referred to the advertisement in question, which appeared in the *Builder*, where we find it stated that "the competition will be limited to architects who have had considerable experience in the planning of public schools." This does not convey the impression of a *limited competition* in the sense in which our correspondent has taken it, but we think that the advertisement might have been more carefully worded.—Ed.]

Labour in Sydney, New South Wales.

SIR,—In July last a paragraph appeared in the Press stating that people in Sydney were starving, owing to their inability to find work. I at once sent this out to my correspondent near Sydney, and have just received his reply, the substance of which I give you below. As the information is reliable (the writer is the manager of a bank) . . . I think you would interest and inform your readers by printing this letter.

W. BECKER SMITH,
Twenty-five years Assistant and Emigration Secretary to the Y.M.C.A.,
Manchester.

The following are extracts from the letter:—

"DEAR SIR,—I have read the paragraph which speaks of people in Sydney being unable to find work. As a matter of fact, master-builders still tell me they cannot get a sufficiency of labour. The demand for boys for indoor labour is remarkable, because each establishment prefers to train its own staff. . . . The class of men you send out find employment without much trouble. Of course, I refer those in the building trade to local builders, and I do not hear subsequently that they failed to get employment. I am in touch with employers of all kinds, and they report

the same scarcity of suitable labour. New farms are coming into existence every day, and call for unlimited labour for clearing, fencing, building, and working. Hence men able to work need have no fear as to getting employment.

R. D. A."

FIFTY YEARS AGO.

From the *Builder* of October 25, 1862.

Evil Efforts against Sanitary Improvements.

RECENTLY an inquiry which has been made by the *Lancet* into the effects of railway travelling on health has caused the expression of a variety of opinions in various journals. Amongst other singular views it has been stated that the pure air of the sea-shore is of little value as regards health; and one writer in an influential magazine states that impurities of air do not sensibly affect health, as is seen by the thousands who daily breathe impure air with impunity. It is said that the air of a crowded railway-carriage, which is so close that it is noxious and unpleasant to the senses, can do no harm; and that, although the air may in this way be tainted, "the rapid circulation of the air always suffices to keep up a due amount of oxygen; and, however oppressive the sensation of 'stiffness' may be when windows of a crowded carriage are closed, the utmost physiological effect is a lowering of the respiration and a consequent lowering of the vital functions, which immediately recover their activity on fresh air being admitted."

. The latest opinion regarding such conditions as are above set forth is contained in an address prepared by Dr. Leonard Hill, M.B., F.R.S., and Dr. Martin Flack, M.A., M.B., and delivered before the Royal Society of Arts, February 7, 1912, and later before the British Association, from which we make the following interesting extracts:—"The good effects which result from efficient ventilation and open-air treatment are generally supposed to be due to the chemical purity of the air. They are really due to the movement, coolness, relative humidity of the air, and to the ceaseless variation of these qualities. . . . We are convinced that there is no positive evidence which demonstrates the poisonous nature of the condensation water obtained from the breath. We go further and say there is at present no trustworthy evidence of the existence of any such poison in the exhaled air. The increased percentage of carbonic acid and diminution of oxygen which has been found to exist in badly-ventilated churches, schools, theatres, barracks is such that it can have no effect upon the incidence of respiratory disease. . . . In a crowded room the air confined between the bodies and the clothes of people is almost warmed up to body temperature and saturated with moisture, so that the cooling of the body by radiation convection and evaporation, becomes almost impossible. . . . The blood is sent to the skin and stagnates there instead of passing in ample volume through the brain and viscera. Hence arise the feeling of discomfort and fatigue. . . . There is yet another aspect of ventilation—bacterial infection. Catarrhal infections are spread by the explosion of droplets of saliva when speaking, coughing, or sneezing. A current sufficient to drive out such droplets cannot be borne by the inhabitants of a room. A moderate ventilation current tends to keep such droplets suspended in the air. In a still room they soon fall to the ground, and clinging to floor and furniture, may be wiped up next morning and removed by the housemaid. We cannot hope to prevent infection in crowded railway carriages, theatres, chapels, schools, etc. The epidemics of common colds that sweep through the community show this only too well." We are thus face to face with the dilemma that a closed window conduces to a diminished functional activity, while an open one adds to the chances of bacterial infection.—Ed.

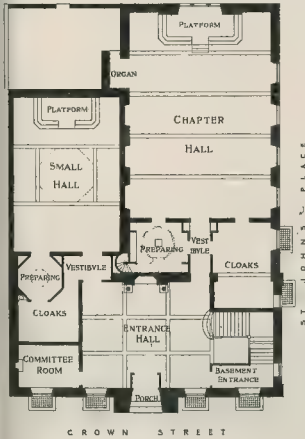

Masonic Temple, Aberdeen : Entrance Hall.
Mr. Harbourn Maclellan, Architect.

ILLUSTRATIONS.

Masonic Temple, Aberdeen.

THIS building was opened in January, 1911, with full Masonic ceremony, the Marquis of Tullibardine being the central figure. The architect was Mr. Harbourn Maclellan, of Aberdeen.

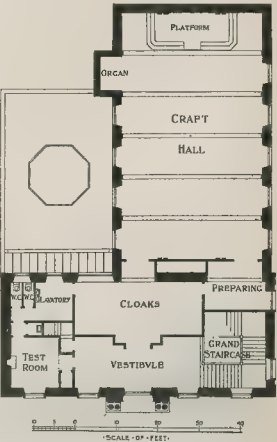

Masonic Temple, Aberdeen : Ground Floor.
Mr. Harbourn Maclellan, Architect.

Our illustrations show the chief features of the Temple.

The mason work was executed entirely in white Kemnay granite, all dressings and carvings being performed by means of pneumatic chisels. The inside panelling, furniture, and carving are nearly all of Austrian wainscot oak slightly fumed and wax-polished. The floors of the entrance-hall, corridors, etc., are of marble tesselæ, black and white marble squares, and cube marble mosaic. The ornamentation and details are based on Masonic symbols, including the large Zodiac floor in the entrance-hall. The heating is by low-pressure hot water with Ideal boiler and air-inlet radiators, and the extraction of foul air is effected by means of a Blackman electric fan and ducts. The plaster-work is finished in Duresco. The electric lighting is specially designed for Masonic ritual, and is controlled by Watkin switches. The following were the contractors—of Aberdeen except where stated otherwise: Mr. Edgar Gauld, mason; Mr. Geo. Jamieson, carpenter; Mr. Geo. Farquhar, slater; Mr. D. Ogilvie, plumber; Messrs. Roger & Baxter, plasterers; Mr. Geo. Bisset, steelwork; Messrs. W. Briggs & Sons, Ltd., Dundee, asphalters; Mr. E. Copland, glazier; Messrs. Chud Hamilton, Ltd., electricians; Messrs. J. Cormack & Sons, Ltd., Glasgow, heating engineers; Messrs. Jas. Bannochie & Sons, marble and tile work; Messrs. J. & A. Ogilvie, oak joinery, carving, and furnishings; Mr. John Whyte, painter. The bronze figures were cast by Mr. A. B. Burton, Thames Ditton; the electric fittings by Messrs. G. E. Coy, Ltd., London. The sundial and cast lead-work were by Messrs. Geo. Wragge, Ltd., Manchester; the locks and mountings by Messrs. R. Langebeare & Co., Birmingham; and the sanitary fittings by Messrs. Shanks

& Co., Ltd., Barrhead. The bronze figures and fibrous plaster were modelled by Mr. W. H. Buchan, Aberdeen. Mr. Derwent Wood, A.R.A., modelled a life-size bust of ex-Lord Provost Wilson, Aberdeen, which was cast in bronze by Messrs. Singer & Sons, Frome, its destiny being the entrance-hall of the building.

Masonic Temple, Aberdeen : First Floor.
Mr. Harbourn Maclellan, Architect.

A Country House near Guildford.

This house occupies a secluded site within easy reach of Guildford, in Surrey. It has a symmetrical elevation to the entrance front, while the south or garden elevation is grouped together by two gables, being in sympathy with the broad Georgian outlines of the north front.

The arrangement of the plan is simple, and needs no further explanation. The materials used for the elevations are rough hand-made red tiles for the roof. The walls are in rough-cast. The quoins and chimneys are built of small hand-made red brick. There is a formal garden, which has also been designed by the architect, Mr. R. F. Johnston, of 1, Brook-street, Hanover-square, W.

"Two Gables," Burnham, Bucks.

The house called "Two Gables," of which elevations and plans are given, has the great advantage of a site beautifully timbered.

The elevational design has been largely governed by the client's desire that the north and south fronts should present a distinct contrast, yet be in perfect sympathy. On the garden or south front there is a quaint little court sheltered between the two main gables. This court, which is paved with old flagstones and has a grass surround, is raised three steps from the garden level, with a small lead figure in the centre. Thin hand-made red bricks are used for the chimneys and lower part of the gables on the south front. The walls generally are treated in rough-cast, and the roofs are covered with rough hand-made red tiles from Reading. The half-timbered gables are of oak left perfectly rough and unstained in any way. The timbers vary in width from 7 in. to 9 in., and are studded with oak pins. A small plan is shown of part of the formal garden. The architect is Mr. R. F. Johnston, of 1, Brook-street, Hanover-square, W.

The Architectural Treatment of the Head of the Serpentine: Kensington Gardens.

This was the subject set in the recent competition for the Architectural Association Silver Medal, which was awarded to Mr. R. M. Pigott.

The restrictions imposed consisted of leaving untouched all adjacent paths, both in level and direction, and retaining the original position for the pump-house on account of the well.

In this design an attempt has been made to emphasise the length of the pools by placing tall yew hedges on either side, these forming avenues about 25 ft. wide and 230 ft. long. The plan has been arranged on axial lines, giving many pleasant vistas, while the connexion between the fountains and the Serpentine is retained somewhat on the lines of the present lay-out, thus allowing the semicircular colonnade to act as a suitable termination to the lake.

The flower-beds are intended to be of the herbaceous type, while all the paths are laid down in flagstones.

MEETINGS.**FRIDAY, OCTOBER 25.**

The Institution of Municipal Engineers.—General meeting, 8 p.m.
The Royal Technical College Architectural Craftsmen's Society, Glasgow.—Mr. W. H. Baxter on "Some Effects of Recent Legislation on the Building Trades."
Royal Sanitary Institute.—Mr. W. E. Fretwell on "Details of Plumbers' Work," 7 p.m.

COMPETITION NEWS.

A list of current Competitions is printed on page 490.

The Quadrant, Regent-street.

As stated in our advertisement columns this week, the Committee appointed by the Lords of the Treasury to consider the design for completing the rebuilding of the Quadrant, Regent-street, desire to inspect the designs which were submitted in the recent *Builder* competition. Competitors who prepared designs for that competition are accordingly invited to forward them to Mr. W. Fidler, Secretary to the Committee, 1, Whitehall, London, S.W., not later than Monday, November 4. Each design should be accompanied by the name and address of the sender.

Municipal Buildings, Dublin.

Mr. Albert E. Murray, A.R.H.A., F.R.I.B.A., is the assessor in the competition for the new Municipal Buildings, Dublin.

New Municipal Offices, Goole.

Mr. Ernest E. Fetch, A.R.I.B.A., has been awarded the first and second premiums (30l. and 15l.) for his two designs sent in for the new Municipal Offices, Goole. The assessor was Mr. C. B. Flockton, F.R.I.B.A.

A Unique Opportunity.

We print without comment the following advertisement from a newspaper, omitting the name of place, etc., addressed "To Architects":—"The Committee of the . . . invite tenders from fully-qualified architects for preparing schemes for developing a site

at . . . upon which they intend erecting a library, institute, billiard-room, swimming-bath, etc., at an estimated cost of 5,000l. The architects sending in their tenders are to submit two prices:—1st, for preparing plans, specifications, personal supervision of the work, and all necessary details required in the carrying out of the scheme, and also for the preparation of the bills of quantities; 2nd, for carrying out the whole of the work above mentioned with the exception of the bills of quantities. The Committee reserve the right to accept the tender of an architect for carrying out the whole of the work, exclusive of the preparation of the bills of quantities, and to appoint a separate quantity surveyor to take out the bills of quantities. The Committee do not bind themselves to accept the lowest or any tender. . . ."

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, S.W., Lord Chelmsmore, Chairman, presiding.

Lambeth Bridge.—A recommendation was made by the Improvements Committee that application should be made to Parliament, in the session of 1913, for authority to reconstruct Lambeth Bridge as a steel arch bridge 48 ft. wide, at an estimated cost of 240,000l. The Committee in presenting the report accompanying this recommendation, referred to the circumstances under which a similar scheme was rejected by Parliament. The main objections to the scheme in Parliament were that the amenities of the Houses of Parliament would be affected by the architectural design of the bridge, that the bridge was too narrow, and that the proposed gradient (1 in 20) was too steep. The Committee stated with reference to the first objection, that the estimate included 20,000l. for the decoration of the bridge, a sum which they had been advised was sufficient to allow a satisfactory scheme of architecture. Referring to the question of width, it was stated that the bridge was not part of a main traffic route, and it would be useless to construct a bridge wider than 48 ft. unless Horseferry-road, which is only 40 ft. wide, were widened its whole length. Difficulties in decreasing the gradient were also pointed out and this appeared to the Committee satisfactory, having regard to the rapidity with which mechanical traction has superseded horse traction.

The Committee's recommendation was adopted.

St. Paul's Bridge.—The Highways and Improvements Committee presented a joint report recommending that authority be sought in the session of Parliament for 1913 for construction of tramways from Southwark-street over the proposed new St. Paul's Bridge to a point near the most western end of Cheapside, together with a shallow underground subway. After a short discussion the further consideration of this question was postponed till the next meeting of the Council.

MONTHLY REVIEW of ENGINEERING.

Fig. 1. Derwent Valley Waterworks: General Plan.

DERWENT VALLEY WATERWORKS.

LAST month the great waterworks undertaking known as the Derwent Valley Scheme was formally inaugurated by the official opening of the lines so far completed.

The works have been under construction the period of about twelve years, the cost to date having been three and a half millions in round figures. As the entire undertaking involves a total expenditure of ten millions it will be understood that a very large amount of construction work still remains to be executed.

The project is the outcome of the proposals made in 1896 by the corporations of Derby, Leicester, and Sheffield for the control of the upper waters of the River Derwent and its tributary, the Ashopton. Each of the bodies mentioned was anxious to acquire for itself the rights in question, and, in addition to mutual opposition of these three, all of them were opposed by the corporation of Nottingham and the County Councils of Derbyshire, Leicestershire, and Nottinghamshire. After the matter in dispute had been referred to a Parliamentary Committee the various authorities were advised to submit a joint scheme. This was done, and resulted in the passing of the Derwent Valley Act of 1904, establishing the Derwent Valley Waterworks as the controlling authority.

The total yield of water is estimated at 15 million gallons daily, and supplies will be distributed in equitable proportions to the various authorities concerned, the ultimate supplies being approximately as follows:—

Leicester	9½ million gallons.
Derby	6½ "
Sheffield	6½ "
Nottingham	3½ "
Derby County	5.0 "
Nottingham County (until 1909)	1.0 "

The ultimate scheme includes the construction of five reservoirs for impounding the waters of the rivers Derwent and Ashopton,

about 100 miles of aqueduct for distribution of the water to various constituent authorities, some 15 acres of filter beds at Bamford, and a service reservoir at Ambergate.

Three of the impounding reservoirs will be on the River Derwent, and are described as the Howden, Derwent, and Bamford reservoirs, while the remaining two will be on the River Ashopton, and are described as the Hagglee and Ashopton reservoirs. For the first instalment of the works, however, only the Howden and Derwent reservoirs are required.

In the subjoined table we give particulars of the reservoirs and dams:—

DERWENT VALLEY RESERVOIRS AND DAMS.

Name of Reservoir.	Watershed Area.	Reservoir Area (Full).	Reservoir Capacity.	Water Level Above O.D.	Reservoir Length.	Dimensions of Dam.	
						Height.	Length.
	Acres.	Acres.	Mill. Gals.	Ft.	Miles.	Ft.	Ft.
Howden	9,321	157	1,940	870	1½	118	1,070
Derwent	3,389	153	2,000	776	1½	114	1,110
Hagglee	10,967	178	2,160	808	2	136	980
Ashopton	1,257	141	1,472	675	2	103	840
Bamford	6,482	242	2,495	885	2½	95	1,850

The main aqueduct connects the Howden and Derwent reservoirs with the service reservoir at Ambergate, the course of this conduit having been diverted on the recommendation of the Engineer to the Water Board, Mr. Edward Sandeman, M.Inst.C.E. The alteration, which was sanctioned by Parliament in 1904, had the effect of reducing the length of the aqueduct by 1½ miles. Further, by permitting the mains to be carried over higher ground, the alteration justified the use of thinner pipes than would otherwise have been necessary, the result being the saving of some 6,000 tons of cast-iron.

Fig. 1 is a plan showing the main features of the complete project, by which it will be seen that the impounding reservoirs are grouped on high ground in the Peak district.

The watershed, having an area of 50 sq. miles, lies at an elevation of from 500 ft. to 2,000 ft. above sea level, and the average rainfall is about 46 in. As the watershed is practically uninhabited, the water is of excellent quality as regards purity, and, as usual in the case of moorland collecting grounds, it is free from hardness.

The compensation water to be returned to the rivers in accordance with the decision of

Parliament is equal in amount to one-third of the total available supply, leaving more than 33 million gallons at the ultimate disposal of the Water Board.

After the appointment of Mr. Sandeman as Engineer to the Board in 1900, and the revision of the original project, the first item of work undertaken was a construction railway 7 miles long from the Midland system at Bamford to the site of the Howden reservoir. This line starts about half a mile west of Bamford Station, and runs up the western side of the Derwent Valley, terminating at the Howden dam. It has a maximum gradient of 1 in 40, and a ruling gradient

Fig. 2. Derwent Valley Waterworks: Howden Dam.

of 1 in 100. Three valleys are crossed on timber trestle viaducts, the largest being 70 ft. high by 750 ft. long.

The offices for the engineering and clerical staff of the Water Board are established at Bamford, close to the junction between the Midland Railway and the branch line mentioned above.

At Birchinlee, halfway between the Howden and Derwent dams, a village was built at a cost of 32,000*l.* to accommodate the workmen and their families. The buildings are of timber covered with corrugated-iron and lined inside with boarding.

In addition to dwelling-houses the village includes a village hospital, an isolation hospital for infectious diseases, a canteen, a doss-house, a school building, used for religious worship on Sundays, and a public building containing a large recreation hall, reading-room, billiard-room. The hall is provided with a stage, for the purposes of concerts, dramatic performances, and other entertainments. The village also contains public baths, and is provided with water supply and drainage systems. The population in February last was about 960, but was reduced to 765 in August this year.

The principal works included in the first instalment of the system are:—The Howden and Derwent reservoirs; the pipe line from Howden to Derwent, 1½ miles long; the main aqueduct from Howden to Ambergate service reservoir, comprising 3·7 miles of 6-ft. 3-in. tunnels, 7 miles of cut and cover, and 17·4 miles of 45-in. diameter pipe; an aqueduct from Ambergate to Sawley, a distance of 46 miles, this conduit being of 40-in. diameter pipes as far as Coxbench, near Little Eaton, where a branch is taken off by the Derby Corporation, and of 33-in. diameter to the Trent at Sawley; and a 29-in. pipe line, 8 miles long, from Ambergate to Langley Mill for the supply of Nottingham. The instalment also includes short branches for conveying the Sheffield supply to the entrance of a tunnel constructed by the Corporation of that city at Lady Bower, and to take the Derby supply from Coxbench to Little Eaton; and the Ambergate service reservoir, the Little Eaton service reservoir, and the Bamford filter beds.

The Howden and Derwent dams are of masonry, and generally similar in design and construction. We give in Figs. 2, 3, and 4 elevations and photographic views of the Howden dam, and from these illustrations it may be seen at a glance that the work is highly creditable to the engineer, Mr. Sandeman, and his architectural adviser, Mr. W. Flockhart, F.R.I.B.A.

We think we ought to congratulate Mr. Sandeman on realising, as he evidently did, that in a great work of this character it was necessary that proper architectural expression should be given to it, and the result of the collaboration between engineer and architect in this case proves Mr. Sandeman's wisdom in this direction.

Both of the dams were carried out by administration in preference to contract, and are built of millstone grit in large rough blocks, the spaces between which are filled with 1 : 6 concrete, and the upstream and downstream sides are faced with dressed millstone grit.

The stone was obtained from Grindlesford, about 6 miles from the Derwent dam, and was brought to the site by rail. This stone possesses the important advantages of being easily quarried, economically worked, and of hardening on exposure to the weather.

The foundations of both dams are in the Yoredale series of the carboniferous system, consisting of alternate beds of shale and sandstone, the strata being broken and distorted very considerably below the surface of the ground. Consequently it was necessary to sink the foundations to the great depth of 63 ft. below the river bed in the case of the Howden dam, and, as the rock was not watertight, a narrow trench, 6 ft. wide, was excavated on the north side of the foundation to the depth of 125 ft. below the river bed, and filled with concrete so as to form an impervious apron to prevent the percolation of water below the main body of the dam.

Further, as the hillsides were found in 1908 to be anything but watertight, wing trenches have been sunk for a distance of

about 1,000 yds. along each side of the valley filled in with concrete, and connected up to the watertight apron. These wing trenches are 5 ft. wide and range from 70 ft. to 190 ft. deep.

At the Derwent dam a similar foundation apron was formed and carried into the hillsides for a distance of 500 ft. at each end of the dam to prevent water from working its way round.

Construction on the Howden dam was commenced in November, 1901, and on the Derwent dam in July, 1902. The material excavated was removed partly by cranes and partly by the aid of cableways. The latter were erected essentially for the purpose of feeding the cranes with stone and concrete after building work had begun, but it was found convenient to employ them in connection with the work of excavation.

Two cableways were provided at each dam, the longest spans being 1,525 ft. between supports. The cables were suspended over the valley at a height of about 150 ft. above the river and passed over timber towers at either side of the valley. The main cables are of 7-in. circumference and capable of carrying loads up to 6 tons.

The towers shown in our illustrations rise 50 ft. above water level, and are in communication by means of a subway passing

Fig. 3. Derwent Valley Waterworks: Howden Dam and Reservoir.

ough the heart of the dam. In these
are situated the outlet pipes for
ly purposes and for emptying the reser-
when necessary. The valve chambers
situated in the lower portion of the
res. Similar towers are included in the
vent dam.

tween the valve towers of each dam
is a wide spillway, over which surplus
flows in a cascade in times of heavy

short distance below the site of the
re Bamford dam are the filter beds for
treatment of all water except that to be
delivered to the Sheffield Corporation. The
t comprises about $\frac{3}{4}$ acre of rough filters
4 $\frac{1}{2}$ acres of sand filters.

roughing filters contain from 12 in. to
18 in. of gravel, varying in gauge from $\frac{1}{4}$ in.
to $\frac{1}{2}$ in., and resting on perforated plates
of concrete. These filters will be cleaned
by means of compressed air on the Puch-
chal system, the air being introduced into
water below the perforated plates and
then upwards through the filtering material.
A small stream of water will carry away
impurities removed to the drains.

The sand filters contain 2 ft. of sand and
18 in. of gravel resting on hollow bricks,
the filter being provided with gauge and
automatic apparatus for recording the out-

flow passing through the two classes of
filters. The water flows into a clear-water
reservoir with a capacity of 6,000,000
gallons, whence it flows to the covered
service reservoir at Ambergate.

Situated on high ground at Ambergate,
about 1 mile south of the Derwent dam, the
covered service reservoir, with a capacity of
10,000,000 gallons, is established for the pur-
pose of controlling the services to the various
districts, and also for providing a reserve
in case of temporary interruption of the main
supply should occur.

As at present built, the reservoir forms
one of three portions of the complete
work. It measures 640 ft. long by 360 ft.
wide by 23 ft. deep from water level to the
bottom. The quantity of earth excavated
for its construction amounted to 200,000
cubic yards.

The floor and walls are of concrete, with a
topping of asphalt, and the flat roof is of
forced concrete, carried by steel beams
supported on brick columns. To facilitate
cleaning and emptying of the reservoir
division wall 10 ft. high, has been built
in the middle.

gallons each. In the second instalment
the Hagglee reservoir is included, the
Ashopton and Bamford reservoirs coming in
the third instalment.

LEICESTER CORPORATION DERWENT VALLEY WATER SUPPLY.

UNDER the Derwent Valley Water Act of
1909 the Leicester Corporation have authority
to execute local works in connexion with
the general scheme described in our previous
article.

These works were designed by and con-
structed under the direction of Messrs.
Eversard, Son, & Pick, civil engineers, of
Leicester, at a total cost of about 250,000.

As previously stated, the supply for the
town of Leicester is taken from the main
aqueduct of the Derwent Valley Water Board
at Sawley, which is 2 miles to the west
of Trent Station, the local pipe line crossing
the River Trent and passing south of
Loughborough to Hallgates, a distance of
14 miles.

At Hallgates a covered service reservoir,
with a capacity of 2,000,000 gallons, had
already been constructed as a part of the
existing waterworks system of the town, and
the storage capacity at the same place has
recently been increased by the completion of
a second reservoir of the same size.

The Leicester aqueduct in reality forms
the southern portion of a continuous pipe line,
20 $\frac{1}{2}$ miles long, from the Ambergate reservoir
to the reservoirs at Hallgates, and which
is probably the longest siphon in England.

With the exception of river, stream, and
railway crossings, the Leicester pipe line
consists entirely of cast-iron. The pipes are
in 12-ft. lengths, with a constant exterior
diameter of 35 $\frac{1}{2}$ in., the interior diameter
varying with the thickness of metal, which
is governed by the pressure to be resisted.

The socket joints were all "solid run"
with lead, an inverted ring joint having been
used for this purpose. Flange joints are
made with a gutta-percha ring in the grooves.

Two lines of pipes have been laid through
the valley of the Trent, although one is of
sufficient capacity for conveying the water
to be supplied by the first instalment of the
general undertaking. It was considered
necessary to lay the mains in duplicate owing
to the high pressure on the pipes, to the fact
that the gravels in the Trent Valley are
always saturated with water to within 3 ft.
of the surface, and to the difficulties of access
in times of flood.

After the pipes had been laid they were
tested in sections to a pressure of 50 lb. per
square inch above the static head, and it is
satisfactory to note that no breakages have
taken place in any of the pipes or fittings.

Automatic stop valves are placed at Sawley
and at Hallgates, and reflux valves are pro-
vided at intermediate points. Sluice valves
of 30-in. diameter, with a 6-in. by-pass on the
body of the valves, are fixed at distances
of about one mile apart, dead weights, relief
valves, and double air valves being placed
where required.

The river, stream, and railway crossings

Fig. 5. Derwent Valley Waterworks: Section
of Howden Dam.

briefly described above will be capable of
yielding about 13,000,000 gallons of water
daily, and the output of the second and
third instalments will be about 10,000,000

Fig. 4. Derwent Valley Waterworks: Howden Dam.

Hallgates Service Reservoir: View of Valve House.

are made in steel pipes of 30-in. diameter. In the case of the River Trent the pipes are carried upon a bridge of 220-ft. span, and small streams are spanned by the pipes themselves.

The service reservoir at Hallgates measures 200 ft. long by 106 ft. wide, and the depth of water is 16 ft. The foundations were excavated in the hard Pre-Cambrian rocks of Charnain series. This material furnished excellent aggregate for the concrete of which the walls were mainly constructed. The interior of the reservoir is lined with asphalt protected by brickwork, and the roof is formed by a series of groined arches.

We give a view of the steel bridge for carrying the pipe lines over the River Trent. This bridge, which is of the bow-string type, with vertical suspenders, crosses the river in one span of 220 ft., and allows a clear headway of 17 ft. above the normal water level, so as to allow ample headway for barges when the river is in flood.

The steel girders are carried upon brick and concrete foundation-piers enclosed in cast-iron cylinders, which are carried down to solid red marl, encountered at a depth of 21 ft. on the north side and 22 ft. on the south side below the water line. As a considerable quantity of water was met with in sinking the cylinders and removing the earth from the inside the work was finally completed with the assistance of compressed air. The bridge is designed to carry four pipe lines, two for immediate use and two for future requirements. The towing path is carried round the cylinder on steel cantilevers, the horse track being of cement covered with asphalt.

The contractors for this bridge were the Cleveland Bridge and Engineering Company, Ltd., of Darlington, by whom the work was commenced in the autumn of 1906 and finished in 1907.

The general contractors for laying the pipe lines and building the service reservoir were Messrs. Jowett Bros., of Burscough, and Messrs. R. H. B. Neal, Ltd., of Plymouth.

THE INTERCEPTING TRAP.

At the annual general meeting of the Institution of Municipal Engineers, on the 11th inst., Mr. H. C. H. Shenton read a paper on "The Local Government Report on the Intercepting Trap," in the course of which he said:—

It is probable that as a result of the evidence brought forward the Local Government Board will alter their Model By-Laws to the extent of permitting, or even of demanding, the omission of intercepting traps in house drains.

The sanitary expert and the engineer in private practice view the matter from a special standpoint. Their knowledge is to a great extent limited to the drainage of the better-class houses, and they have, as a rule, a very limited knowledge of the conditions which exist in the mass of houses of the working classes. Neither have they the drainage of whole towns and districts under their control. They are, therefore, more likely to be surprised at the conclusions of the Report than those men who have for years made a daily study of the conditions which exist in the sewers and drains of a town taken as a whole.

The private engineer who is a sanitary expert may design systems of drains perfectly, and may see to it that these are absolutely well constructed, properly ventilated, and flushed. Moreover, he will very likely be able to see that they are cleaned periodically, and that they are frequently inspected. He may take special steps to avoid the troubles which are mentioned in the Report. He may regard the blocking of an intercepting trap on his system as a thing never likely to occur, and, moreover, he will, without doubt, take such steps as will prevent any possibility of nuisance or danger to health, even if the trap does get clogged.

It is also quite reasonable to imagine that the owner of property who has spent so much money on his drainage system would object to allow the sewers, which are not as clean as his drains, to be ventilated through them, but such cases are the exception and not the rule. The sanitary expert is better acquainted with these cases than with the drainage system of ordinary houses, and arguments in favour of the intercepting trap which are based on the existence of the perfect system designed regardless of cost, have practically no bearing upon the present case.

A considerable section of the Report is devoted to the demonstration of the fact that the importance of sewer ventilation, and even of drain ventilation, is not as great as is generally imagined. Apparently there is no reason to omit the intercepting trap for the better ventilation of sewers.

There is, however, one great and absolute objection to the trap, and that is its liability to become stopped up. The evidence brought forward in the Report that this is so is overwhelming, and herein lies the need for alteration in the general practice.

There is one point with which the Report deals somewhat too lightly, in the author's opinion, and that is the value of the trap as a barrier against rats. The Report tells us that Mr. Patten Barber gave evidence to the effect that he had seen rats chased into the inspection-chamber of a drain, where they escaped into the sewer through the trap, and conversely that Mr. Woods, Sanitary Inspector of Willesden, saw three or four rats come up from a sewer through an intercepting trap.

The author has recently had experience in Kensington of rats coming up through holes in the ground on the sewer side of a house intercepter. The examination proved that the connexion was an old brick barrel of a defective nature, through which the sewer rats came. Although it was evident that the rats came up close to the intercepter, it did not appear that they had entered the house drains. The connexion has now been repaired, and it has been assumed that the trap will exclude the rats from the house drains. If rats come through traps, how is it that they are practically unknown in London houses except where the drains are untrapped? In the author's memory, in the days when intercepting traps were rare, there was another trap which was very much in evidence—viz., the domestic rat trap, which was as common then in our houses as the domestic mouse trap is now. To what is the change attributable?

Again, though the author has frequently seen rats in sewers, he has never, during twenty years' experience on and off of house drains, seen a rat on the house side of the intercepter, though in untrapped drains he has seen them.

The fact that rats have been known to pass through traps under certain conditions does not prove that the trap is, in ordinary circumstances, an ineffective barrier. It may be argued that the presence of rats in a drain, properly trapped at the gullies, is objectionable than a blocked drain, but this supposes that the trapped gullies are effective barriers. If the intercepting trap is an effective barrier, neither is the gully or the closet trap, and there is therefore every reason to expect that where there are many rats in sewer they will come into the houses. I know from experience that this is not so. The inefficiency of the intercepting trap as a barrier against rats, as stated in this Report, is therefore a point upon which further evidence is desirable.

Another question, and perhaps the most important of all, is the manner in which the traps are to be done away with. The Model By-Laws having been altered, and the authority having decided to act upon the what will then be the position? How situated in positions far apart will have to be drained. Are these houses alone to be points at which the sewers are to be ventilated?

It may well be that in a town where there are many houses without intercepting traps, ample ventilation given prevents the likelihood of any nuisance due to the escape of an undrained volume of sewer gas or smell at one point, but when, say, one house drain on a long length of sewer is to be made to ventilate the sewer, may there not be a considerable nuisance at that point? It is common experience that when a new system of sewers is put into operation smells occur at unexpected points. Sewer escapes and is noticeable at some open cesspools and the inhabitants are not slow to complain. This is quite as likely to happen at an open cover near a vent shaft as elsewhere. Theoretical principles do not seem to prevent the ventilator from acting as an outlet, or to prevent the bulk of the smell issuing at some point intended instead of at several ventilators placed for its special accommodation. Is it the same thing very likely to occur if one or two house vent pipes are used for sewer ventilation at houses, and may not the municipal engineer have to deal with complaints imaginary or otherwise, from local residents who are alarmed? The author, having considerable trouble from objections raised to purely imaginary smells from sewer vent shafts, cannot avoid the impression that the must be possibilities of trouble for the municipal engineer in the application of the new method.

Again, would it be possible to remove all the traps in the town? It would be easy to make them inoperative as traps by removing the cleaning eyes, but this would not do away with the chief danger—viz., that of stoppage. However, it would be desirable to remove the cleaning eyes as a start, rather than to make a few house drain vent pipes the only sewer ventilators.

BRIDGE RECONSTRUCTION WORKS IN THE NORWICH DISTRICT.

THE *Eastern Daily Press*, Norwich, in its recent issue gives an account of the strenuous work that has been carried on by the Great Eastern Railway engineers in the area of the memorable flood of August last. On every part of the line for some miles out from Norwich extensive operations have been necessary, pumping, repairing permanent way, strengthening embankments, and repairing or replacing bridges; but nowhere, it is stated, has more energy been demanded than in the reconstruction of the Flordon bridge. The bridge collapsed about four o'clock on August 26. On the following day Mr. H. Wilmer, Engineer for the London district, to whom the duty of reconstructing the bridge was assigned, arrived with a staff from London. They found that the three brick arches of which the bridge consisted had completely disappeared, having fallen into the river below. The two massive brick piers which carried the arches were also levelled to the ground, and there was an open space of about 100 ft. The two lines of rails, however, were suspended, and the distance from these to the water level was 35 ft.; but at that time the water was considerably above its normal level, having, on account of the flood, risen fully 9 ft. The clearing away of the debris was the first thing to be taken in hand, and this work was commenced almost

imately, sixty-two men being brought from Stratford for the purpose. The bulk of the large blocks of brickwork was laid by the use of a 4-ton steam crane, which was kept on the Forncett side. These blocks, which weighed as much as 7½ tons, were deposited alongside the embankment. After this sort of debris had been dealt with, the dropping of the overhanging rails sleepers into the stream was effected by pulling away the bolts on the embankment, allowing the whole to fall into the stream. The remnants of the track were cut into sections before being carted away. The debris on the river having been taken out—this being several days, during which it was mainly raining—the next move was to clear the stream in such a way as to keep it open for the foundations which were to be put in.

This needed some amount of consideration, immediately a clearance of the fallen bricks and masonry had been made. Mr. Wilmer was to proceed with the scheme he had prepared for getting in the substantial foundations which the new bridge was to rest. At the time the water was still several feet above normal level, and therefore the construction of a coffer dam across the stream had to be carried out on somewhat elaborate lines. After the dam had been put up a chute 12 ft. wide was laid down, and in this the water was carried to the area in which the foundations were to be laid. The water from the chute fell into a large cutting several yards in length, and had been excavated to allow of the carrying of the existing channel on either side. Owing to the many blockades in the lower parts of the stream, the water subsided very slowly, therefore to have waited until the water had reached its normal level would have meant interrupting the construction of the dam for weeks, especially as rain fell for ten days after the dam was put up.

The chute was of necessity constructed with great care, because it was absolutely necessary to ensure its being watertight. The conception of the quantity of water that would flow over the chute can be formed when it is known that it poured down continuously at the rate of 15 million gallons every twenty-four hours. Then, owing to the existence of the coffer dam, it was necessary to maintain pumping stations to keep the foundation workings dry. To do this a 6-in. special pump and pulser were employed; in this 10,000 gallons an hour were dealt with. The water difficulty having been satisfactorily solved, the laying-down of the foundations for the piers of the bridge was proceeded with. The piers were carried down below the old foundations, and to a depth of 5 ft. below the river level. Each of the two new piers which now support the bridge rests upon a block of concrete 12 ft. long, 9 yds. wide, and 2 yds. thick; each pier weighs in all over 100 tons. The piers are constructed of London bricks, faced with Portland cement, and the level of the piers is above that of the river in red brick. On the top of the piers blocks of Portland stone, 12 ft. thick and 3 ft. 6 in. wide, have been fixed; of these weighs something like 2 tons. On account of the great difficulty that was, and is being, experienced in getting ironwork, principally to the various strikes that have taken place, it was decided to use timber for the bridge. This decision was completely reconstructed was started upon, and the trusses, which were specially designed in the Engineer's department, were prepared at Stratford. They are constructed and laid down in pairs, but each separate truss carries one of the spans of the bridge. Each truss weighs 5½ tons. Each of the trusses is braced together by intermediate frames, and on the top of every two trusses are 12 ft. by 6 ft. cross-sawn timbers, making the whole width of the bridge. A concrete invert was made through the centre of the bridge for the purpose of carrying. The bridge was severely tested with the heaviest type of motor vehicles on the day previous to opening, and the trials proved most satisfactory.

MAN IRON AT CORSTOPTITUM.

SITUATED at the west of the village of Corstoptum, on the north bank of the Tyne, at a point near a Roman bridge carried Watling-street across the river, Corstoptum was an important military post, established to command the line of communication between York, the headquarters of the Sixth Legion, and the eastern end of the northern province.

Corstoptum was not an ordinary fortress, but rather a town of military character. The two buttressed granaries of exceptional size are distinctly military features, and the massive building to the east of them was also constructed for military purposes. These appear to have been intruded upon the town, thereby converting it into a large depot, a service which it probably continued to fulfil from the time when Antoninus Pius advanced northward until Septimus Severus conducted expeditions against the Caledonians.

During the recent explorations conducted at Corstoptum by the committee established by the Duke of Northumberland, Lord Ridley, and other gentlemen, one of the largest masses of Roman wrought-iron hitherto found was unearthed.

The bloom measured 39 in. long, and its transverse dimensions were 8 in. by 7 in. at the widest part, and 5 in. by 4½ in. at the smallest part. It weighed 3 cwt. 8 lb., but, being thickly coated with rust and containing much oxidised slag, the net weight of metallic iron was only about 3 cwt.

Preliminary inspection and subsequent examination at Middlesbrough showed that the bloom had been built up and welded in sections.

Professor Henry Louis expresses the opinion that the block was made by welding together comparatively small lumps of iron produced by direct reduction in small charcoal fires, adding that there is no reason why the ores used may not have been the local black-band ironstones of the carboniferous series.

The furnace in which the bloom was discovered measured about 5 ft. from the top of the wall to the hearth, and about 6 ft. in diameter. The walls were of rough stone set in common clay.

It seems to be clear that the structure was not a smelting furnace, but simply a forge employed in welding up the bloom, and Professor Louis suggests that the block of iron was intended for use as an anvil, and had been undergoing repairs or being lengthened at the time when it was left.

In an historical account of iron manufacture in the North of England, Sir Isaac Lowthian Bell points out that there is little or no doubt that the smelting or reduction of iron ore was carried on to a considerable extent in this part of the country during the Roman occupation. Vast heaps of iron scoria may be seen on the moors in the parishes of Lanchester and Chester-le-Street and elsewhere in Northumberland and Durham, and it is remarkable that none of these are very far from one or other of the Roman stations scattered over the two counties.

ENGINEERING NOTES.

In a new bridge built to carry **Erecting Heavy Two Hundred and Thirty-Girders with a fifth-street across several railway tracks in the Borough of the Bronx, New York, the roadway is carried by one centre girder weighing 84 tons and two side girders weighing 55 tons, and the footpaths are carried by two outer girders, which weigh 21 tons and 22 tons each.**

The two outer girders on one side of the bridge were erected by a steel guy derrick of 50 tons capacity, with a boom 50 ft. long. The 84-ton girder was delivered on one of the centre railway tracks, and a steel gin pole was erected by the derrick to assist the latter in the erection of the girder.

As this method made it necessary to fix the gin pole at a point where it would have interfered with railway traffic, the method was modified so that the girder was erected entirely by the gin pole by which two side girders were also erected.

Having been delivered at a considerable angle with the alignment of the bridge, the girders had to be swung horizontally through an angle of 90 deg., a requirement making the work of hoisting a delicate operation, which, although it had to be performed in short stages, was accomplished in about two minutes.

The gin pole, 65 ft. long, was seated on a special steel shoe measuring 18 in. square at the top and 30 in. square at the bottom. It was built up of four 6-in. equal angle bars at the corners, with latticed bracing, and was fitted with six 1-in. guy ropes and adjustment tackle. The hoisting tackle comprised a 2-in. steel cable,

about 1,400 ft. long, passed through two five-sheave blocks and two single sheaves at the top and bottom, both ends of the line being led to the drums of a 50-h.p. hoisting engine. The hoisting tackle was connected to a shackle lashed to the girder with two 1-in. ropes 125 ft. long, which were protected from the sharp corners of the steel by strips of timber.

THE BARRENJACK ASSOUAN DAM, THE BARRENJACK DAM.

ALTHOUGH not so large as the Assouan Dam, recently inaugurated in New South Wales, is one of the largest structures of its kind in the world. Picturesquely situated on the Murrumbidgee River, the dam is set between the base of two granite hills that rise to the height of some 2,500 ft., and form the gateway through which the river formerly flowed unrestrained.

At present the crest of the work is about 120 ft. above foundation level, but when the irrigation system for which it has been built has fully developed the structure will be raised to the height of 240 ft. above the foundations. As thus completed the dam will measure 784 ft. long, curved in plan to a radius of 1,200 ft., 240 ft. high, and with a breadth of 170 ft. at the base, and 18 ft. at the crest.

The dam will ultimately hold up the waters of the Murrumbidgee for the length of 45 miles in the long winding valley, creating a lake among the mountains, with an area of some 20 square miles, and providing for the storage of over 33,000,000 cubic ft. of water. It is estimated that, at the average flow of the river, it will take a year to fill the reservoir completely.

The area to be irrigated at once covers 125,000 acres, and will shortly be increased to 350,000 acres, while the entire scheme provides for the irrigation of 1,300,000 acres of land.

Reinforced Concrete Wharf and Jetty at Port Talbot Docks, South Wales.

THE Port Talbot Railway and Docks Company recently invited schemes and tenders for a reinforced concrete wharf and jetty for Port Talbot Docks. After investigation by Mr. W. Cleaver, M.Inst.C.E., Engineer of the Company, of the various competitive schemes, it was decided to accept the tender presented by Messrs. Watt Brothers, of Cardiff, licensees of the Coignet system. The scheme comprises a jetty for coal belt tipping appliance, having a frontage of 65 ft. and a width of 45 ft., the deck being supported by three rows of piles. The wharf has a frontage of 600 ft. length, with a width of 45 ft., and approaches 145 ft. long at each end. The deck in this case is supported by four rows of piles strongly braced together. The permanent depth of water in each case is 32 ft., with decks about 7 ft. above the permanent water level. The work has been calculated to carry three railway lines for heavy locomotives and one crane road. The scheme for the reinforced concrete work has been prepared by Messrs. Edmond Coignet, Ltd., of Westminster.

A COURSE of six Educational Lectures on "Concrete: Its Properties and Manufacture," will be given by Mr. H. Kempton Dyson, Secretary of the Concrete Institute, at 5.30 p.m., on the following Tuesdays:—November 12, 19, 26; December 3, 10, and 17, 1912. The lectures will be given in the Lecture Hall of the Concrete Institute, at Demison House, 299, Vauxhall Bridge-road, Westminster (close to Victoria Station).

The Concrete Institute.
Fire Tests of the British Fire Prevention Committee.

THE British Fire Prevention Committee conducted, on the 16th inst., a further series of fire tests in respect to roofing materials, the coverings under investigation being corrugated sheets of asbestos-cement made in Canada, and produced in such a manner that they can be applied in the same way as corrugated iron sheets whilst having great advantages as to non-conductivity against heat and fire. The roofing material under test was tested at different angles, fire being applied in different forms, such as bonfires, fire brands, etc., and certain of the roofs were also subjected to water from a steam fire-engine when they were in a heated condition. The results of the tests will be issued in about six weeks in an illustrated report, and will be known as Red Book No. 168.

THE BUILDING TRADE.

THE SECRET LAND INQUIRY.

UNDER the title "A Modern Inquisition" on October 4 we commented upon the private inquiry that has been instituted throughout the country relating to questions connected with the land, and suggested that its constitution and authority should be made clear. In answer to a question put to the Chancellor of the Exchequer by Mr. Rawlinson on the 11th inst.—"Whether a Committee has been appointed by him to obtain information for him and the Cabinet regarding the actual conditions of life and labour in Great Britain; whether, if such is the case, he will state the duties of such Committee and the names of its members, and by whom the expenses of such Committee will be defrayed?"—Mr. Lloyd George replied: "The hon. and learned Member rather magnifies the scope of the Committee; its object is to investigate the question of land reform and kindred problems." Then the Chancellor referred the questioner to the answer of the Prime Minister to another question in the House on the same day, but he added that the expenses of the Committee are being defrayed from private sources. The answer of the Prime Minister here referred to was simply a reference to a former answer he gave on July 10, and an assurance that the inquiry was not to extend to Ireland.

The answer given on July 10 to which the public is referred on October 11 was as follows:—"The Committee is a purely unofficial and informal body. It will be presided over by my Right Honourable friend Mr. Arthur Acland; I see no reason why the names of the members should be published at present. Should their report be eventually laid before Parliament full information will, of course, be given. It will rest with the Committee to decide what method of investigation should be pursued." The answers to the questions show a certain reluctance on the part of Ministers to associate themselves with this secret inquiry, and necessitate considerable research for their comprehension, but it is now apparent that this form of inquiry has Government support, and, this being the case, it assumes considerable importance. The land is too often used for vote-catching purposes, but it must be remembered that it is the bread, if not the butter, of a large section of the community. Recent open and official taxation has already embarrassed the building trade, and a depressed trade can ill survive disturbing causes. What cause can be more disturbing than a semi-official and secret inquiry into the rating and taxation of land? It must hamper any future enterprise or speculation. Only one deduction can be drawn from its secret character, and that is that, whilst the Government do not wish to take responsibility for a further policy affecting the land, they are anxious to see what can be made of it *sub rosa*. Whatever Government be in power, we should deprecate any such subterranean and secret inquiries, which are far more damaging than an open and avowed policy.

THE INSURANCE ACT.

WHILST assurances are constantly being given by those who are responsible for the Insurance Act that the Act is daily becoming better understood and its working more assured, it is important to draw attention to one point which each month only assumes greater complication. We refer to the difficulty of ascertaining what workmen are within Part II. of the Act and in respect of whom contributions are payable for unemployment insurance. The decisions of the Umpire are only published when they raise a new principle or a question of general interest, yet the applications now number 1,120, and the decisions are very numerous, and we find it quite impossible to derive any general principles from them. We have referred to this question before, and have shown that this uncertainty in the classes who have to be insured arises from the provision in the Act which has made not the business

the employer carries on the test, but the nature of the work which any workman is engaged upon (see sect. 107, subsect. 2).

The sixth schedule of the Act, which contains a list of insured trades for the purposes of Part II. of the Act, when it was framed and Parliament was assured it represented a limited experiment, was no doubt accepted in its literal meaning, but taken in conjunction with the above subsection the scope of the Act has been vastly extended, and Solomon himself might have been puzzled to determine whether or not a man came within its provisions.

The decisions delivered by the Umpire have to be mastered and collated by employers, who are placed under liability to penalties if they fail to insure a workman who is brought within the ambit of this part of the Act, and we can discern no leading principle.

Why, for instance, should "men described as bell-hangers and engaged wholly or mainly in hanging bells in buildings" be within the Act? The definition of "building" is "the construction, alteration, repair, decoration, or demolition of buildings, including the manufacture of any fittings of wood of a kind commonly made in builders' workshops or yards."

Again, why are "smiths, rivetters, and carpenters engaged in making frames for hanging bells and in making pulleys and bell-wheels" within the Act, but the workmen engaged in making the wrought-iron clappers for the bells, according to the decisions, not

included either under the heading "mechanical engineering" or "iron-founding"? A hanging a bell in a building is insurance against unemployment, a man erecting organ in the same building is not. Numerous examples could be given of the uncertainty prevailing as regards who are who are not insured persons, and it would appear to be absolutely essential that steps should immediately be taken to amend the Act so that employers may know from the Umpire—what classes of work are insurable under this part of the Act, which, it must be remembered, was introduced as an experiment to be tentatively applied to certain employments, especially subject to fluctuations in furnishing employment. If the decisions be studied, it will be seen that this latter consideration does apply to half the classes of workmen have been held to be within this part of Act.

CONSTRUCTION TOWER FOR DEPOSITING CONCRETE.

We illustrate on this page an unusual form of construction tower employed for depositing concrete at the Englewood roundhouse at Lake Shore and Michigan Southern Railway at Chicago. The main difficulty encountered by the contractors in the execution of works was due to the fact that the concrete employed had to be deposited over a large area, the roundhouse being 405 ft. in diameter. Moreover, the pit walls were

Construction Tower for Depositing Concrete.

that the distribution of concrete by barrows would have been impracticable, the cost of a series of timber construction was found to be prohibitive, the estimated cost of three such towers being £4400.

The suggestion of the Chain Belt Company of Milwaukee, a steel tower was made, the total cost of which erected in London, was less than 2000. Considerable difficulty had to be exercised in the design of the appliance in order to make it portable to provide for the deposition of concrete at every required point within the radius of delivery spout. This spout is 60 ft. in length, and being provided with an additional spiral pipe 30 ft. long, enabled the concrete to deposit concrete at a maximum distance of 95 ft. away from the base of the

tower is 72 ft. high, being made up of sections composed of steel angle and helical bars. The tower rests on timber with steel liners, which are placed on railway rails. The concrete spout is made of galvanised-iron. It measures 10 in. in diameter, and is open at the top being stiffened with light steel truss, as shown in the photograph. The truss and spout are suspended from a 40-ft. boom, which is rigged from the side of the tower and held in place by steel cables and a cable running to a winch, the cable being secured to one side of the tower at the boom and spout may be raised or lowered or swung in a semicircle, giving a range of work and permitting the spout to be placed anywhere within a radius of 95 ft. The concrete is prepared in a mixer situated about 600 ft. away from the tower, this arrangement having been due to the situation of the storage bins for raw materials. The concrete mixer discharges into a hopper, which is transported to the concrete tower, where the concrete is transferred to an elevator, hoisted to the top of the tower, and automatically delivered into receiving hopper. This hopper has a valve, which is operated by a man standing on a platform at the top, where the concrete is delivered through the spout is situated.

After the concrete has been placed on one of the works the tower is drawn back by the rails by means of the hoisting cable situated midway between the tower and the concrete mixing plant, and it is found that the tower can be moved a distance of 10 ft. in about four hours' time. Twelve men are employed in operating the machine, including those engaged in loading raw materials into the mixer, the necessary mechanics, and the men engaged in spreading concrete.

BUILDING PLANS AND BUILDING PROSPECTS.

A return of building plans submitted for approval in the third quarter of the year compared with the same quarter last year shows that there is an increase of 58,800, or 7 per cent. This increase takes place in connexion with workshops, factories, and other business premises, and is due to Lancashire, Cheshire, the Midlands, and Wales and Monmouthshire. Outer London shows a decrease of 56,071, or 10 per cent., and in dwelling-houses the same in all districts is 97,673, or 7.2 per cent.

In considering the increase shown, as published in the *Board of Trade Labour Statistics*, we find that the number of Councils returning varies slightly. Thus 102 districts are included this quarter, but last year the same quarter 101 districts made returns. It would therefore be interesting to know how the figures are corrected for comparison. If additional districts are included, would it itself disturb the averages. An adjustment, however, appears to be made for the figures now published in the return for the third quarter of 1911 to agree with the figures published in the return for October, 1911, for that quarter.

BURNHAM HOTEL, PERTSHIRE.

A building, which was destroyed by fire in 1908, is to be re-erected on as much the same site as the former building as possible. Plans are being prepared by Messrs. J. & MacLennan, architects, of Edinburgh. It is proposed to restore the fine baronial style with its open timber roof.

THE LONDON ASSOCIATION OF MASTER DECORATORS.

A QUARTERLY general meeting of this Association was held at the Holborn Restaurant on October 14, Mr. J. Anderson, President, in the chair.

Painters' Cards of Employment.

The Chairman said the Committee considered it was a great mistake that painters should apply for employment without any means of proving their qualifications, and they had considered the question and more or less approved of cards of employment which painters could carry, showing at least that they had worked for a firm for a certain time. There was nothing on the card to show the character of the man. It was, however, considered that the Insurance Act would more or less take the place of the cards, but then it was discovered that an insurance card was not quite suitable, as nothing was allowed to be put upon it except the date. The Committee had reconsidered the question, and, having regard to the fact that owing to the multiplicity of insurance cards, masters had quite enough cards to deal with for the present, the Committee recommended that the matter be postponed for the time being. This was agreed to.

Foreman Painters.

The meeting then proceeded to the consideration of suggestions as to conditions of foremen painters' employment, rate of pay, etc.

The Chairman explained that it was felt by some master decorators that there were various methods amongst firms of dealing with foremen. The matter was brought before the Committee by Mr. Campbell and discussed, and was referred to Mr. Campbell and Mr. de Jongh to go into the matter and bring up a definite Report embodying suggestions. Unfortunately, the Report had not yet matured sufficiently to bring it forward that evening, and the Committee therefore suggested that the matter be referred to the next General Committee meeting. Whatever scheme was finally adopted, it was not, of course, intended that the members should be obliged to adopt it if it did not meet with their approval. The matter was referred to the General Committee to consider the subject and report to the next general meeting.

Additional Vice-President.

It was agreed that the Association should have two Vice-Presidents and Mr. Wilkinson was unanimously elected.

Future Meetings.

The President, in giving as a delegate his Report on the Chester Convention of Association of Master House Painters, said the work sent in by the students and apprentices for competition was a distinct improvement on previous years.

Mr. Wilkinson, who also attended as a delegate, confirmed the President as to the value of the papers read and the discussions which followed.

The President explained that the meeting next year was to be held at Leamington, but there would be no exhibition there, possibly owing to lack of accommodation. In the following year the Convention was to be held in Manchester, and he had every reason to believe that three years hence the Convention would like to come to London if it could be by any means arranged. He asked the members of the Association to consider what could be done to hold the Convention in London, as he believed it would be very successful, but it meant a deal of hard work.

BUILDING OPERATIONS AT CO-PARTNERSHIP ESTATES.

On Saturday, October 19, a conference of managers, foremen, and others concerned in the building operations at various co-partnership estates at Liverpool, Stoke-on-Trent, Hampstead, and elsewhere, was held in the Institute of the Brompton Garden Suburb of the Ealing Tenants, Ltd. Mr. Henry Vivian presided, and Mr. G. L. Sutcliffe, F.R.I.B.A., opened a discussion on prime costing. The necessity of care in allocating to each part of a particular job the exact material used was urged as one of the means to avoid the great variations that

occur in the ordinary tendering by building firms. During the afternoon many of the visitors inspected the flats that are being erected for elderly folks on the Ealing Suburb, and a vote of thanks to the directors of the Ealing Tenants, Ltd., was carried on the motion of Mr. F. Litchfield, of the Garden Suburb Builders, Ltd., seconded by Mr. W. Grant, of Woodworkers, Ltd., the newly-established joinery manufacturers in the Garden City at Letchworth.

LONDON MASTER BUILDERS' ASSOCIATION.

THE Council of the London Master Builders' Association met on October 17, the chair being occupied by Mr. James S. Holliday, President.

The Special Committee appointed to confer with the representatives of the various trade organisations submitted its Reports of the several conferences which had been held, which were unanimously adopted.

Reports of the Conciliation Board meetings were received.

Correspondence relating to trade matters was read.

Messrs. T. W. Helsdon & Sons, Lisson Grove, N.W., were elected ordinary members, and the nomination of Mr. H. C. Horswill, Forest Gate, E., as ordinary member was accepted.

GOVERNMENT CONTRACTS.

THE following tenders have been accepted during the past month by the Government Departments named:—*Admiralty, Works Department*: Works services: Addition to Officer Patients' Block, Haslar Hospital—Mr. J. Hunt, Cleveland-road, Gosport; double aeroplane shed, Bachelors Messrs. Humphreys, Ltd., Knightsbridge, S.W.; foundations and works in connexion with storage accommodation for oil fuel on the Humber—Messrs. Price, Wills, & Reeves, 28, Victoria-street, S.W.; new gates for No. 2 Dock, H.M. Dockyard, Portsmouth—Receiver and Manager for Thames Ironworks, Shipbuilding, and Engineering Company, Ltd., Canning Town, E.; shop for repairing turbines and boiler shop adjoining H.M. Dockyard, Devonport—Messrs. J. Lyaght, Ltd., St. Vincent's Ironworks, Bristol. *War Office*: Portland cement (running contract)—Associated Portland Cement Manufacturers (1900), Ltd., Northfleet, Kent; Works services: alterations and additions to married quarters, Stanhope Lines, Aldershot—Messrs. G. Kemp & Co., Elms-road, Aldershot; alterations to Isolation Hospital, South Aldershot—Mr. E. C. Hughes, Albion Works, Wokingham; construction of road from Brookhead to Oxney Camping Ground, Bordon—Messrs. Turner & Kersley, Blackwater, Hants; conversion of chapel school to regimental institute, Sheffield—Mr. A. Robinson, Woodbine Works, Idle, Bradford; conversion of recreation-room, etc., to regimental institute, Hillesley—Messrs. Wigginton & Sons, Portsmouth; erection of annexes to married soldiers' quarters, Devizes—Messrs. W. E. Chivers & Sons, 28, Sheep-street, Devizes; erection of barrack expense store, Weymouth—Messrs. Jesty & Baker, Castletown, Portland; erection of electric power station, Tidworth—Messrs. W. P. Goose & Sons, 124, Milton-road, Gravesend; erection of married soldiers' quarters, Milldam Barracks, Portsmouth—Mr. F. J. Privat, Cottage-grove, Southsea; erection of stables and coachmen's quarters, Tidworth—Messrs. Wort & Way, Castle-street, Salisbury; erection of officers' quarters, Shorncliffe—Mr. T. T. Denne, Walmer, Kent; improvements to soldiers' quarters, East Kent Range, R.A. Barracks, Woolwich—Mr. W. J. Renshaw, Atlas Works, Putney; installation of heating, etc., apparatus, new barrack blocks, Fort Burgoyne, Dover—Messrs. E. Deane & Beal, Ltd., 3, Monument-street, E.C.; installation of heating apparatus, regimental institute, Jersey—Messrs. H. J. Cash & Co., Ltd., Caxton House, S.W.; maintenance and repair of War Department buildings at North Dublin—Messrs. J. & R. Thompson, Ltd., Philippsburgh avenue, Fairview, Dublin; South Dublin—Messrs. McRoberts & Armstrong, Lower Windsor, Belfast; Galway—Mr. R. MacDonald, 17, Dominick-street, Galway; Salisbury Plain (West)—Messrs. E. & A. Springings, Stamshaw, Portsmouth; overhead conductors and supports for electric light installation, Tidworth and Bulford—Messrs. G. E. Taylor & Co., 8, Bush-lane, Cannon-street, E.C.; periodical works services at Brighton and Newhaven—Messrs. Skevington Brothers, Bateman-street, Derby; Bristol,

Carragh Camp, Plymouth, and Devonport—Messrs. A. Bagnall & Sons, Ltd., Shipley, Yorks; Shorndcliffe and Weedon—Mr. T. Carr, 55, New Crown-street, Halifax; provision of increased accommodation, Bury—Mr. R. Holt, 50, Badger-street, Bury; rearrangement of drainage, Royal Army Clothing Department, Pimlico, S.W.—Messrs. W. F. Blay, Ltd., Spital-street, Dartford; reconstruction and repair of roads, Pirbright—Messrs. Turner & Kersley, Blackwater, Hants; remodelling and repair of parades, Woolwich—Messrs. Bristowe & Co., 11, Tothill-street, S.W.; removal of aeroplane sheds from Larkhill and re-erection at South Farborough—Mr. W. Harbrow, South Bermondsey Station, S.E. *India Office, Store Department*: Cement—Associated Portland Cement Manufacturers, Lloyds-avenue, E.C. *Crown Agents for the Colonies*: Bridgewater—Messrs. Head, Wrightson, & Co., Ltd., 5, Victoria-street, S.W.; road bridge—Messrs. J. Westwood & Co., Ltd., Napier-yard, Millwall, E.; steel bridgework—Messrs. J. Butler & Co., Victoria Ironworks, Halifax; cement—Messrs. Wouldham Cement Company, Ltd., 55, Great St. Helena, E.C. *Office of Works*: Building work: adaptation of Croydon Labour Exchange—Messrs. Grebb & Son, 75, Streatham-hill, S.W.; erection of the Hyde Sorting Office, Hendon—Mr. W. Tout, Brent-street, Hendon, N.W.; superstructure of extension of new public offices, Westminster, S.W.—Messrs. Holloway Brothers (London), Ltd., Belvedere-road, Lambeth, S.E.; alterations to Nottingham County Court—Mr. G. A. Pillatt, 52, Sherwood-street, Nottingham; foundations of new offices for Public Trustee—Messrs. T. H. Kingler & Sons, Oxford; adaptation of Stratford Labour Exchange—Mr. A. G. Barton, Deventry Works, Walthamstow, N.E.; erection of head post-office, Weybridge—Mr. F. J. Privett, Haslemere, Surrey; erection of sub-post-office, Whittington Barracks, Lichfield—Messrs. T. Lowe & Sons, Burton-on-Trent; drainage work: readjusting of Buckingham Palace—Messrs. Matthews, Hall, & Co., 88, Wigmore-street, W.; remodelling lavatories, Edinburgh General Registry House—Messrs. G. & R. Cousin, 14, Waverley-market, Edinburgh; readjusting of St. James' Palace—Messrs. Davis, Bennett, & Co., 94, Horseferry-road, Westminster, S.W.; reglazing roofs of Victoria and Albert Museum—Messrs. Higgs & Hill, Ltd., Crown Works, South Lambeth-road, S.E.; heating apparatus, Scala Legation—Messrs. Davis, Bennett, & Co., 94, Horseferry-road, Westminster, S.W.; steel sashes, new Stationery Office—Messrs. Critall Manufacturing Company, Ltd., Manor Works, Baintree; ventilation work at Custom House, E.C.—Messrs. J. Stett & Co., 158, Queen Victoria-street, E.C.; woodpaving, Admiralty Arch—the Improved Wood Pavement Company, 46, Queen Victoria-street, E.C. *General Post Office*: Laying lines of pipes in Great Dover-street, S.E., and Lee High-road, Burnt Ash-hill, S.E.—Messrs. William Griffiths & Co., Ltd., Hamilton House, Bishopsgate, E.C.; laying lines of pipes at Springfield, Glasgow—Messrs. Airds, Ltd., 22, Queen Anne's-gate, S.W.; also Messrs. Bingley, Son, & Folitt, Ltd., Westminster, S.W. *Commissioners of Woods*: Alterations at Beaufort Arms, Tintern—Mr. G. Jones, Monmouth.

ORGANISATION OF BUILDERS' WORKMEN.

A CONFERENCE was held on the 21st inst. at Essex Hall to consider the results of the ballot recently taken by twenty workers' unions in the building trade on the question of amalgamation.

At the end of the Conference, which was private, Mr. Bowerman, M.P., the Secretary, stated, says the *Times*, that the figures showed a large majority in favour of the principle of amalgamation. A further meeting of the consenting unions is to be held to draw up a full scheme of amalgamation. The unions which have decided to join the movement are the Amalgamated Carpenters and Joiners, Manchester Bricklayers, Plumbers, Stonemasons, National Union of Builders' Labourers, United Builders' Labourers, National Union of Bricklayers, Stonemasons, and Paviors, and the London and Provincial Society of Painters and Decorators.

BENTLEY SEWAGE.

The Bentley Urban District Council have accepted a tender, by Messrs. Arnold & Son, of Doncaster, for the construction of new sewerage and sewage disposal works. The price is 12,458*l.*, and includes the making of new works on the Tollbar Estate, enlargement of the present works in Arksey-lane, and the installation of new pumps at Bentley-road.

GENERAL BUILDING NEWS.

COUNCIL SCHOOL, HELWITZ BRIDGE.

This new school at Helwitz Bridge, near Settle, has been erected at a cost of 682*l.* from the designs of Mr. John Stuart, Architect to the West Riding County Council. The school provides accommodation for about sixty pupils and was opened on the 12th inst.

SECONDARY SCHOOL, WHITLEY BAY.

The new County Council Secondary School, Whitley Bay, is being erected from plans prepared by Mr. G. T. Forrest, and it is hoped it will be ready for occupation in about sixteen months' time.

HOSPITAL, BENFELDSIDE.

The foundation-stone of the Murray Commemoration Hospital was laid at Benfelside on the 16th inst. The site of the hospital is in Risdon-road, Benfelside. The building will consist of four separate blocks, connected by an enclosed corridor 6 ft. wide. The ward pavilion or nursing block is two stories high, the ground floor being for males, and the upper floor set apart for females and children. The place is designed so as to be a convalescent home as well as a hospital. The premises have been arranged so as to allow of future extensions, and a new north ward may be added to the pavilion without disturbing the ordinary routine of the institution. The buildings have been designed by Mr. J. J. Eltringham, of Blackhill, and the principal contractor is Mr. J. L. Miller, of North Shields. The heating arrangements have been entrusted to Mr. William Richardson, of Darlington. The total cost of the hospital is 13,500*l.* The buildings will be of brick, with stone facings.

BUSINESS PREMISES, SOUTH SHIELDS.

Messrs. Fowler & Brock, of King-street, South Shields, have recently carried out extensions to their premises at a cost of about 3,500*l.* The scheme necessitated the remodeling and improvement of the internal arrangements of the existing premises, and the rebuilding of two blocks of property. The new premises have been carried out to harmonise with the adjoining building, being faced with Heworth Burn Stone, and Messrs. Sage & Co., London, have designed and carried out the shop fronts, which are of polished mahogany, with base of polished granite, and mountings and fittings of bronze. A feature of the work is the large island window and the two entrances at each side, the effect being to provide an arcade, with marble mosaic pavement. Internally, access to the upper floors is obtained by three staircases. The heating is by low-pressure hot-water system, with numerous radiators, this work having been done by Mr. George Gray, of South Shields, and the building is lighted by electricity. The general contractors for the work was Mr. James Carruthers, and the architect was Mr. Henry Grieves, A.R.I.B.A., both of South Shields.

TRADE NEWS.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air-inlets, has been applied to Cairn Ryan School, Wigtownshire.

The Festiniog Urban District Council Assembly Rooms are being ventilated by means of Shorland's patent exhaust roof ventilators and patent hygienic inlet ventilating panels, supplied by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

LONDON COUNTY COUNCIL SCHOLARSHIPS.

Application forms for Trade Scholarships must be submitted to the Education Office, Education Offices, Victoria-embankment, W.C., not later than Saturday, October 26. Successful candidates will be required to take up their awards immediately after Easter, 1913. By means of these scholarships boys may secure free education (with maintenance grant) at trade schools, at which they will receive such instruction as will prepare them on leaving school to take up either apprenticeships or employment in skilled trades. No candidate is eligible whose parents (or guardians) do not reside within the area of the administrative County of London. The scholarships are only intended for boys who intend to enter at the end of the course the trades in which they receive training. The London County Council is being recommended to award ten scholarships in painting and decorating at the London County Council School of Building, fifteen scholarships in building at the Northern Polytechnic, and ten scholarships in engineering at the London County Council Hackney Institute, and to transfer the ten existing scholarships in building at the London County Council Hackney Institute to the Northern Polytechnic.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with. The names of the applicants are given in parentheses:—

Lines of Frontage and Projections.

Bethnal Green, North-east.—Erection of iron and glass shelter in front of a building on the southern side of Hackney-road, abutting upon the eastern side of St. Peter's-street (Messrs. F. Matcham & Co. for Messrs. Hyman).—Refused.

Width of Way and Line of Frontage.

Islington, North.—Re-erection of No. 2, Hornsey-road, Islington (Mr. A. S. R. Ley).—Consent.

Width of Way and Construction.

Limehouse.—Erection of sheds of a temporary character at No. 2, Church-row, Limehouse, next to Maize-row (Mr. A. Hall).—Refused.

Lines of Frontage and Construction.

Battersea.—Erection of a wood and iron motor shed at the side of No. 38, Spencer-road, next to North-side, Wandsworth-comm (Mr. T. Wilson).—Refused.

Brixton.—Temporary octagonal building No. 437, Brixton-road, Brixton (Mr. R. L. Sims).—Consent.

Dulwich.—Temporary greenhouse and jutting shed at the rear of No. 29, Allyn-pa Dulwich, abutting upon Allyn-road (Mr. A. Hertz).—Consent.

Islington, East.—Erection of an addition front of Globe Works, Queensland-road, H. way (Messrs. W. Barnes & Son).—Refused.

Norwood.—Temporary iron building on western side of Tulse-hill, Brixton (Mr. Hill).—Refused.

Space at Rear.

Chelsea.—Erection of additions at the rear of No. 52, Draycott-place, Chelsea (Messrs. Ruscoe Brothers & Co. for Captain F. Grogan).—Consent.

Chelsea.—Erection of Sloane Gate-mansion on the eastern side of D'Oyley-street, Chelsea (Messrs. W. & E. Hunt).—Consent.

Kensington, South.—Addition at the rear No. 125, Earl's Court-road, Kensington (Mr. W. Knight).—Consent.

St. George, Hanover-square.—Erection of additional story at No. 67, Curzon-street, M. fair (Messrs. Marion & Co., Ltd.).—Consent.

Westminster.—Erection of a building at north-eastern corner of Smith-square, Westminster (Messrs. W. Cobby & Co. and Messrs. H. Field & Simmons).—Consent.

Heights of Buildings.

Westminster.—Erection of the New Midsex Guildhall exceeding in height the width of the street leading from the Sanctuary to Little George-street, Westminster (Messrs. G. Skirwith & Gordon for the Middlesex County Council).—Consent.

Construction.

City of London.—Water-tanks on the roof of a building upon the site of Nos. 22 to Farringdon-street, City (Mr. H. O. Ellis).—Consent.

Alteration of Buildings.

Kensington, North.—Additions at the rear No. 53, St. Ervan's-road, Kensington (Mr. Hunt).—Consent.

Paddington, South.—Alterations at No. Westbourne-grove, Paddington (Messrs. Whiteley, Ltd.).—Consent.

George, Hanover-square.—Erection of a wing on the northern side of Hanover-square, Westminster, abutting upon the eastern of Harwood-place (Messrs. Colclutt & Co.).—Consent.

Cubical Extent.
London, South.—Erection of a goods lift for Messrs. Stephens for Harrod's Stores, &c.—Consent.

Uniting of Buildings.
London.—Formation of openings at the end of first-floor levels between Nos. 40 and 52, Robart-street, Brixton (Messrs. H. G. & Sons, Ltd., for the trustees of the Mr. W. Slade).—Consent.

Uniting of Buildings.—Formation of a further wing in the party wall at the ground-floor between Nos. 41, Lethbury and 38, Throgmorton-street, City (Mr. A. Blomfield).—Consent.

Thames.—Doors of special construction in of iron doors to an opening at Thompson's Laundry, Margrave-road, Hamnith (Fireproof Doors, Ltd.).—Consent.

Thames.—Openings in the party wall between Nos. 225 and 224, and Nos. 223 and 225, Thames Court-road (Mr. A. H. Heron for National Cash Register Company, Ltd.).—Consent.

Thames.—Uniting of Nos. 15 and 16, and travillie-place, St. Marylebone (Messrs. Kennedy, & Co., Ltd.).—Consent.

George.—Omission of double iron doors between Nos. 14 and 16, High-street, Wapping (Mr. M. Marsland for the London and Edinburgh Shipping Company).—Consent.

London.—Uniting of Nos. 15, 16, and 17, High-street, Long-acre (Mr. W. Petch).—Consent.

London.—Uniting of No. 50, Shaftesbury-road, with No. 20, Rupert-street (Mr. T. B. May for the London City and Midland Railway).—Consent.

Recommendations marked + are contrary to the views of the Metropolitan Borough Councils concerned.

BUILDING BY-LAWS.

Wednesday's Parliamentary Papers Sir H. Boscawen asked the President of the Local Government Board whether he could give any response he has had, if any, to the circular issued last month to District Councils regarding building by-laws; whether District Councils were taking steps to amend their by-laws; and whether he possessed powers to compel local authorities to amend their by-laws in cases where they were found to be in conflict with the provisions of the Metropolitan Building By-laws Act, 1909.

Burns replied that he had not yet received any response to the circular, but that a large number of local authorities had made application for copies of the by-laws, and that he was not doubt considering the question of adopting by-laws suitable to their district. He referred the Hon. Member to the Housing and Town Planning Act, 1909.

REJECTED NEW BUILDINGS IN THE PROVINCES.*

Exeter.—Hospital (100,000L.). Messrs. E. Kelley & Brothers, builders, 130, Rice-street, Exeter.

London.—Forty-nine houses for the Ashford Coal Company, Ltd., Milburn House, Ashford-on-Tyne.

London.—Garages, Marlborough-place, for Mr. E. Evans & Son, carriage builders, Carlisle-street, Banbury.

London.—Proposals for conveniences and baths for Messrs. J. P. Reynolds, architect, Waterloo-street; Surveyor, Council Offices, Bangor.

London.—Workshops at Nelson Foundry, Waterloo-street; Messrs. G. Moxon & Son, 11, chambers, 26, Church-street, Barnsley. Work in Furness.—Extension to tramway for the British Electric Traction Company, Ltd.

London.—Offices and additions at Turkey Works for Messrs. Kearns, Allen, & Co., iron merchants.

London.—Picture theatre, King's Heath (No. 1); Mr. P. Reynolds, architect, Waterloo-street; Surveyor, Council Offices, Bangor.

Bedworth.—Baptist church, Coventry-road (2,500L.). Mr. T. R. J. Meakin, architect, Warwick-street, Coventry; Mr. L. Bunney, builder, Bedworth.

Bishop's Itchington.—Houses for Messrs. Greaves, Bull, & Lakin, cement manufacturers, Harbury, Leamington Spa.

Bishop's Itchington.—Swimming-baths, South Mill (about 1,000L.). Mr. R. S. Scott, Surveyor, Council Offices, Bishop's Itchington.

Blackpool.—School; Rev. J. Bradbury, Pastor, Chapel-street, Primitive Methodist Church.

Bradford.— Wesleyan Sunday-school, Undercliffe (2,400L.), for the Trustees.

Brighton.—Drill hall, etc.; Captain Hawker, North-street, Quadrant, Brighton.

Bury.—Nurses' home (745L.); Mr. J. Isherwood, Clerk, Guardians' Offices, Bury.

Christon.—Four houses at epileptic colony, East Muckcroft, for the Glasgow Parish Council.

Crick.—School; Mr. J. L. Holland, County Education Offices, Northampton.

Daventry.—School (2,946L.); Messrs. Adams & Son, builders, Oxford-street, Daventry.

Doncaster.—Offices; Mr. R. Waterhouse, architect, Staple Inn-buildings, Holborn, W.C.

Dublin.—Housing scheme; Mr. C. J. McCarthy, Architect, City Hall, Dublin.

Dundee.—Extensions to Stobswell Works, Dundee-street, for the Bult Spinning Company, Ltd.; alterations to premises, Perth-road, for Messrs. A. & R. Lickley.

Edinburgh.—Conversion of 44-48, Nicholson-street, into picture palace (750 places) for Mr. Ralph Pringle.

Llanelli.—One hundred and twenty-four houses; Mr. George Watkeys, Surveyor, Council Offices, Llanelli.

Llanwrin.—School; Mr. G. A. Hutchings, County Architect, Welshpool.

Newtown.—School; Mr. H. C. Marks, Surveyor, Town Hall, Carlisle.

Ormskirk.—Battery and sub-station (about 3,000L.); Messrs. J. Robinson & Son, builders, Ormskirk.

Orrell.—Holgate Congregational Church; Messrs. J. B. & W. Thornley, College-chamber, Library-street, Wigan.

Oswaldtwistle.—Proposed library; Mr. R. N. Hunter, Surveyor, Council Offices, Oswaldtwistle.

Paisley.—Additions and alterations to works, Gordon-street, for Messrs. James Paton, Ltd., wholesale stationers, 110, Causewayside-street, Paisley.

Penrith.—School; Mr. C. C. Hodgson, County Education Offices, Carlisle.

Plymouth.—School (14,000L.); Mr. J. H. Ellis, Clerk, Town Hall, Plymouth; architect to be appointed by competition.

Polesworth.—School; Mr. A. S. Dixon, architect, Broad-street, Birmingham.

Raunds.—School; Messrs. Blackwell & Ridley, architects, High-street, Kettering.

Redruth.—Additions to workhouse (672L.); Mr. T. C. Peter, Clerk, Guardians' Offices, Redruth.

Scarborough.—Bungalows, shelters, and improvements in North Bay and south side of promenade (5,580L.); Mr. Henry W. Smith, Engineer, Town Hall, Scarborough.

Selly.—Roman Catholic School; Very Rev. Canon Worthy, St. Mary's, Selly.

Sheffield.—Improvements to the Jessop Hospital for the Board of Management. Plans have been passed as follows:—Six houses, Chesterfield-road, for Miss A. Hunt; additions to premises, Montfort and Lopham streets, for Messrs. W. Stones, Ltd.; additions to premises, Archer-road, for Messrs. W. S. Laycock, Ltd.; alterations to premises, Cambridge-street and Backfields, for the proprietors of the Sheffield Hippodrome; additions to premises, Penistone-road, for Messrs. D. Doncaster & Sons, Ltd.; additions to premises, Watson's-walk, for Messrs. T. B. & W. Cockayne, Ltd.; seventeen houses, Greenhill and Harbord roads, for Mr. J. Levor; additions and alterations to Matilda Tavern, Matilda-street, for Messrs. S. H. Ward & Co., Ltd.

Skibbereen.—Seventeen houses (154L. each); Mr. William Casey, builder, North-street, Skibbereen.

South Elmsall.—Forty-four houses off Broad-lane for the Carlton Main Colliery Company, Barnsley.

Sparkbrook.—Tramway depot (21,747L.); Mr. T. Johnson, builder, Willis-street, Birmingham.

Stafford.—Engineering Institute; Mr. K. L. Hutchings, Education Offices, Stafford.

Stratford-on-Avon.—Meter house, etc.; Messrs. G. Whately & Sons, 27, Rother-street, Stratford.

Sunderland.—St. John's Church Institute; Messrs. Caws, Steel, & Caws, architects, 22, Fawcett-street, Sunderland.

Tanfield.—Offices, Tanfield Lea, for Messrs. J. Joicey & Co., Ltd., colliery owners, Cathedral-buildings, Dean-street, Newcastle.

Uppingham.—Extensions to bank for Messrs. Barclay & Co., Ltd., bankers, 54, Lombard-street, E.C.

Walsall.—The following plans have been passed:—Electric theatre, Stafford-street and Green-lane, for Mr. T. Jackson; additions to laundry, Lower Rushall-street, for Messrs. T. Gamson & Sons, Ltd.; warehouse, Green-lane, Leamore, for the Talbot-Stead Tube Company, Ltd.; additions to offices, Sawmills, Bloxwich, for Messrs. E. W. Turner & Co.; rebuilding garage, Green-lane, for Messrs. J. Birch & Sons; alterations and additions to Temperance Hall, Freer-street, for the Trustees.

Warrington.—Proposed alterations to police buildings; Mr. T. Longdin, Surveyor, Town Hall, Warrington.

West Sussex.—Three schools; Mr. H. R. Roberts, Architect, Education Offices, Horsham.

Worcester.—Proposed swimming-baths; Mr. A. G. Parker, Architect, Town Hall, Worcester.

FOREIGN AND COLONIAL.

Industrial Awakening of Turkey.

The following information is from the Report by Mr. B. A. Altintop, of the British Consulate-General at Smyrna, on the trade of that district in 1911-12, which will shortly be issued. Quite a number of mills and factories have been erected in the Smyrna district during the last few years. The most important of these are for spinning and weaving (cotton and wool), and for extracting oil from cotton seed and tannin from valonia. The industrial awakening is further evidenced by the establishment of a large number of machine workshops, by the steadily increased imports of machinery, and the gradual substitution of mechanics appliances for hand labour. A new brewery is in course of construction in Smyrna, and the staple industry of the district (carpet manufacturing) is visibly extending. Dissatisfaction with the present, and uncertainty as to the future, extreme caution and reserve in all dealings, tightness of money, restricted credit, and scarcity of labour, may be said to be the characteristic features of the present situation. The great hopes raised as to the country's economic and other developments a few years ago have not been realised. No steps have been taken to develop the agricultural and mineral resources of the country, and no appreciable improvement has been made in municipal administration or public security. Signs of improving conditions, however, are visible. Great activity is noticeable in the building trade of Smyrna. The town has been undergoing a veritable transformation during the last three or four years. Substantial bank buildings, business premises and warehouses, theatres, factories, educational establishments, and private houses, both in the town and suburbs, have been built, and others are now under construction. The increase in the importation of building material, such as cement, timber, tiles, iron, sanitary appliances, etc., is an additional evidence of activity in this respect.

VACUUM CLEANER INSTALLATIONS.

The hygienic system of removing dust from carpets, furniture, and the interior of buildings generally practically dates from the year 1900, when the British Vacuum Cleaner Company introduced apparatus constructed under the Booth patents. The success achieved by these appliances has naturally brought about the evolution of various rival devices devoted to the same end.

In discussing the subject our aim is merely to summarise for the convenience of readers the general types of vacuum cleaner apparatus available in the present day without making any comparisons of invidious nature.

Vacuum cleaners of the mechanical type, from the handy little machine which can be carried about a private house to the elaborate plant for installation in large public and other buildings, may be divided into two classes:—(1) Machines where suction is established by means of bellows, and (2) machines where rotary or piston pumps are employed for creating the requisite vacuum.

A third class of vacuum cleaner is represented by apparatus of the ejector type, where the working vacuum is produced by a current of water, steam, or compressed air, the fundamental principle involved being analogous to that underlying the design of the injector largely employed for boiler-feeding purposes.

While portable machines of the bellows and pump types, made suitably for being carried or wheeled about a building, are extremely useful and convenient, whether operated by hand or by electricity derived from existing light or power circuits, there is no doubt that for large public, mercantile, and industrial buildings the most satisfactory form of machine is one laid down as part of a complete installation, including a system of suction mains connecting the vacuum plant with all parts of the building, and having wall fittings at various points for the attachment of hose pipes, each terminated by the mouthpiece by which dust is sucked up and conveyed to the collector forming part of the mechanical plant.

Fig. 1 illustrates a compact cleaner set capable of maintaining the necessary working vacuum for the effective simultaneous operation of two cleaning implements. The apparatus comprises a 2-h.p. electric motor, with switch, rheostat, and cut-outs, a rotary pump driven by belt from the motor, and a dust-collector connected with the pump by flexible hose. The collector is provided with internal baffler filtering medium, and the requisite fittings and mountings. The main suction pipe is connected to the collector, from which dust is removed for disposal at such intervals as may be necessary. The set illustrated measures 6 ft. 6 in. long by 2 ft. wide by 3 ft. 6 in. high; these overall dimensions also applying to a form of the set where a petrol motor is provided in place of the electric motor shown.

Larger sets of the stationary type, with 5-h.p. electric or petrol motor, are usually supplied with the essential units arranged so as to be fixed independently, the floor space occupied being about 3 ft. 6 in. wide by from 8 ft. 6 in. to 12 ft. or more according to circumstances. Cleaner sets of this type are supplied with either rotary or piston pump, as may be preferred.

Apparatus of the types described above have been widely used with uniformly satisfactory

results in the Houses of Parliament, the Royal Courts of Justice, the British Museum, the King Edward VII. Sanatorium, various Government offices, and numerous important buildings throughout the country.

The advocates of vacuum cleaning on the ejector principle claim that apparatus of the class now to be discussed dispenses with the use of relatively bulky motors, pumps, and dust filters, with their attendant noise, vibration, and risk of breakdown, by substituting a small and compact fitting, occupying no floor space whatever and requiring no attention of any kind.

As examples we select two types of ejector apparatus, one operated by steam and the other by water.

The first is that known in London as the Improved Vacuum Cleaner, and in Manchester as the Atlas Vacuum Cleaner. The ejector, supplied with steam from an existing or specially provided boiler, is fixed on any convenient wall, and on opening the steam-valve a large volume of air is drawn through the main suction pipe, steam and dust-laden air being conducted to a separator, where the dust is collected by centrifugal force and discharged at the bottom of the separator in the form of sludge, while the steam and air escape through an exhaust pipe at the top. The makers claim that the apparatus can be used for cleaning two rooms simultaneously, and point out that when one room has been cleaned the hose can be disconnected without interfering with the conduct of work in the other. This form of ejector plant has been installed at the Royal Automobile Club, Queen Anne's Mansions, the Carlton, Ritz, Piccadilly, and Hyde Park Hotels, and other buildings in London and the provinces.

The second ejector system is that introduced two or three years ago by Messrs. A. & P. Steven, and termed the Hydrovakum. The apparatus consists simply of a short piece of iron pipe inside which is an ejector nozzle connected with an interior perforated pipe. It is made in two types, one for low-pressure and the other for high-pressure water. The nature of a typical installation is shown in Fig. 2, where D is the ejector apparatus, W is the water supply pipe controlled by the valve V. The suction-pipe S is provided with couplings C, to which are attached flexible cleaner hose-pipes F when the apparatus is at work. Dust mixed with water is discharged through the trap T direct into the nearest drain.

This apparatus is capable of maintaining the vacuum of about 28 in., when exhausting from two lines of cleaning hose simultaneously. One great advantage it possesses is the automatic disposal of dust into the drain, and another is the entire absence of any auxiliary plant in the form of steam boilers and machinery. The makers have recently adapted their apparatus for use as a combined fire protection and vacuum cleaning system, the operation of which is as follows:—

In case of fire an electric button is pressed, with the result that the direction of water flow is reversed, and the suction

pipes are filled with water under pressure and available for discharge through the cleaner pipes, which thus act the part of a hose. The electric button is protected by thin sheet of mica to prevent it from being tampered with by playful or mischievous persons.

The Hydrovakum system of cleaning is quite suitable for buildings of large size, as may be judged by the fact that it is in use throughout the Midland Railway Hotel, Manchester, and has been adopted for installation at the premises of the Calico Printers' Association the same city.

ELECTROLYTIC DISINFECTANT.

In the annual Report for 1911 to the Metropolitan Borough of Poplar the Medical Officer Mr. F. W. Alexander, gives details of the cost of manufacturing, and the mode of using, electrolytic disinfecting fluid. This fluid, which contains magnesium hypochlorite, has already been made by the Borough for the past two years, and the Medical Officer is fully convinced that there is no more suitable means of producing a cheap, clean, and effective chlorine solution. The disinfectant continues to be added to water in the swimming-baths in the same proportion as hitherto, viz., one part of chlorine to 2 million parts of water. During the year just past 7,560 gallons of the fluid were supplied to the Poplar, Bow, and Island Baths; and addition of this fluid prevents the formation of slime in the water, and also prevents the occurrence of offensive smells when the baths are being cleaned. The average strength of the fluid made is 5 grammes of available chlorine per litre.

The total output of this hypochlorite solution during the year 1911 was 53,063 gallons, which the total cost of materials was 107l. 14s. Included therein is the principal item 56l. 16s. 7d. for 9,093 Board of Trade units of electricity at 1½d. per unit, which was generated in the Poplar Borough station, and bottled in casks, and labels, 19l. 6s. 1d. Since the installation of the plant 200,000 gallons of the fluid have been made for the sum of 380l., of which 212l. was paid for electricity, leaving 168l. for raw materials, including water used in the manufacture. Respecting the 212l. of electricity, the Report points out that advantage accrues therefrom to the Borough because 35%, equal to 16 per cent., is clear profit.

It is quite possible that a saving could be made upon the raw material, but, as the plant worked absolutely by unskilled men, a further

Fig. 1. Electrically-driven Rotary Pump Vacuum Cleaner Set.

Fig. 2. Hydrovakum Installation.

must be adopted. The labour has been considerably lessened by a small electric motor driving the fluid while making it chemically stable; and quite recently the same motor has been arranged to keep the fluid in the large supply tank constantly stirred, so as to maintain electrolyte at a constant specific gravity. The process last mentioned was formerly done by hand. The nature of the operation may be seen from the following summary of the English patent 27,463, of December 12, 1907, issued to F. W. Alexander and his coadjutors. Magnesium hydroxide, oxide, or carbonate, or preparations containing these substances, are added during the process of manufacturing stable bleaching liquors, in order to render stable hypochlorite solutions, and more especially magnesium hypochlorite solutions, stable. The solution is vigorously stirred during the process by means of an ebonite rod, or one or more flaps of pure rubber, or alternatively the liquid may be beaten or shaken, or else allowed to percolate through the magnesium compounds.

As an illustration of the degree of constancy the solution it may be mentioned that a sample which, on March 17, 1906, contained 13 grammes of available chlorine per litre, as found on October 29, 1908, still to contain 85 grammes, or nearly 80 per cent. of its original strength. According to a report by him, 1 oz. of the fluid to 150 oz. of water will kill the cholera germ in two and a half minutes, and will also kill the typhoid bacillus. Constancy of the effectiveness of chlorine disinfection is afforded by the large scale treatment water supplies to towns in many parts of the world, two of which are given below.

In November, 1910 (writes Mr. W. M. Wards, in the *Transactions of the Canadian Society of Civil Engineers*, 1911), an increase of typhoid fever occurred in the town of Athabasca, on the Saskatchewan River, which, along with the Medical Officer, investigated. The cause was a contaminated water supply, and to remedy this a permanent plant was erected to effect sterilisation of the water by chlorine.

The plant consists of a powdering and sieving tank, a rising current conical mixing-tank, three forced-concrete storage tanks, two small roller feed-pumps, and the process treats the water with commercial bleaching-powder, in amounts of 5 lb. to 15 lb. per million gallons of water. The active agents in the powder are calcium chloride and calcium hypochlorite, the latter of which has been found to oxidise organic matter proportionally to the length of the dosing solution and its extent of dilution on admixture with the raw water. The calcium compounds increase but very slightly the total hardness of the water. Besides these changes, which are hardly discernible to the present methods of analysis, there is the destruction of any pathogenic bacteria which may be present. This was proved by the diminution in the number of typhoid cases in the town after the water began to be treated in this way. The bacterial results were quite florid and satisfactory, any germs that survived the treatment having been found to be non-injurious ones.

The efficiency of chlorine treatment is also affirmed by Mr. H. Bruns, who, in the *Journal of Gasbeleuchtung*, 1912, gives particulars of operations conducted upon the Ruhr water supply. In consequence of an outbreak of typhoid fever, bleaching-powder was added in normal proportions, the daily flow of about 1,000 cubic metres of water receiving 1.5 to 0.6 grammes per cubic metre, equal to 0.5-0.6 grammes of available chlorine. The action of chlorine was not allowed to continue beyond thirty minutes, when the excess was neutralised by adding sodium thiosulphate corresponding to the weight of bleaching-powder used. The test for bacterium coli in the water after treatment usually showed their absence in 100 cubic centimetres, and thermophilic bacteria are reduced to one-fifth.

The treatment was during fifteen weeks, the typhoid epidemic rapidly abating after the inauguration; whilst the cost did not exceed 0.10 pence of a pfeiffer per cubic metre of water.

NEW OFFICES, CARDIFF.

Mr. H. Budgen, F.R.I.B.A., is the architect for the proposed new block of offices which is to be erected in Mount Stuart-square. These offices will have a clear floor space front to back of more than 100 ft.

MANCHESTER SEWAGE DISPOSAL.

In the Report of the Rivers Committee of the Manchester Corporation for the year ending March 31 last it is stated that during the year 11,667 tons of house refuse were delivered at the Withington bunkers and destroyed, in addition to 365 tons of garbage from the green, making a total of 12,032 tons of refuse destroyed. The volume of sewage delivered at the Withington works during the year was 1,673,345,100 gallons, or an average of 4,597,100 gallons per day.

The volume of sewage delivered at the Davyhulme works from March 30, 1911, to March 27, 1912, inclusive, was 12,382,950,000 gallons. A portion of this quantity, amounting to 129,227,000 gallons, was diluted beyond the five to one limit, up to which the works are designed to treat. The average daily flow of sewage was 34,019,000 gallons, that of the previous year having been 36,182,000 gallons, showing a decrease at the rate of nearly 6 per cent.

The Report states that there are definite indications that the amount of putrescent matter in the Ship Canal water is being gradually reduced. The average effluent during the year shows a higher percentage of purification of the raw sewage than has hitherto been obtained, and it is anticipated that further improvement as the beds now under construction on the Barton area are brought into operation will be effected.

METROPOLITAN WATER BOARD.

Last Friday, at the first monthly sitting of the Metropolitan Water Board after the recess, the following matters were dealt with:—

New Works in Kent.—The Law and Parliamentary Committee was instructed to prepare and submit to the Board a draft Bill to be introduced in the next session of Parliament to confer on the Board powers for (inter alia) the (i.) construction of a reservoir at Shooter's-hill of a capacity of about 1,000,000 gallons; (ii.) construction of a pumping-station at Shooter's-hill and the laying of a main from the Woolwich Common reservoir to the pumping-station, and from thence to the Shooter's-hill water-tower; (iii.) laying of a main from the existing 18-in. main in the Well Hall-road to the proposed new reservoir at Shooter's-hill; (iv.) construction of a reservoir of a capacity of 250,000 gallons on the Board's land at Betsoms-hill, and the laying of a 10-in. main from Westerham-hill pumping-station to the new reservoir and thence to Knockholt reservoir; and (v.) construction of a reservoir on the Board's land at Westerham-hill (capacity 250,000 gallons).

Other Works.—The following amongst other works were authorised to be carried out:—Laying mains at Kempton Park, 1,650 ft.; mains in Stoke Newington, 1,290 ft. and 2,350 ft.; repairing water bridge on Island Barn reservoir, 1,250 ft.; repair of houses at High Beech, 145 ft.; and repairs at Ponder's End Mill, 268 ft.

LAW REPORTS.

KING'S BENCH DIVISION, DIVISIONAL COURT.
(Before the LORD CHIEF JUSTICE, Mr. Justice CHANNELL, and Mr. Justice AVORY.)

The Building Construction Company v. Hammerstein.

On Friday, October 13, the Court heard the appeal of Mr. Oscar Hammerstein, of the Opera House, Kingsway, from a decision of an arbitrator in a case in which the Building Construction Company, Ltd., were the claimants for a sum of 20,461 ft. for work done, it was alleged, on behalf of Mr. Hammerstein in the building of his new opera house. The matter came within the scope of the Arbitration Act, 1889, and the arbitrator was Mr. Leonard Stokes, then President of the Royal Institute of British Architects.

Mr. Holman Gregory, K.C., with Mr. Beyfus, were for the appellants, and Mr. Hutchinson, K.C., was for the respondents.

Mr. Beyfus, in opening the case, said the point in the case was whether the arbitrator had jurisdiction to deal with certain claims made by the respondents, and a certain amount turned upon what was meant by the "carcase" of the building. The arbitrator had not only decided that he had jurisdiction, but at first refused to state a case. Mr. Beyfus then read the special case stated by the arbitrator, and it appeared from the agree-

ment between the parties that Mr. Hammerstein was desirous of having constructed the "carcase" of a new opera house on a site at Kingsway, and had asked Mr. Bertie Crewe, architect, of 75, Shaftesbury-avenue, W., to prepare plans and specifications. The contractors agreed to execute the work according to the specification and details included in the bills of quantities to be prepared by Mr. H. E. Pollard, of Lower James-street, Golden-square, W.C. Clause 1 of the agreement said "that in consideration of the sums paid to the contractors they would execute the work according to the drawings," etc., while one of the conditions set forth in the schedule, dealing with the extras, stipulated that the contractor could, when authorised by the architect, vary the work by way of omission or extra to the specifications, while there were other clauses dealing with payment to the contractors, which was by certain instalments at the rate of 85 per cent. of the value of work executed on the building. The case further stated that at the date of the contract no drawings or specification or bills of quantities were in existence, and the arbitrator found as a result of the evidence he heard that while the term "carcase" recited in the contract was somewhat vague and indefinite in regard to the precise matters included therein, the schedule of prices, specification, etc., related, to some extent, to matters which were not included in or covered by the term "carcase."

It appeared that at an interview on October 10, 1910, when the contract was signed, and at which Mr. Hammerstein was present, a conversation took place, the substance of which was as follows:—"As regards the execution of any works in connexion with the completion of the opera house by firms other than the contractors, with the exception of such works as electric lighting, decoration, and stage fittings, which Mr. Hammerstein wished to carry out himself, it was arranged that Mr. Crewe should select such firms as he considered most suitable for the purpose, and in order that Mr. Hammerstein should have one main contractor to deal with the contractors were to sub-contract to the firms selected, in consideration for which they were to receive 10 per cent. upon the net amount of such contracts." A large number of such contracts were afterwards entered into with the sanction of Mr. Crewe and the question was whether these sub-contracts related to matters which came under the definition of the word "carcase." The question was a difficult one, but the evidence given before him (the arbitrator) could be summarised as follows:—Some of the matters dealt with by sub-contractors were included within the meaning of the word "carcase," others were not so included, while others again were doubtful. None of the sub-contractors related to works reserved by the architect for Mr. Hammerstein, such as decoration, electric lighting, and stage fittings. As the work proceeded, payments were made on the architect's certificates, but no attempt was made to differentiate between "carcase" and other works, while many works not included in the meaning of "carcase" were contained in the certificates and many had, in fact, been paid for by Mr. Hammerstein. At the same time there was no evidence that Mr. Hammerstein ever saw any of the certificates or was aware that money paid by him included works other than carcase works. Notice of arbitration was given by Mr. Hammerstein on December 20, 1911, when he contended that he had paid the Building Construction Company a sum exceeding that due to them for the works executed, and he denied that the contractors were entitled to an immediate certificate for the payment of the sum of 10,000 ft. in respect of the work, and to the subsequent payment of other sums. Shortly afterwards the contractors delivered a statement of claim, in which they asked for, subject to the final adjustments as to retention money, etc., the whole of the balance of the money due in respect of the opera house, including the whole of the balance due under and by virtue of the sub-contracts. When the arbitration was proceeding, and the arbitrator had heard the contractors' case, it was submitted for the first time on behalf of Mr. Hammerstein that the arbitrator's jurisdiction was limited to disputes or differences in respect to the building of the "carcase" of the opera house, and that, inasmuch as there were included in the claim matters which were outside carcase work, those matters should be eliminated from his consideration. He held that the true inference from the documents and the conduct of the parties was that they intended that the conditions of the contract were to govern all the relations between them in respect of the building, irrespective of carcase work or otherwise.

LONDON COUNCILS.

The question, therefore, for the opinion of the Court was whether that finding was correct, and whether the arbitrator had any jurisdiction to deal in any way by award with any disputes which had arisen between the parties in respect of claims for work done beyond the erection of the carcase.

Mr. Beyfus explained that Mr. Hammerstein had paid the contractors £9,000, and he contended that that sum was sufficient to meet all claims.

After hearing Mr. Hutchinson the Court dismissed the appeal.

The Lord Chief Justice remarked that Mr. Hammerstein objected to the jurisdiction of the arbitrator to deal with claims for work which he said did not come within the meaning of the word "carcase," and that objection was taken four or five days after the arbitration was commenced. There was no doubt that the certificates, in fact, did include a great many items which were outside the carcase, and on the question whether the amount of the claims was right he did not express any opinion; that was for the arbitrator. In his opinion, there was no real binding contract until the drawings and specifications had been produced by the architect, and he came to the conclusion that the arbitrator had jurisdiction to deal with at least the items which were claims for work which was shown on the drawings and specifications. As to some particular claims of work not included in the specification, and as to which Mr. Hammerstein raised an objection, he would express no opinion.

Justices Channell and Avory concurred, and the appeal was dismissed with costs.

HIGH COURT OF JUSTICE, CHANCERY DIVISION. (Before Mr. Justice PARKER.)

Claim by Contractors: Messrs. J. Aird & Co. v. the Tanjong Pagar Dock Board.

THIS action came on for hearing on Tuesday, the 22nd inst.

Mr. Upjohn, K.C., Mr. Macassey, K.C., and Mr. Schwan appeared for the plaintiffs; and Sir Robert Finlay, K.C., Mr. George Cave, K.C., Mr. Romer, K.C., Sir Hugh Fort, Mr. Mathews, and Mr. Hull for the defendants.
